About the Editor

Robert L. Heath, professor emeritus of communication at the University of Houston, is an internationally recognized authority on public relations, crisis communication, issues management, risk communication, and business-to-business communication. He has published many award winning books including *The SAGE Handbook of Public Relations* (2010), *Handbook of Risk and Crisis Communication* (2009), *Strategic Issues Management* (2nd ed., 2009), *Rhetorical and Critical Approaches to Public Relations II* (2009), and *Terrorism: Communication and Rhetorical Perspectives* (2008).

Heath has 3 decades of experience in corporate communication and positioning research. He has conducted research on risks related to various hazards, including those associated with chemical manufacturing and community right to know—key themes in community relations.

In addition, he has published more than 100 chapters and articles and serves on the editorial and reviewer panels of several premier academic journals. He has received many honors from public relations professionals and academic associations and has lectured nationally and internationally on a wide array of topics.

Introduction

As I drafted the introduction for the second edition of the *Encyclopedia of Public Relations* (EPR2), I revisited the preface published in the first edition (EPR1). I did not appreciate when we produced the first edition how much of a footprint it was and how such projects help us track the movement of the discipline; the journey it is taking toward a relatively uncertain destination. Footprints suggest where a discipline has been, where it is, and where it might be going.

In such projects, we can never forget that we are dealing with a profession. People can be educated, accredited, and rewarded for the quality of their professional work. They can be scorned for engaging in spin. The question is how well academics work with professionals for the good of the profession, the organizations it serves, and the societies where it is practiced. Many of us aspire to make a strong connection between what is good for the profession and what is good for society. Like other academic disciplines and professions, we are variously chauvinistic with enthusiasm for what this profession can do for others and how it can continually be improved by tough love.

Pathways and Wanderings

Where Have We Been?

I appreciate the history of public relations every time I am fortunate enough to participate in useful projects such as the *Encyclopedia of Public Relations*. I have similar feelings when I read a truly interesting article, chapter, or book. The discipline has, and even suffers from, lots of history that is subjected to quite different interpretive lenses.

Many events and traditions have shaped the current professional practice of public relations in many countries, locales, and organizational-individual relationships. Public relations seems to

have left footprints back to the dawn of time even if it got its name (and identity as a profession and academic discipline) only relatively recently. And, all of that is changing for good and bad reasons. We have legendary figures. There are telling moments, events, and challenges. We also have entanglements with various perspectives, such as “propaganda,” and self-interested discourses and other symbolic actions of individuals (think in terms of monarchs) and institutions and organizations (think in terms of corporations, governments, and religious establishments). We even have a history where antiestablishment and other “nonprofits” engage in what can be thought of as “public relations.” It is essential that what came to be known as *public relations* is not something uniquely and originally developed in the 19th century, or in the United States. Nor is it simply a self-interested tool of powerful corporations. It cannot be set aside by substituting it for terms such as *communication management* or *strategic communication*.

Topics that were featured in EPR1 provided evidence of the culmination of a century of professional best practices, primarily in the United States and United Kingdom. It also reflected a research tradition, among academics, that was launched tentatively in the 1970s. By then, as well, there were well-established national and international professional associations specializing in the field and promoting practice-oriented research. Early research often was commissioned to help practitioners do what they wanted to do better. They wanted to refine their skill sets.

Where Are We?

I think the answer to that question is “pretty well along,” as is evident by the scope and depth of topics covered in this edition. It covers some of the same ground and even reprints approximately

150 entries from EPR1. But, we revised more than 190 others from EPR1 to keep them current. We added about 160 new entries and have included an appendix on Women Pioneers in Public Relations. All of that text, especially the new additions, constitutes an advance that serves as evidence of the dynamic state of scholarly and practitioner interest in the current health and challenges of the discipline. So, we see well-defined footprints as evidence of lots of participants in the discussion, both professional and academic.

For EPR2, we added many topics relevant to *new media* and what is generically titled *critical studies*. The first is important because new media deterministically reshape the communication landscape. The latter topic is important because it offers a very robust dialogue and wonderful insights that are shaping the character and worth of public relations and social responsibility of its professional practitioners. We are not only interested in how it can help organizations wisely and ethically to achieve their missions and visions (that pathway is well established), but we also are increasingly committed to the paradigm that the practice is best when it helps make society more fully functioning. This trend seems well grounded in a shift from a compulsive focus on organizational effectiveness to a broad discussion of how the organization can only be effective in its community, as it is constrained and supported by the cultures of the societies where it operates.

Such outcomes presume that we are making progress in the effort to understand the “public relations processes” that are unique to and vital for the practice as a unique, definable aspect of the human experience. So, such focus keeps us mindful of what we are studying and why. But, and here is a major advance, we are increasingly aware of and focused on the “meaning(s)” created for better or worse by social construction fostered by the multiple voices ringing out in society.

For these reasons, EPR2 offers insights into voice, culture, dialogue, discourse aspects of relationships, co-created meaning, constituted meaning, and dozens of other topics. We have moved beyond the simplistic models and commitment to systems theory that was current in the 1990s; changes in the scope and depth of the profession have come as a response to the challenges that

were confronting the public and private sectors as a result of the turbulent 1970s and 1980s. Much of this turbulence accounts for the new public relations paradigms that emerged in the last part of the 20th century and 95% of the topics and research projects that attracted an increasing number of interested and well-educated scholars to the fray.

Most discussants of theory and practice realize that push-button approaches to the practice and theory (and their companion research) are interesting but only a step, a footprint, not the end of the journey. Theories that offer a push-button approach (“take two aspirins and call the doctor”) still play a role in the profession, but the footsteps of a lot of competing positions are kicking up dust. As paradigms have shifted before, they seem certain to do so continually. And, in place of buttons to push, there seems to be a commitment to achieve sound and defensible principles that can, and will, guide professional practice.

Terms such as *control*, *power*, *social responsibility* and *public relations ethics* are seen as rich areas of study and continual refinement rather than settled matters. In part, for that reason, this edition offers substantially deeper and broader discussions of crisis and risk communication, as well as the complexities of power, control, and other similar aspects of the human condition that are thought of by some theorists to best be viewed through a colonial (or postcolonial) perspective.

One can see, embedded in each statement that presumes to tell us where we are, the marks that point the path forward. As such, we invoke a variety of metaphors to capture the state of discussion. We might, for instance, see the path leading to completed and furnished edifices or going into more fog—but with a variety of lanterns to keep the journey from wandering badly. Do we know what the “edifice” is that we are finishing, or are we still in search of its floor plans and blueprints? Do we have a guiding sense of what makes a society fully functioning? Have we firmly staked the foundation of the profession in ways that reflect sound knowledge of and appreciation for its position in the history of human society?

In EPR1, I cited Rex Harlow who is the subject of an entry on his life and contribution in EPR2. Writing in 1977, he observed the following, which again is worth reconsideration:

A review of the history of the definition of public relations shows that the definition has changed considerably over the past 70 years. This historical review reveals how inextricably the development of the definition has been and is bound to the movement of thought and action of the society in which the public relations practitioner does his [or her] work. It shows the present form, content and status of the public relations definition, but even more the effect of environmental factors and change upon its development during the past quarter of a century. (p. 49)

The changes, revisions, additions, and deletions made to EPR2 are, we hope, a result of a wise, judicious, and insightful exploration of the “movement of thought and action of the society” that this work must serve.

Where Do the Footsteps Lead?

We recognize that there is a bias to the U.S. view of public relations in this second edition. That is a function of the number of authors who work and write in the United States. But, despite this inherent bias, and one that is too complex to solve easily, we have added lots of topics that suggest a much more global and complex approach is being devoted to important matters. Thus, instead of only seeing these matters from a U.S. perspective, we try but know that we fall short of the goal of seeing the globe of public relations as the astronauts see the earth.

One of the major advances in EPR2 is to have more authors educated outside of and independent of the U.S. paradigm. Nevertheless, we have a lot of U.S. educated authors, and it is true that the professional practice during the 20th century had a U.S.-centric character to it. Most of the authors contributing their work in *Public Relations Review* and *Journal of Public Relations Research* in the last decades of that century were from U.S. universities and professional practices. We had a generation of U.S. faculty members going abroad on proselytizing missions touting “their” view of public relations as “the” view. At the same time, scholars working outside of the United States wanted to write on topics and in ways that were not welcomed into these leading journals.

One can aspire, however, to find and continue on the path of research and practice in ways that

help us imagine that EPR3 will move ever more away from a U.S.-centric view to one that is more richly global. My experience, however, is that such shifts tend to move more like tortoises than hares. But we should be heartened to recall that the tortoise beat the hare.

Despite the sense that footprints lead in different ways, become blurred, and often wander off in unproductive directions, it is rejuvenating to see all of the footprints in EPR2 as a “state of the discipline.”

The DNA of Public Relations

The array of authors whose voices are heard in EPR2 suggests that no matter how insightful and prescient one researcher and theorist’s voice might be, change is necessarily going to occur discursively and preferably collaboratively. Some persons are likely to think that all of the points of view and opinions, the preferences expressed, are a jangle and a wrangle. But the engagement of interested parties can never be stopped, especially by edict or insistence. Nor do we doubt that however inefficient the process is, it is enriched by engagement, dialogue, debate, as well as temporary misstarts and false directions.

The DNA of public relations is inseparable from the effectiveness of some individual or organization (or both). The assumption defining public relations is well established that skilled and effective public relations (and practitioners) can help make organizations and individuals more likely to succeed. It’s unlikely that such linearity will cease to be the aspiration of professionals and most academicians.

Such logic can give public relations an institutional bias, hence the adherence of some variation of institutional theory. It presumes, as a skilled automobile engineer and a mechanic do, that having an automobile well designed and mechanically fit makes it more successful as a tool to serve someone’s plan to get from point A to point B. Such logic, however, can miss the point that however seemingly desirable such an aspiration might be, the complexity and chaos inherent to the world and human existence argue for flexibility, variety, and adaptability. It is likely to presume, as well, that no matter how many variables are carefully inspected and how well matters are understood, complexity will prevail. Principles are likely to be more useful than prescriptions.

For that reason, the functional, tool-like approach may feature concepts such as mission and vision, goals, objectives, strategies, discipline-specific structures and functions, as well as tools and tactics. This view of public relations is given full-throated support in this edition. But, set against such linear analysis, ignoring complexity and critical perspectives, the “functional” view demands contingency. It presumes that discourse processes and symbolic behavior not only responds to uncertainty but advances through uncertainty—with caution and even luck. This cautious view continues to make inroads into theory and practice that recognize the processes unique to the profession and to the skilled and perhaps ethical implementation of the profession’s defining functions and structures. But, it also suggests that humans are sentient and complex; ethics are contestable matters. Policies, public and private, are dynamic—“under construction.”

EPR2’s examination of the DNA of public relations reasons that the structure and function approach cannot explore, explain, and expand the role that meaning plays in the human condition, including within the care of public relations. Does public relations play a role in societal discourse? Is it a relevant player in how societies individually driven and collectively managed create and instantiate ideas? Is the human being capable of being reduced to processes, or is the nature of humanity in each of its configurations buffeted by socially constructed meanings and variously dynamic identities? Do humans create powerful meaning structures that guide behavior based on seemingly enlightened choices, define and enact relationships and associations (along with inherent dissociations), and supply the resources of power and control as stakeholder exchanges? Do words and other symbols become the reality that humans live, and by the standards of contestable social responsibility? Do humans use words to give themselves the power to bend matters to their interests? Is reality, under such circumstances, recalcitrant and discourse partners contentious? Is their identity merely the enactment of process and behavioral adjustment? Perhaps, and that can account for the success of ants.

But are humans, for better or worse, wordy animals whose discourse, dialogue, and rhetorical enactments shape society, relationships, cultures,

and world views that justify or deny the legitimacy of organizations, actions, and even individuals? How much power is there in the words *parent*, *president*, *king*, *relationship*, *collaboration*, *cooperation*, *consensus*, and on and on? How is power reshaped by terms such as *gender*, *race*, *sexual orientation*, and political assumptions such as *democracy* and *terrorism*?

As one reads the entries in EPR2, noting the breadth of coverage, we hope there is an incentive to recognize and appreciate processes but also to realize the rich importance of meaning for humans as sentient beings. Both (processes and meanings) are important aspects of the DNA of public relations; in that discussion and balance, each author and practitioner might be biased one way or another. But neither side of that quandary can be dismissed or ignored, but rather should be enjoyed for what it offers and where it falls short.

The DNA of public relations is its role and service to others. It lacks separate integrity independent of its roles. For that reason, the question is not what it does for itself—but how it serves and who it serves. Who is its master, or is it master of its own fate? Does it make individuals and organizations more effective? Does it serve to make society a better place to live and organizations a better place to work? Does it help people to know what *better* means and how it can be achieved?

For this reason, the discussion of interests or identities is not a trivial or an indifferent matter for those interested in the practice and research of public relations. They are central and definitional to the human experience as products of the cultural webs in which people entangle themselves. The practice, research, and theory of public relations are limited or enriched by how interests are defined and by the terms that are used to modify that concept. Thus, the DNA of public relations asks us to consider not how public relations operates in a disinterested way, but whose interests are advanced, and whose might be harmed?

Public relations’ nature—its character and legitimacy—and its role in society depends on the interests served, and how. If it is “an” or “the” unseen power, as Scott M. Cutlip (1994) reasoned, it is worth studying for the possibility, probability, or certainty such is the case. As being relevant to ideas that drive process, and processes that shape ideas, public relations can make organizations and

individuals successful in ways that can help or harm the greater interests of community, a society of many levels and interdependencies. It is, as a profession, then central to how outcomes are achieved and what outcomes are successful—and why so. It can, especially as an academic discipline, understand, correct, and support certain ideas and practices as normatively better than others. But it can never, whether as practice or academic study, divorce itself from society.

Because of public relations' ability to help shape and reshape society, which presumes insights into the dynamics of society, David McKie and Debashish Munshi (2009) offered a challenge to the discipline.

No discipline is an island. Public relations education cannot be independent of, or be indifferent toward, the society in which it operates. Without a sense of the different ways that society might be theorized, public relations students and practitioners are limited in their participation in broader dialogues about how public relations contributes to public communication. It is not enough to be technically proficient without being able to make informed contributions to debates about contemporary society and its future development. (p. 61)

By this claim, McKie and Munshi, and they are not alone, aspire to a time when public relations is not viewed as a negative force in society, but something quite positive through its wise and ethical influence on managements and the ability to foster discourses and ideas that help make society the best community that it can be. It is a means by which the human spirit couples with professional practice to truly make society an instrument for the collective management of the risks and self-interests of human society.

Acknowledgments

People like to talk about teams. Some even claim, “there is no *I* in *team*,” even though they miss the point that the word *team* contains the letters *m-e*. So, let me say that I (me) could not have done this project without lots of *I*'s.

A project such as the design, development, and production of the second edition of the *Encyclopedia of Public Relations* is a team effort. As such, it requires a lot of *I*'s and *me*'s setting aside other projects to pitch in. Perhaps violating the spirit of no *I* in *team*, I'm going to express my (a variation of *me*) gratitude to many who helped bring this project to fruition.

First, I acknowledge SAGE acquisitions editor Jim Brace-Thompson who came to me and said, “Because of the success of the first edition, we would like to do a second.” That actually was an exhilarating opening line of the drama that culminated in the production of this edition. In that regard, *we* as a discipline also need to acknowledge the librarians and others who believed that the cost of the work was money well spent. That is hugely gratifying.

Second, I acknowledge SAGE's willingness to let *me* pick and invite a first-rate advisory board. As important as that ever is for an editor, this time it was INVALUABLE. I simply did not know a lot of entries and authors that should be selected and invited to contribute because of the expanded array of topics. The entries on new communication technologies, which were recommended by older colleagues and written by younger ones for the most part, enriched this work. The new technologies are a playground and perhaps stumbling blocks for public relations practitioners, and seem best understood as such by our younger colleagues.

Also, I appreciate the Advisory Board members who offered topics and contributors generically under critical theories. I knew just enough to realize what I did not know and appreciate. I did not

know who to ask who would be willing and able to write on what are often quite complex topics.

Third, I appreciated the advice and guidance on topics that fall under the headings of feminism, race, gender, and ethnicity—what seem to be identity topics. That sort of topic is definitionally the nature of societies and cultures. It, and other topics similar to that, are not matters of political correctness. They are core elements of society where public relations is enacted and where it can help or hinder such persons' narratives. The nature of that stew determines how good the meal is. That appreciation, by definition, extends as well to those who helped to give a much more global topic structure and content for *Encyclopedia of Public Relations, Second Edition*. Several of the Advisory Board members also edited entries as they came in and went through various iterations before going to publication.

To each of the Advisory Board members, you are welcome to see your role as generously in the contribution to the final project as you wish.

I acknowledge so many colleagues who might have been doing any number of activities if not writing entries for an encyclopedia. I believe the culmination of the product and its contribution to academic and professional work are rewarding.

Finally, I acknowledge the SAGE team. Carole Maurer, senior developmental editor, raised and then helped solve hundreds of editorial challenges. She made my work look, and be, easy. I acknowledge the patience and precision of Anna Villasenor, reference systems coordinator. SAGE developed an SRT (SAGE Reference Tracking) computerized system. We used a version of it in the development of the first edition of the *Encyclopedia of Public Relations*. The new and improved version is super. But, for so many of us, a computer system is at times horrid and daunting. I appreciated a thorough tutorial one afternoon to get me ready to

help make it work. Then, some days later, I started to “make it serve *me*.”

Thank you, Anna, for being one of those who walked *me* through the SRT, both during the orientation and again and again. You made it work for us and did so with such a sense of fun and patience. I found all of the SAGE personnel to have a good sense of work and enjoyment for the project. But Anna and I got into the easy habit of everyday banter as Monday arrived, and she saved me once again as Friday arrived. Anna, I enjoyed working with you. And I would also like to thank Tracy Buyan, project editor, and Diane DiMura and Janet Ford, copy editors.

In the Acknowledgments to the first edition, I noted how the process of pulling off an encyclopedia together is similar to that of the barn raising in the movie *Witness*, starring Harrison Ford. I imagine that many of the younger authors don't remember that movie. One scene focused on the harmony in an Amish community where everyone young and old, male and female, played a key role as all hands helped raise a barn and nourish those hard at work. That sort of collaboration, cooperation, and camaraderie characterized the crafting of *Encyclopedia of Public Relations, Second Edition*. Our team really clicked.

Robert L. Heath

A

ACCOMMODATION: CONTINGENCY THEORY

Accommodation occurs when public relations practitioners through dialogue, negotiation, and compromise attempt to meet the needs of both their organization *and* a stakeholder group. Contingency theory defines pure accommodation as the polar opposite of pure advocacy in public relations. Pure accommodation can also be termed *capitulation*—when an organization accedes to a public’s demands. Pure advocacy occurs when public relations practitioners attempt to meet the needs or desires of their organization *or* a stakeholder group to the exclusion of the needs or desires of the opponents of the position being advocated. Typically, advocacy refers to the practitioner’s role in representing his or her employer, whether an organization or a client.

Accommodation is a stance or strategic position that a public relations practitioner may choose to take with a public. It is most appropriate when the stance is mutually beneficial for the accommodating organization and the accommodated public.

Accommodation is a central tenet of contingency theory. The contingency theory of accommodation in public relations was introduced in 1997 by a team of researchers led by Glen T. Cameron. Contingency theory posits that ideal public relations practice is constantly influenced by more than 80 variables ranging from the experience of the public relations staff to the credibility of a contending public.

An accommodation continuum ranging from pure accommodation to pure advocacy was developed to illustrate contingency theory and the dynamic nature of public relations practice. Cameron and associates argue that at any particular time a practitioner’s position may shift toward or away from accommodation or advocacy, depending on the presence of influential internal or external variables. Contingency theorists claim that there is no one-size-fits-all normative approach to public relations practice. Evidence that contingencies affect accommodation in *normative* public relations practice is the primary contribution of contingency theory.

Accommodation is compared to two-way symmetrical public relations practice, whereas advocacy is compared to asymmetrical practice. Symmetry and asymmetry are concepts articulated by James E. Grunig (2001) as the essence of the Excellence study.

The role of accommodation in public relations was tested through empirical research, such as interviews and surveys of public relations professionals. The research confirmed that accommodation is usually not the default response in public relations practice. Advocacy is the default. As a situation changes, the most effective practice is dynamic, moving between accommodation and advocacy.

In testing the concept of accommodation, the Cameron team used in-depth interviews to examine variables that affect the level of accommodation by an organization. Practitioners at larger corporations reported that the corporation’s size

often made them more likely to accommodate a powerful external public, such as consumer activists. Corporate culture variables, for instance the position of the CEO in a specific public relations situation, were also identified as potentially strong influences on the level of accommodation. Accommodation is also shown to be affected by predispositions or emotions of organization leaders and/or stakeholders involved in an issue.

Contingency theory also suggests there are ethical implications to accommodation. Contingency theorists argue that there are times when it is ethically inappropriate to accommodate a public. For example, researchers asked whether it is ethical public relations practice to accommodate the demands of a dictator. Furthermore, as a paid representative of your organization it is undesirable, if not unethical, to accommodate an activist group focused on the elimination of your business. For instance, animal rights activists and furriers have goals that are diametrically opposed to those of the fur industry, so accommodation of the activists by that industry is unlikely.

Accommodation in public relations is a useful concept for professionals to consider as they engage in organization-public relationships. The stance of accommodation drives strategies and tactics and is therefore a valuable variable to consider in building or maintaining relationships.

ACCOUNT EXECUTIVE

The term *account executive* (AE) refers to the practitioner within an agency or public relations firm who is responsible for day-to-day contact with a client or clients. As such, the AE is responsible for managing all agency-client initiatives, including publicity, press relations, special events, crisis communication, the creation and production of communication messages, and media buying and placement. In many instances, AE or assistant AE is the title of an entry-level position in public relations agencies.

In the earlier days of the profession, the AE's function was as the agency's liaison with a client or clients. It was the AE's job to represent the agency to the client. However, in today's consumer-driven environment, the AE is seen as functioning best as the client's representative within the agency. In that role, it is the responsibility of the AE to ensure that the interests of the client are foremost in all initiatives undertaken by the agency on behalf of the client.

Activities performed by the AE include the following:

- Developing and maintaining expertise in the client's business and industry
- Understanding the structure and policies of the client organization
- Scanning the economic, political, and social environment for challenges and opportunities vis-à-vis the client
- Maintaining an ongoing base of information for the client concerning their competitors
- Developing relationships at a minimum of three levels within the client organization
- Acting as consultant to the client with regard to communication planning and implementation,

including advertising, media relations, Web content, media planning, and other activities

- Maintaining day-to-day contact with the client's representative(s) to maintain goodwill and keep the client "in the loop" regarding all activities on its behalf
- Representing the agency at client meetings
- Coordinating activities with the agency's creative director and media director as appropriate
- Monitoring and protecting the agency-client relationship
- Working with the client to develop planning documents
- Summarizing agency-client meetings for distribution within the agency and the client organization
- Ensuring that all creative messaging and other initiatives are fully supported by the client prior to implementation
- Making certain that all members of the agency team assigned to the client's account understand the needs of the client and act accordingly
- Ensuring that all creative is "on target" (*creative* refers to any contracted text, graphics, pictures, and other tactical tools that are crafted for each client)

However, the central focus of the AE has always been—and always will be—to effectively and efficiently manage the relationship between the client and the agency in order to protect the interests of both and to ensure mutual benefit. Moreover, the agency tenure of an AE is directly linked to the maintenance of that relationship.

The appropriate educational background for this position includes public relations, advertising, or journalism.

ACCOUNT MANAGER/ACCOUNT MANAGEMENT

The term *account management* refers to the coordination, billing, and evaluation of all activities undertaken by a public relations agency or firm on behalf of a client or client organization. Unlike the account executive (AE) who is in day-to-day contact with a client, the account manager (AM) is a higher-level planner and coordinator working with various AEs and creative and media directors within the agency environment to assess the future needs of the client, to develop strategic plans to meet those needs, and to put in place evaluation strategies to determine the success or failure of programmatic initiatives. In agency tradition, AEs report to AMs. A central concern of the AM is to look for opportunities to grow the agency's business through the expansion of current work undertaken for the client or by working with the client to develop new initiatives. Moreover, the AM may be responsible for several accounts at the same time.

As a senior member of the executive team, the AM also is responsible for initiating, nurturing, and maintaining mutually beneficial relationships between the agency and the client. Research indicates that these relationships follow a familiar pattern of growth and decline. The effective AM must understand and appreciate this process, be able to recognize the current phase of the relationship, and if necessary know how to alter that relationship to ensure that it is positive. Moreover, research demonstrates that the dimensions of openness, trust, involvement, commitment, and investment are crucial in managing the agency-client relationship. In this context, "openness" is the degree to which the agency and the client share plans for the future with each other. "Trust" refers to the degree to which the agency or the client follows through on their words with their actions. "Involvement" refers to the willingness of the agency to become actively involved in the business of the client. "Commitment" addresses the need to demonstrate an ongoing interest in helping the client organization achieve its goals. "Investment" concerns the amount of time and energy the agency is willing to put into maintaining the agency-client relationship. A simple

“relationship audit” can provide an illustration of the state of the agency-client relationship as well as indicate areas for improvement.

Despite a substantial increase in the number of AM positions, many companies continue to report dissatisfaction with the ability of the AM to build sustaining relationships with strategic clients. To a large degree, responsibility for the inability to sustain a relationship is claimed to rest, not surprisingly, with the selection of a client. This breakdown in the client/agency relationship usually can be traced to a “poor fit” between the agency’s interests and the client organization’s business.

ACCREDITATION

In the practice of public relations, as in many other fields, accreditation is a credential of expertise, competence, and ethical practice. For instance, the use of the initials “APR” after an individual’s name gives increased credibility as it designates that person as Accredited in Public Relations. It is common to see APR, Accreditation in Public Relations listed as required or preferred among the criteria posted in public relations position announcements. The APR postgraduate certification program was established

in 1964 and has been completed by more than 5,000 public relations professionals.

How does a public relations practitioner become accredited? The process includes application, studying a prescribed body of knowledge, meeting with a readiness review panel, and passing a computer-administered examination. The readiness review panel involves the review and discussion of a candidate’s portfolio. Successful completion of the process recognizes competency in the knowledge, skills, and abilities required to practice public relations effectively.

Competencies tested include the following:

- Researching, planning, implementing, and evaluating programs
- Ethics and law
- Communication models and theories
- Business literacy
- Management skills and issues
- Crisis communication management
- Media relations
- Using information technology effectively
- Knowledge of both historical and current issues in public relations
- Advanced communication skills

“Accreditation is one of the most important credentials a public relations practitioner can achieve,” said Susan G. Barnes in a personal communication on August 23, 2012. She holds an APR accreditation, is a member of the College of Fellows of the Public Relations Society of America (PRSA), and is vice chair of the Universal Accreditation Board (UAB), the organization that manages the granting of the APR designation. “Accreditation assures potential employers that the practitioner brings a certified level of expertise to an organization. More and more employers are recognizing that accreditation sets job candidates apart and are actively seeking accredited public relations professionals.”

The UAB is composed of several participating professional organizations: the PRSA (the largest professional organization devoted to public relations), the Agricultural Relations Council, Florida Public Relations Association, Maine Public Relations Council, National School Public Relations Association, Religion Communicators Council, Southern Public Relations Federation, and Asociación de Relacionistas Profesionales de Puerto

Rico (Puerto Rico Public Relations Association). The UAB develops the APR examination and policies, while the day-to-day management of the program is conducted by the PRSA. The application, reading list, and downloadable study materials are available on the home pages of the UAB and PRSA.

Other professional organizations also offer an accreditation credential. For example, business communicators may earn the distinction of being an Accredited Business Communicator (ABC) through the International Association of Business Communicators. The Canadian Public Relations Society also offers an accreditation program for individual public relations practitioners. Various groups have differing requirements for years of experience before candidates may take an accreditation examination. The past requirement for at least 5 years of experience is no longer imposed for candidacy for the Accreditation in Public Relations.

Accreditation is one measure of professionalism for public relations practitioners. Other measures include obtaining appropriate educational training, participating in continuing education classes (offered through professional associations), conforming to ethical standards, such as those included in the PRSA Code of Ethics, and maintaining a fiduciary relationship with employing organizations and clients—that is, acting in the best interest of the client or employer. This relationship is similar to the trust one may have toward one's physician, dentist, or attorney—the assumption that they, as professionals, will act in the best interests of all parties.

The programs discussed above are for accreditation for individuals. Accreditation and certification programs also exist for academic programs in public relations. The Public Relations Student Society of America (PRSSA) established the program for Certification in Education in Public Relations in 1989. Through this program, colleges and universities may request independent review and endorsement of their public relations education programs to validate that they meet the high set of standards set by the PRSSA. Achievement of the Certification in Education in Public Relations gives increased credibility and visibility to academic programs in public relations. Similarly, some public relations academic programs are housed within journalism or mass communication programs that are accredited

through the Accrediting Council on Education in Journalism and Mass Communications, or ACEJMC. Information on these programs is available on the PRSSA and ACEJMC home pages.

In support of the APR credential program for individuals, many local chapters of the PRSA organize study groups. Local PRSA chapters have accreditation chairs and cochairs who help interested professionals navigate the process. With accredited panel members serving as advocates of the candidate, the accreditation chairs arrange readiness review panels when candidates are ready to proceed, helping to assure that they are ready for the comprehensive examination administered at test centers throughout the United States. Candidates who participated in this process mention multiple benefits, such as increased understanding of the skills used in their career, increased credibility with their employing organization, and job opportunities resulting from the recognition.

Accreditation is often described as an alternative to licensing in public relations. Proponent Edward L. Bernays long argued for licensing as a means for protecting professionals. He believed that licensing assured that they had the knowledge, talent, and ethics required of professional practice. However, industry leaders generally agree that even after decades of debate on the issue, requiring a license to practice public relations seems unlikely; therefore, public relations practitioners may instead earn Accreditation in Public Relations.

ACTIVISM

Activism is the process by which special interest groups of people exert pressure on corporations or other institutions to change policies, practices, or conditions that the activists find problematic. Activism has generally been seen as one of the catalysts for the growth of the public relations profession, because some of the most significant periods of development in the field featured high levels of activism. More recently, both to make their case and to sustain their organizations, activist organizations view public relations as necessary. Activists generally practice public relations “from the bottom up,” using the strategies and tactics of the field to achieve goals that are not that dissimilar from those of other, more institutionalized organizations. This entry discusses the development of both public relations and activist movements, activists’ use of public relations strategies and tactics, and corporate responses to activism.

Activism and the Development of Public Relations

Activism has been one of the catalysts for the development of public relations throughout the field’s history. Timothy Coombs and Sherry Holladay (2012) suggested that activist organizations were using public relations techniques before the inception of what might be considered corporate public relations.

In the late 19th century, progressive and populist groups in the United States sought to limit the power and scope of monopolistic organizations. The press, partially prompted by activists, sought to reveal problematic conditions caused by corporate practices. Groups seeking reforms pressured organizations through either direct confrontation or increased government regulation. In response, corporations hired the first public relations counselors to tell the organization’s story. For example, Ivy Lee was hired by the Rockefeller family to help craft responses to labor activism.

During the 1950s and 1960s, American corporations were again forced to respond to a wave of activism. A number of significant activist movements reached their peak of influence and public

attention, including women’s rights, civil rights, consumer safety, environmentalism, and the anti-Vietnam War protests. Corporations turned to public relations professionals to anticipate problematic situations and to engage in public debate with activists. Scholars and practitioners alike began to examine the development of activist organizations and the tactics they employed. Activists, as well, began to notice the need for a more sophisticated approach to communicating both with supporters and opponents. For example, Saul Alinsky’s 1971 book, *Rules for Radicals*, offered practical communication suggestions for activists.

In the first part of the 21st century, activism took several forms. Many of the reforms sought by 1960s activists were enacted into law or regulation, spawning government agencies, such as the Consumer Product Safety Commission and the Environmental Protection Agency. However, activists continue to raise issues and monitor the performance of these government agencies. Activism is embraced by a variety of publics with a sometimes dizzying range of agendas. In the United States, the most notable among these are the Tea Party and Occupy movements. Today, there is such a broad range of empowered activist groups that virtually no corporate decision can be made without taking into account the likely reaction of at least one special interest group.

As with most other communication functions, mobile digital technology and social media have revolutionized activism. Activists use Twitter and text messages to organize collective action. This trend has necessitated an increasingly sophisticated response on the part of organizations engaged by activists. According to excellence theory (Grunig, 1992), activism is so closely linked to important developments in public relations that it is now seen as one of the preconditions for the presence of public relations programs.

Development of Activist Movements

Activism generally arises when members of a public perceive some problematic situation, which often entails challenges to an organization’s legitimacy—thus producing a legitimacy gap. Sociological explanations of activism identify major social divisions, such as race, gender, or economic differences, as the preconditions for activism. This view

also privileges ideological motivations for activists. From a public relations perspective, however, it is more accurate to say that activists are driven by issues.

When an organization appears to be responsible for something that harms the public, activists normally respond with a call for some corrective action. For example, the NIMBY (“not in my back yard”) phenomenon often pits otherwise docile community members against organizations that they see as creating problems in their communities.

Activist movements tend to evolve through various stages of development. At each stage, the organization faces various communication and organizational challenges. One fertile area of research is the identification of the various stages in the “life cycle” of activism. For example, Robert Heath (Heath & Palenchar, 2009) identified five stages: strain, mobilization, confrontation, negotiation, and resolution. These stages are not dissimilar to the various life cycle models discussed in issue management.

Activists’ Use of Public Relations

Activists use public relations strategies and tactics to pursue two general goals. The first is to influence public opinion and behavior to rectify the situation they see as problematic. The second is to create and maintain organized, structured, and coordinated efforts. These goals are not that different from those of other organizations, which use public relations both to pursue their strategic goals and to maintain the organization.

The area that has received the most attention from practitioners and scholars is examination of the strategies that activist groups use to pursue their goals. The iconic images of activists tend to involve mass protests or violent demonstrations. However, activists use a variety of strategies and tactics to pursue their goals. Some tactics are confrontational, including boycotts, demonstrations, and symbolic events, which are often designed to dramatize an issue or galvanize public attention.

Other strategies are more informational, designed to raise awareness and increase understanding of an activist group’s issues and proposals for resolving those issues. These tactics typically involve media relations, including news conferences and interviews. Groups with sufficient

resources can run issue advertisements. Websites allow activists not only to provide a great amount of information about their issues but also to direct members and others on how to take action to promote policy solutions.

The final set of strategies employed by activists involves building relationships with the institutions or organizations that the activists hold responsible for a problematic situation with the goal of negotiating an outcome satisfactory to all parties. As is true of a corporation’s use of symmetrical approaches to public relations, this approach is not as widely practiced as the ones described previously. As with other strategic public relations practices, the strategy that activists select depends on how those who run the organization value the role of public relations. Often, the choice of strategies is reactive and prompted by the response of the target of the activists’ efforts.

Activist groups use public relations strategies and tactics not only to promote their causes but also to maintain their own base. An activist group must recruit members, gather resources, and establish the organization as a legitimate advocate for an issue. In addition to gaining public attention for their issues, activists also create communication networks designed to alert members to coordinated action, from organizing rallies and training sessions to urging people to contact elected officials regarding legislation.

Over the course of long campaigns, specifically during the confrontation and negotiation stages, activist groups must maintain member motivation. They also have to compete for members and resources with other activist groups pursuing similar issues. As issues are seemingly resolved and thus fall lower on the public agenda, activists often see membership and financial resources decline. Sometimes activist groups cease to exist altogether.

Activists use a variety of internal tactics, including newsletters and websites to maintain contact with followers, sustain interest in issues, or redefine the group’s issues to those that are higher on the public agenda.

Corporate Responses to Activism

Despite the importance of activism to the development of the field, public relations practitioners or

scholars do not universally value or respect activists. The strategies used by organizations in response to activism run the gamut from attacks and resistance to the formation of cooperative relationships. Christine Oliver (1991) outlined five strategic responses that organizations typically adopt toward activists: (1) acquiescence, which involves giving in to the activists' demands; (2) compromise, which occurs when the organization negotiates with activists to resolve problematic situations; (3) avoidance, which is through concealing problems or otherwise erecting barriers between the organization and outside pressure; (4) defiance, which involves actively engaging opponents in debate, challenging new regulations or proposals for change, or attacking the organization's opponents; and (5) manipulation, typically through co-optation, which involves making cosmetic changes to an organization's practices without changing their substance.

The shape of an organization's response to activism depends on the assumptions of each company's managers toward both public relations and the activists or their organization. Many organizations resist being "managed from the outside" and thus resist pressure from activists.

ACTUALITY

An actuality is an audiotape recording of a human news source that is intended to be played as an integral part of a news story prepared for broadcast in an electronic medium and provided through media relations. The term is often used interchangeably with *bite* (or *sound bite*), although purists among media workers consider the two terms distinct both in their definitions and proper use. Specifically, the second edition of the *Broadcast News Writing Stylebook* (Papper, 2002, p. 93) notes that *actuality* is a radio term whereas *bite* is a television term. Of course, the latter would include video.

Nevertheless, those in radio today commonly use the term *sound bite*, so any subtle distinction may be lost on many electronic media news people. Common usage in television coverage of politics also seems to have popularized the term *sound bite* among the lay public, whereas *actuality* seems to be a term that is used and understood almost exclusively among media workers.

Both *actuality* and *bite* (*sound bite*) describe the actual sound of someone talking as a part of a news narrative; for example, the recorded speech of a source from the public relations practitioner's organization who is a newsmaker or who is being used as a secondary source for a news story. An actuality is analogous, indeed, equivalent to the use of a direct quote in print media and thus adds credibility and interest; furthermore, a colorfully expressed actuality often provides a unique—and highly effective—means to emphatically express a fact or point of view. It serves to provide the content of interviews conducted strategically as a communication tool.

An actuality can be part of a story narrative prepared by an electronic media journalist to be aired on a newscast, but this type of recording is often included in a media release prepared by a public relations practitioner specifically for submission to electronic media as an information subsidy for broadcast news programs.

Actualities or bites are to be differentiated, nevertheless, from natural sound, background sound, ambient sound, and other types of sound that may be used as background under the voice track of a reporter or news source. Such background sounds can give the listening/viewing audience a sense of being at the news site, but do not include recognizable, or at least primarily important, speech.

Regardless of the end use of the actuality, there are a number of situations where a public relations practitioner must use caution when preparing and coaching their organization's people to act as a source for actualities: whether it is being produced as an insert into a news release to electronic media, whether the source is a speaker at a news conference being hosted by the practitioner's organization, or whether the source is simply participating in an unexpected interview sought by an electronic media news reporter because the representative is a credible or important source involving the practitioner's organization.

When a public relations practitioner produces an actuality, the utmost care must be taken to exercise technical excellence in recording the spoken words. Poor technical quality may prevent an actuality that accompanies a news release from being used by electronic media or, at best, will detract from the message that the source is trying to convey.

to announce upcoming meetings, performances, speeches, sports events, news conferences, fundraisers, hearings, rallies, conferences, and other activities. The goal is to tell people about the issue or event in an interesting way to provoke their interest and participation. A good practitioner avoids hyperbole, which puts people off—particularly the editors who decide whether or not to publish the advance.

A good advance begins with the issue or event's main topic (what the speaker plans to say or the main agenda item), the main purpose (to raise funds for a charity, for example), or a key personality (such as the star of a musical performance). This is followed by the time, day (date), and place (with room number) of the event. An advance also reports the exact name of the group holding or sponsoring an event, background information about the speaker or primary issue, other important items on the agenda for a meeting, and mention of other key personalities.

An advance for a print publication or website typically is no more than two or three paragraphs in length. This allows an editor to slip it in almost anywhere in a newspaper, newsletter, magazine, or webpage. An advance for broadcast typically is approximately 25 words and is written as a public service announcement. The advance can also fill space during a broadcast. An advance writer must always remember that a release that doesn't get published or aired is worthless.

Before 1995 or so, advance stories were mailed or faxed to newspapers and broadcast outlets; the distribution process today is more sophisticated. Advances may still be mailed or faxed to local news media, but some editors prefer to receive advances electronically. A writer creates the advance in a word processing program, pastes it into an electronic mail message, and sends the story. A recipient can then copy the advance into his or her own word-processing program, and no retyping is required.

An advance writer also can bypass the middleperson by posting all advances in prominent positions on the organization's website with links to a speaker's biographical information, background material to be discussed at a meeting, and other relevant information. It's a good idea to send advance stories to interested parties on listservs (electronic mailing lists). News media writers may

ADVANCE

An advance is a story that public relations professionals and others send to the news media

be on the listserv, but the list will include names of people who are simply interested in the organization's activities. Advance writers should make sure their lists are accurate and current, for this is a good way to get the advance to the people most likely to attend the event. This tool can be used in other contexts to alert the public to events, such as announced groundbreaking ceremonies.

ADVERTISING

Advertising, as a tool used in public relations, involves the purchase of paid space or time in newspapers, magazines, radio, television, out-of-home media, the Internet, or mobile applications to communicate messages to target audiences. More broadly, advertising encompasses an array of ancillary tools to promote interest in products, services, organizations, candidates, or causes. These include *direct response* (e.g., direct email) and *sales promotion* (e.g., point-of-sale materials, collateral, sweepstakes and contests, advertising specialties, and special events). Advertising can be contrasted with *publicity*, that is, unpaid coverage in the news or entertainment portion of media.

Public relations practitioners use advertising when they want control over a message, including when and where it will appear. In contrast to publicity and other public relations techniques, audiences often are skeptical about advertising because they attribute its purpose to persuading rather than informing. As a result, people often avoid, resist, or discount advertising messages. This entry discusses types of public relations advertising as well as advertising messages, formats, and media planning.

Types of Public Relations Advertising

Public relations advertising takes several forms.

Institutional advertising promotes an organization (versus a product or service) and typically is

used to announce a new corporate identity, to attract investors, to enhance an organization's reputation, or to reach out to local communities by promoting the sponsor as a good citizen engaged in social concerns, such as the environment.

Financial advertising is used by for-profit corporations to announce new financial developments. Securities underwriters routinely publish simple *tombstone ads* when new securities are offered for a client. These ads are published as a matter of public record and a form of reputation enhancement, not as an offer to sell or a solicitation to purchase securities (which requires receipt of a prospectus). Many firms try to attract and reinforce investor interest and to broaden their shareholder base through ads that tout their financial performance. Other financial ads are used in contested tender offers, where proponents or opponents of an acquisition urge shareholders to either sell or not sell their shares to the acquirer. Minority shareholders and activists also use advertising to sway shareholder votes in proxy fights or other actionable agenda items at corporate annual meetings.

Issues advertising enables an organization to speak on an important social problem, situation, or issue in which it has a stake. Advocacy advertising is being used with increased frequency as part of issues management programs to sway public opinion on social issues. In recent years, for example, there's been a sharp increase in commercials airing in Washington, D.C., devoted to pending legislation. These commercial spots target members of Congress and their staffs as well as government officials, lobbyists, and other political advocates. Issue ads also can be run as part of government relations programs: to influence voters in local ballot measures, referenda, and initiatives; and to reach congressmen, state legislators, and local officials when votes are pending on important legislation.

Political advertising is used to lend support to political candidates that a sponsoring organization supports (or to undermine or attack a candidate they oppose). Such independent expenditures are permissible on an unchecked basis following the U.S. Supreme Court's 2010 decision in *Citizens United v. Federal Election Commission* (558 U.S. 310).

Crisis advertising involves the use of print ads or broadcast commercials to inform people about how an organization is responding to an adverse situation—such as a natural disaster, strike, or other event that disrupts service or relationships.

Events advertising is intended to promote public attendance or participation in special activities that organizations want to promote. Not-for-profit organizations (sometimes funded by their for-profit partners) use paid ads to create participation in and public support for upcoming fundraising activities.

Not-for-profit organizations use *public service advertising* to promote social causes and ideals (also referred to as *social marketing*). Public service announcements (PSAs) take the form of print ads or broadcast commercials in the noneditorial portions of public media as well as messages that appear in out-of-home media (billboards, transit ads, etc.). Media organizations donate the space or time as a public service—to endear themselves to audiences and to demonstrate social responsibility to their regulators.

Public relations advertising differs from traditional product or service advertising by its focus on promoting an organization's image or advocating a position on a particular topic. However, fully separating product/service promotions from organizational goals is often difficult. Many product advertising campaigns, for example, seek to enhance the organization's reputation while also selling products. Similarly, some public relations firms provide product advertising and related promotional services as part of an integrated marketing communications program.

Advertising Messages

Effective advertising messages focus on a single topic and include a clear call for action. When developing ads, sponsors confront several basic creative decisions. The most important of these is to develop a "big idea" or creative concept around which the message is constructed. Sponsors must choose how direct they wish to be. A *direct* message strategy uses hard-hitting language and images that leave little doubt about an ad's purpose; *indirect* strategies are more subtle so that the intent is less obvious.

Another major creative decision involves whether to use *rational* or *emotional* appeals. An appeal using rational advertising relies on logic and argument strength and uses facts, figures, and illustrations. Rational ads can be particularly effective with audiences that possess the ability and motivation to process complex arguments. Emotional advertising appeals to the heart (versus the head) and tugs at people's affective responses by

relying on illustrations, anecdotes, and related devices. Emotional appeals often draw the interest of people with little previous involvement in a topic.

Ads also can be structured as lectures or dramas. In a *lecture*, a speaker addresses the audience using a first-, second-, or third-person narrative. In a *drama* format, the audience eavesdrops on a scenario involving others and participates vicariously. Dramas provide lessons that are to be inferred by the audience and reinforced explicitly in the ad's closing.

Advertising Formats

Print advertising follows generally accepted conventions but can vary considerably in terms of design (layout, typography, color scheme, etc.). Print ads use a large headline or strong graphic device to attract attention. Headlines telegraph the key message to audiences and are sometimes followed by *overlines* (secondary headlines that appear above the main text). The ad's body copy then presents explanatory or supporting arguments. Most ads end with a strong call to action and a signature element identifying the message's sponsor. Advertising slogans and organizational logotypes serve as continuity devices between messages. Legally required (known as mandatory) disclosures and other pieces of information generally are included in fine print at the bottom of the ad.

Print ads are most useful when a complex or detailed argument needs to be presented or when a response is desired through the use of coupons or forms. Newspapers and magazines usually sell ads in standard-sized formats. Most public relations advertising in newspapers strive for page dominance by using standard advertising units (SAUs) that are at least one-quarter of a page in size, preferably larger. In magazines, half- and full-page ads are the most frequently used formats. Other formats include *double-truck* ads (a two-page spread), multiple-page series, and inserts. Smaller formats can be used in both newspapers and magazines but often fail to generate sufficient attention. Generally, smaller ads are also less efficient because they cost more on a per-inch basis.

Broadcast advertising includes radio and television commercials. Broadcast messages must be especially cogent, draw people into the message quickly, restate key points several times, involve the audience,

and describe the actions to be taken. Broadcast advertising uses a variety of devices to attract attention—sound, music, a familiar voice, or (in television) strong visuals. All of these elements play a critical role and must be used imaginatively and integratively to create a persuasive message that can be told in 10, 15, 30, or 60 seconds—the typical lengths of broadcast commercials. On radio, critical points must be repeated orally; on television, text can be added to emphasize key points (such as a toll-free telephone number to call). Text can be superimposed over video and frequently takes the form of a billboard or a closing title (signature) of a TV commercial.

Web and mobile advertising is becoming increasingly popular. Various types of ads can be purchased on sites operated by third parties (search engine sites, media sites, and many special topic sites that arrange to receive commissions from advertising networks, such as Google, Yahoo!, and MSN). Ads that are all text are primarily intended to drive traffic to websites through prominently featured hyperlinks. Display ads, in the form of horizontal banners, sidebars, *interstitials* (these are inserts between webpages by either the ad network or the website itself, as a user moves from page to page), videos, and various specialty formats often aim to generate favorable brand impressions through incidental exposure, whether or not the user actually clicks through a website where additional details are provided. Click-through rates on websites generally are low (1%–3% of website visit) but can be effective and efficient for some advertisers.

Advertising Media Planning

Much public relations advertising involves purchasing time and space on a one-time or very limited basis. In such cases, the appropriate media outlets—such as a particular local newspaper or a handful of trade/financial publications—are quickly identifiable. However, when advertising is used to sway public opinion over time or in more than a single media market, advertisers need to follow basic media planning principles (the same ones used by product advertisers) to maximize their impact and avoid wasting advertising dollars.

The focal concept in media planning is the *impression*—the opportunity for one person to be

exposed to one of a sponsor's messages. Cumulative exposures are calculated as *gross impressions* by adding together the total impressions created in any particular media buy. The number of exposures created can be expressed in actual numbers of impressions or, more commonly, as ratings. A *rating point* represents 1% of the total potential audience for a message. A particular vehicle's *rating* is the percentage of total audience reached by that newspaper, magazine, radio, or TV show.

Gross rating points (GPRs) are the total percentages reached over a particular time frame when two or more messages appear in combination, whether in the same or in different advertising vehicles or media. The calculation of gross rating points provides a metric for ascertaining the cumulative total number of unduplicated impressions in an advertising effort. Generally, advertisers strive to generate the highest number of possible GRPs that a budget will allow (while avoiding overspending).

Generally, advertisers seek to maximize a campaign's *reach*, the number of distinct individuals exposed to a message at least once (eliminating duplication). Advertisers want to optimize *frequency* or create multiple opportunities for an audience to be exposed to a message. More than one exposure to a message is usually necessary for people to pay attention and to understand the ad's message, but excessive exposure can waste dollars because no additional persuasion effect occurs. Excessive exposure can also annoy audiences so that they disregard or respond negatively to a message. Thus, frequency involves balancing the need for *wear-in* (recall, comprehension) of a message while avoiding wear-out.

Advertisers generally want to gain maximum *effectiveness* by spending the fewest total dollars possible in a campaign. In choosing media, advertisers strive for optimal *efficiency* by selecting media that deliver the largest audience (on either a duplicated or nonduplicated basis) for the same dollars. An important consideration is timing. Some campaigns rely on *continuous* exposure, for example repeating the message in steady increments over a period of days, weeks, or months. However, in many instances by staggering exposure, advertisers can create or maintain *share-of-mind* awareness among audiences. Total expenditures can be stretched by alternating between periods of high

and low levels of exposure (*pulsing*) or between periods of nonexposure and exposure during key time blocks (*flighting*). Because of the high costs of advertising, many public relations advertisements are purposely timed to appear in a specific time period, such as the days before an event, election, holiday, or critical legislative vote. With a few exceptions, such as evergreen public service campaigns, most public relations advertising uses flighting schedules to optimize exposure and minimize costs. The absence of ads during periods of low or no exposure is offset in part by advertising's *carry-over effect*, the period during which people remember a sponsor's name or message.

Cost per thousand (CPM) is the shorthand index used to compare the cost efficiency of two or more media. CPM is computed by dividing the total expenditure for an ad in a particular vehicle by the number of people in the audience and multiplying the result by 1,000. This results in a dollars-and-cents figure that is easy to use and compare. When two media are considered, a \$3.50 CPM compares favorably with a \$4.25 CPM, suggesting that the first medium is more efficient, if it can be assumed that the quality of the audiences reached is the same. CPM rates of \$5 to \$10 are common in consumer media, but the cost per thousand can escalate in business-to-business and other situations where the audiences are small and the rates charged by media for advertising are comparatively high.

ADVERTISING EQUIVALENCY

Advertising equivalency involves calculating the value of public relations generated media coverage by determining what the air time/print space would have cost if the organization had had to pay advertising rates for it. For example, if a print medium charges \$200 per column inch for an advertisement, a five-column-inch story generated through public relations efforts would have an advertising equivalency of \$1,000. For broadcast media, if a 30-second spot costs \$10,000, then a 15-second news mention would be worth \$5,000.

Although many organizations use advertising equivalency in an attempt to assign a value to public relations efforts, this practice is fraught with problems. For example, historically most newspapers didn't sell ad space on the front page of a business section, the section where strong public relations efforts often appeared. Therefore, for equivalency purposes comparing such a placement to an advertisement was thus an apples-to-oranges situation. There was no true basis for calculating the cost of the space. However, the rise of digital media and the increasing financial pressures on print media mean that ads now appear where they never did before. When someone reads a newspaper online, and many people do, pop-up ads are ubiquitous. Thus, the long-standing flaw in advertising equivalency isn't as clear as it used to be.

A second issue is the public's difference in credibility when comparing an advertisement and an objective third-party story. The majority of the

public today has enough media savvy to understand that ads are controlled in both content and placement by the organizations that paid for them; this naturally engenders a legitimate skepticism about the veracity and motivation behind paid ads. A news or feature story, however, has the credibility boost of being produced by an independent, third party. Although there have been notable media honesty scandals, for the most part people still seem to trust mainstream media sources. Generating a placement in such a source has inherently more credibility than a paid advertising placement. A multiplier is sometimes applied to the advertising rate to compensate for this difference. However, the question then becomes, what is the appropriate multiplier? How much more credible is a story written by a business reporter and placed on the front business page than an ad found on the third page of this same section produced by a company? Given these factors, an attempt to demonstrate the value of public relations efforts through the use of advertising equivalencies can produce more skepticism than it alleviates with an analytical manager or client.

Clearly, the need exists for an adequate and appropriate manner and format to value public relations efforts. Although still used, advertising equivalency has flaws. The inherent differences between advertisements and independent coverage make advertising equivalencies too imprecise to reflect the value and credibility of public relations efforts. If asked to provide such a figure, a practitioner should explain to the client or manager the limits of this method.

ADVOCACY

Advocacy, the polar opposite of accommodation, plays a central role in public relations. An advocate works in support of a cause; therefore, public relations practitioners are advocates for

their organization or client. But, advocacy in public relations is controversial.

Extensive scholarship in public relations and mass communication argues that advocacy is persuasion and persuasion is asymmetrical communication and inherently unethical. Another school of thought suggests that advocacy is the essence of public relations and that persuasion does not have to be unethical. The trend in public relations favors the notion that, as Kathy Fitzpatrick and Carolyn Bronstein (2006) termed it, “responsible advocacy” is at the heart of public relations practice.

Engaging the essence of this theme, Ruth Edgett (2002) reported that advocacy is a key aspect of public relations, but public relations practitioners are often uncomfortable with this advocate role because the journalism and mass communication tradition in the literature and education of public relations touts the “moral superiority” of objectivity over advocacy/persuasion. This notion is based on the fact that most public relations educational programs are situated in journalism and communication schools, and, in that arena the objectivity of journalism—telling all sides of a story—is lionized. Advocacy, by its nature, is not objective. But that does not diminish its value. Edgett argued that rhetoric, “the art of persuasive communication,” is essential to debate in a free society and has been considered so for millennia. Edgett noted that the “giants” of public relations, including Edward Bernays, all stated unequivocally that their role as public relations professionals was to influence behavior as advocates for their organizations or clients.

The elusive definition of public relations contributes to the debate about advocacy. The Public Relations Society of America (PRSA) defines public relations as “a strategic communication process that builds mutually beneficial relationships between organizations and their publics.” While this definition notes the importance of mutual benefit, the organization also cites the importance of advocacy. In its statement of professional values, PRSA notes one of the roles of public relations professionals: “We serve the public interest by acting as responsible advocates for those we represent. We provide a voice in the marketplace of ideas, facts, and viewpoints to aid informed public debate.” In fact, the society itself serves to advocate for the public relations profession.

The key to ethical advocacy is that its goal should be to inform public debate in a truthful manner.

Advocacy is not necessarily monologic, although as noted above that is a criticism put forth by some. In fact, advocacy is likely most effective in a *dialogic* environment. Applying the logic long discussed in rhetorical theory, Robert L. Heath (2007) in writing "Management Through Advocacy," noted that "dialogue transpires in ways in which both parties can learn from one another and consider the strengths of each other's arguments as well as the weaknesses of their own" (p. 60). In short, advocacy is improved in a dialogic environment.

Practitioners seem to support the notion of advocacy as central to their role. Bruce K. Berger and Bryan H. Reber asked more than 700 public relations practitioners what it meant to "do the right thing" in public relations, particularly when an organization was moving in a questionable direction. Most of the practitioners said they would use professional advocacy to mitigate the situation. Their qualitative research identified seven categories of advocacy: loyalty advocacy, self-protective advocacy, rational advocacy, stakeholder advocacy, ethical advocacy, activist advocacy, and exit advocacy. The range of advocacy behavior they identified ran from advocating once for a position and subsequently following the decision of management regardless of its appropriateness, to leaving an organization when advocacy fails to change the direction of the organization. The authors concluded that according to their 700-plus practitioner respondents, "advocacy is the 'right thing.'"

When practiced ethically and effectively, advocacy serves multiple purposes: benefits the practitioner and helps him or her build a reputation for success, benefits the organization as the advocate is able to move its agenda forward, and benefits the public or stakeholder group as it becomes more informed about a product, service, or idea and is able to weigh the pros and cons of the advocate's argument.

AFRICA, PRACTICE OF PUBLIC RELATIONS IN

The future of public relations and strategic communication in Africa is daunting; however, slow and steady progress by leading nations is showing promise and shining a guiding light for other countries on the continent. Africa is a continent with many disparities, but because communication professionals are innovative and capable of drawing on global influence, the prospect for public relations leadership in Africa is promising.

Africa as Context

Africa, inhabited by 1 billion people, is the world's second largest and second most populous continent after Asia; it comprises a diverse and complex patchwork of 54 countries. These countries range from the large, prosperous, and cosmopolitan to the impoverished and troubled (Mersham & Skinner, 2009, p. 265). It is by far the world's poorest inhabited continent with an estimated 2.3% of the world gross domestic product (GDP). As the following GDP 2010 figures (billion USD) reveal, by this measure, contrasts within the continent are extreme:

South Africa	\$357.2 billion
Egypt	\$218.4 billion
Nigeria	\$216.8 billion
Algeria	\$143.5 billion
Angola	\$85.3 billion
Ghana	\$32.1 billion
Kenya	\$31.1 billion
Tanzania	\$22.6 billion
Zambia	\$16.1 billion
Botswana	\$14.0 billion
Congo	\$11.5 billion
Zimbabwe	\$7.4 billion

Source: World Bank International Monetary Fund Historical Gross Domestic Product (GDP) at Purchasing Power Parity (PPP), April 2011.

Note: Representative sample of 54 countries.

The contrasts between the highest and the lowest performing economies are striking. For example, South Africa has the highest GDP in Africa, with \$357.2 billion, whereas its neighbor Zimbabwe, with \$7.4 billion, is one of the poorest and most divided countries on the continent. Egypt, with \$218.4 billion, has the second largest economy in the Arab world, behind Saudi Arabia, according to the World Bank. However, it is important to note here that Egypt's GDP could be affected by political and economic uncertainty following the "Arab Spring movement," which began in December 2010, and has continued to 2013 with the drafting of a new constitution. Other similar political developments in Tunisia, with \$22.8 billion, and Libya, with \$160.2 billion, could also possibly affect their development and future growth.

Nigeria, with \$216.8 billion, has the largest market (population-wise as well as GDP) in Africa and is one of the fastest growing economies in the world (over 7% a year). Factors resulting from the Arab Spring could well catapult it into the number-two position in Africa. Nigeria plans to be the leading economy in Africa by 2020. Contrast this with its neighboring countries, Côte d'Ivoire, \$22.8 billion, and Niger, \$5.5 billion, whose economies are struggling as a result of recent civil wars. Given this diversity, imagine the variables in public

relations practices and communications that both challenge as well as serve as the foundation for the future in key areas of Africa.

Communication Infrastructure

To operate, communication managers need access to an efficient, diverse, and modern communication infrastructure. Specifically, in the context of new media, huge variations are found throughout the continent. The number of cellular telephone subscribers per 100 inhabitants and the level of Internet access are illustrative of this:

Fixed telephone lines	12 million	1.4 per 100 inhabitants
Fixed (wired) broadband subscriptions	1 million	0.2 per 100 inhabitants
Mobile cellular subscriptions	433 million	53 per 100 inhabitants
Active mobile broadband subscriptions	31 million	3.8 per 100 inhabitants
Internet users	105 million	12.8 per 100 inhabitants
Households with Internet access	n/a	5.7 per 100 inhabitants (estimated)

Source: International Telecommunications Union (ITU).

Currently, although not universally so, there remain daunting challenges to public relations practitioners when dealing with Africa: The scarcity of information and communication technology infrastructure, the high cost of international bandwidth, the dearth of relevant local content combined with the lack of cooperation among development partners, and the political instability in many parts of the continent.

Media in Africa

Media channels exist that serve some countries in the African landmass, such as the BBC World Service, Voice of America, Channel Africa satellite television originating from the South African

Broadcasting Corporation (SABC) as well as Multi-Choice Africa (MCA). The Nigerian Television Authority International is visible in its international broadcasting through its various cable platforms. However, as practical paths for public relations and corporate communication managers, these channels have limited value: first, in trying to be broadly “African,” they lose much of the localism and relevance on which editorial communications depend; and second, they are essentially limited to particular publics: English-speaking, relatively literate and affluent audiences (Mersham & Skinner, 2009).

In addition, French is widely spoken in many parts of Africa (West and Central) as is Arabic in North Africa. Such diversity suggests that the successful application of multilingual, multicultural media policies is required to meet the requirements of the diverse audiences throughout the continent. So, the need to plan and manage communications at a local level or country by country is essential.

To illustrate this diversity, Kenya currently enjoys 37 TV stations, 161 FM radio stations, 16 newspapers, and 71 consumer magazines, together with a number of trade technical and professional journals and directories. However, Tanzania leads the rest of East Africa with more than 55 newspapers, 63 TV stations, 184 FM stations, and 73 magazines. Social media and mobile marketing are having a huge impact on the way individuals are communicating (Skinner et al., 2012).

In North Africa, Egypt has a mix of state-run and private broadcast media. State-run TV operates two national and six regional terrestrial networks as well as a few satellite channels. About 20 private satellite channels and a large number of Arabic satellite channels are available via subscription. State-run radio operates about 70 stations belonging to 8 networks. Only two privately owned radio stations are operational. In 2010, the country had 200,000 Internet hosts and more than 20 million Internet users.

In West Africa, Ghana has seven TV stations, one state owned and six private. There are over 120 private radio stations, one state-owned, while 12 are community-owned. The Ghana Journalists Association has more than 40 registered newspaper houses; 2 of these are state-owned.

As early as 1959, Nigeria was the first country in Africa to have TV and radio stations. All 36 states operate TV stations and there are now some 70 federal government-controlled national and

regional stations. There are a number of private TV stations in major cities, for example in Lagos and Abuja. There is a similar network of state-operated radio stations typically carrying their own programs, except for news broadcasts. In all, there are more than 120 public and private radio stations operating throughout Nigeria. Similarly, there is also a great diversity of newspapers and magazines, so media plurality is indeed high involving the state, private owners, and communities (Skinner et al., 2012).

The SABC operates four TV stations: Three are free-to-air and one is for-pay TV; eTV, a private station, is accessible to more than half the population. Multiple subscription TV services provide a mix of local and international channels. South Africa enjoys a well-developed blend of public and private radio stations at the national, regional, and local levels. The state-owned SABC radio network operates 18 stations, one for each of the 11 official languages, four community stations, and three commercial stations. There are more than 100 community-based stations that extend coverage to rural areas. As of 2010, South Africa had 4,835,000 Internet hosts and more than 5 million Internet users.

Public Relations Practice

Public relations has been operating successfully for over 50 years in Africa, with more than 12,000 members in the various professional bodies around the continent (Skinner et al., 2012). South Africa is a relatively mature market, with a long tradition of public relations education, professional development for practitioners, and large corporations with international outreach. In 2010, it became the first African nation to host the Fédération Internationale de Football Association (FIFA) World Cup, which required an extensive international public relations and marketing plan.

Nigeria, the most populous nation in Africa, has made rapid strides in developing its public relations industry. The Nigerian Institute of Public Relations (NIPR) attained the status of a Chartered Institute in June 1990 through Decree No. 16, now an Act of the Federal Republic of Nigeria. It is the only country in Africa to hold this status. In turn, this has allowed the NIPR to regulate the practice of the profession, monitor professional conduct through a Code of Ethics as well as set and monitor academic

and professional qualifications for admission to the Institute and the profession. It currently has over 10,000 members in 36 state chapters and a city chapter in Abuja. In West Africa, the evolution of the Ghana Public Relations Institute reflects the newfound economic prosperity of this country brought about by recent oil discoveries.

In 2011, the Public Relations Society of Kenya (PRSK) celebrated 40 years; it has a relatively well-developed public relations industry primarily because of its tourism industry. Like Nigeria, the PRSK is in the process of securing legal accreditation. In other parts of East Africa, the Public Relations Association of Uganda (PRAU) was established in 1976, the Tanzania PR Institute in 1999, and the PR Association in Rwanda in 2008. Even Gambia, the smallest state in Africa, has a Public Relations Institute. However, in terms of public relations as an occupation, generally most nations in Africa are still somewhat undeveloped.

Linking all of these individual associations in Africa is an umbrella organization called the African Public Relations Association (APRA). It is the successor organization to the Federation of African Public Relations Associations (FAPRA), which was inaugurated in Nairobi, Kenya, in 1975. Thirteen member organizations as well as individual members and corporate clients/corporations now form part of the association. Its secretariat is based in Nigeria. One of the key challenges that the association faces is to strengthen its institutional links with such bodies as the African Union (AU), New Partnership for Africa's Development (NEPAD), and other subregional organizations. Improving this network will give APRA more credibility and access to leading figures in the political and economic arena, while at the same time assuring a presence as part of a wider movement within the continent of promoting a new image of growth and stability under the banner of the "African Renaissance."

Education and Training

Throughout the continent, there are wide educational variations in professional or vocational teaching and training institutions dedicated to public relations and strategic communication. In many cases, mass communication and journalism programs continue to be the flagship offerings (as it

was some thirty years ago in developed countries). In Kenya, there are as many as six universities and several colleges offering degree courses in public relations and strategic communication. Uganda and Tanzania have three each; South Africa has more than 20.

Nigeria now has 65 poly- and monotechnic universities, teaching communications and public relations and offering bachelor, masters and PhD degrees. NIPR conducts its own professional examinations for practitioners as well as offering a Master of Science in Public Relations (MSc) through the University of Nigeria.

The Future of Public Relations in Africa

The increasing growth of political democratic institutions coupled with the adoption of mixed and market economies across Africa have combined to reshape the attitude of government and the public and private sector toward public relations activities. While a few governments see public relations as a propagandist tool, quite a number of public and private sector businesses are considering effective public relations as essential for spreading their message across a terrain occupied by a multiplicity of media.

However, the individual economies of the countries in Africa and their continued viability have been hugely impacted by the world financial crisis of 2008–2009 and the subsequent economic, social, and political meltdowns that continue in key markets that the continent both trades with and receives investments from. The threatened demise of the euro market is particularly worrisome as 40% of the trade from Africa and much of its tourism revenue originates from this region. Fortunately for the continent, Chinese interests and their promised new investment of \$20 billion in the next 5 years has to some extent replaced the declining American and European investments and trade.

The alliance of BRICS (Brazil, Russia, India, China, and South Africa) states could bring about new opportunities for public relations in this changing political, social, and cultural landscape. African practitioners, already at the cutting edge of social change, are well placed to take advantage of these new challenges and opportunities.

AGE OF DEFERENCE, END OF THE

During the 1960s, the United States experienced the end of the age of deference. The point when deference ended is not clearly marked in the sands of time, but it resulted from a reduced belief in the honesty and ethics (corporate social responsibility) of American business practices. Deference began to wane as people thought that the executive management leading private sector organizations no longer was a legitimate broker of the public interests.

In 1966, Gallup Poll surveys found that 55% of the public had a great deal of confidence in the management capability and ethical standards of American business executives. A decade later, the confidence level had fallen to 16% and continues to hover in that range today (Kelly, 1982). For over four decades, after those post–World War II highs, the polling companies found that company executives and other societal leaders have received very low honesty and ethics ratings from the public.

The Growth of Deference

American business leaders used many of the last decades of the 19th century to create a rationale supporting the concentration of capital as the preferred standard operating financial and business arrangement. During the early years of the 20th century, corporate size equated to productivity in this business arrangement. This premise also added to the tug-of-war that occurred among executives, media reporters, labor leaders, consumer advocates, civil rights advocates, and government leaders to determine whether those trends led to benefits for all or only to the barons of industry. The Great Depression dampened this corporate effort to achieve deference within these disparate groups. Then, during World War II, American industry contributed to democracy, prosperity, and the dream of a new lifestyle. Public relations practitioners helped effectively position companies during these years of the 20th century, resulting in a deference that was earned and granted by the public through statements and deeds.

People in the United States were looking for a morale rebound after the despair of the Great Depression. World War II gave a substantial boost to the collective feeling of well-being and goodwill. Industry had excelled in its ability to innovate, invent, and manufacture materials. A new lifestyle was created by the abundance of goods and materials, research and development achievements, and the country's manufacturing capacity created during the war.

Women and minorities had gone to work in large numbers. The GI Bill trained men and women for new occupations that changed their lives and the national lifestyle. The nation felt that its role in the war had been righteous. Words such as *freedom* and *democracy* became the hallmarks of the age—signaling the challenges needed to be addressed to reconcile business practices and government policy—and the policy preferences of activists. Public policy planning had become joined to strategic business planning.

Challenges to Deference

The civil rights movement was one of many issues that focused on the disparity between claims of a new country dedicated to freedom and democracy and public perceptions or actions to the contrary.

In marked contrast to those values were myriad institutional and cultural barriers against people of color. Thus, the civil rights movement began to scrutinize every aspect of American business and government looking for gaps between promise and delivery. Many gaps were found, and substantial opposition arose to efforts to close these gaps. The 1950s and 1960s witnessed an era when civil rights leaders examined the ability of government and business to deliver on promises.

Without a doubt, the civil rights movement created a foundation for the dozens of activist movements that occurred over the latter half of the century. The antiwar efforts examined the rationale and strategic military choices made in Vietnam. Deference toward the office of the president of the United States hit a low when college students and other antiwar activists chanted, “Hell no, we won’t go” and “Hey, hey, LBJ, how many kids did you kill today?”

After having worked successfully to create and then restore confidence in large business practices, many executives and senior public relations practitioners were caught off guard by the growing hostility and doubt that characterized public sentiment in the last half of the 20th century. Faith in the American dream of capitalistic concentration had faded; many people came to believe that the free enterprise system that had produced the most envied lifestyle in the world also resulted in myriad problems.

During the last 3 decades of the 20th century, regulation and legislation were enacted to constrain corporate actions that previously had been acceptable to earlier generations of citizens. Activists from all points of view converged on the federal and state capitols with a list of grievances about corporate behavior. Because of their doubt that Congress and city governments would constrain corporate actions, they became prone to sue government to force it to create and implement regulatory and legislative change.

This outburst signaled that the era of deference had ended. The ringing call for “power to the people” shouted by civil rights activists had become the soul of American politics. Executives were offended by accusations that they were destroying human rights, consumer interests, and the environment.

Businesses and government agencies were caught off guard by this sudden and profound

change. Their initial reactions in the late 1960s and 1970s were to dismiss the critics and denigrate their motives; reactivity was the spirit of the day on the part of corporate and governmental leaders.

Eventually, more proactive measures were innovated and implemented. One of the innovations was the creation of issues management as a strategic response discipline and a corporate program. This move followed a similar initiative that included the creation of the concept and practice of *public affairs*, a term coined by larger companies to reshape the public relations discipline to make it more responsive to government relations. The traditional approach to public relations, these innovators believed, had been slanted toward publicity responses and reputation management rather than the public debate of the merits of various issues of fact, value, and policy. Legislatures became the battlegrounds for dealing with complex issues related to every aspect of society. Topics ranged from civil and human rights to environmental quality and product safety. Governments responded by creating new government agencies, such as the Environmental Protection Agency and the Occupational Safety and Health Administration. Regulatory powers and budgets grew rapidly as government was given new charges to protect the public interest.

Corporate responsibility received considerable attention and took on new meaning during this era. First calls asked for responsiveness—businesses must be sensitive and responsive to the interests of their stakeholders. This discussion elevated to the demand for responsibility. A new sense of corporate responsibility carried organizations into thinking in terms beyond merely paying salaries and taxes, providing goods and services, and sponsoring visible philanthropy.

Calls came for organizations to achieve ever higher moral standards, focusing broadly on considerations of fairness, equality, safety, and environmental quality. Executives and their counselors could not simply defend themselves by pointing to the goods and services provided and the incurred costs of change. Defenders of corporate policy learned that some methods of response were clearly outdated, such as responses by electricity generators that the critics could just freeze to death in the dark. Public hearings at all levels of government criticized the fundamental principles and rationale of the private

sector. Such changes in public policy battles justified new approaches to governmental relations.

Two changes occurred that strained or ruptured the relationships between organizations and citizens. One was the failure on the part of business to recognize that the values of American society had changed. Progress was no longer the single rationale for business activities based on executives' preferences. The quality of goods and services was engineered to the point where planned obsolescence prompted a high level of consumer dissatisfaction. The American automobile industry, for instance, was so focused on style and cost reduction that it failed to realize that consumers were more concerned with safety and quality. Imported automobiles set a high standard on both counts. The slogan "Buy American" now rang hollow because that meant going along with American businesses for their sake rather than for the interests of their customers.

The other dramatic change resulted from the creation of new standards of operation and environmental excellence. Slowly, various publics had developed a higher sense of value on all aspects of corporate operation. People were offended by discrimination in hiring and promotion of women and people of color. They came to criticize many business practices as being unfair. They looked at the environment and accused and indicted various industries for health and aesthetics violations. The right of wild animals to a natural habitat came to take precedence over corporate desires and plans to harvest timber in the most cost-effective manner.

Once the demise of the age of deference began, the role of the public relations practitioner changed and smart companies realized that many new functions were needed. An old, and now outdated, sense of public relations and reputation management argued that reporters could say anything they wanted about businesses as long as they spelled the names correctly. This approach to public relations held that favorable publicity could combat unfavorable publicity. Advertising dollars were assumed to mute or soften media criticism. Industry held an elite status with the media. Neither could exist without the other; criticism could only go so far, or it would kill the goose that was laying the golden eggs. This tension has not stopped, but more and more practitioners are now in a counseling position to caution managements that if they like that planning decision, they should be happy to see it

on the front page of the newspaper or at the top of the hour on radio or television news.

Once caveat emptor—buyer beware—was the standard byline for the business community. Industry softened this harsh reality by using their earned deference to say, "Trust us." Thus, people were responsible for the safe use of automobiles, which were built to safety standards preferred by Detroit executives. If consumers hurt themselves or were hurt, they were responsible for their injuries. The bias in understanding and attributing responsibility favored industry. Today, the equation has reversed. People are not responsible for any misuse of a product because they can and do argue that they were not properly warned of the hazards in using the product.

Trust is basic to the business transaction—the relationship between vendor and customer (e.g., product safety) and between vendor and citizen (e.g., trade policies, shifting jobs to a foreign country, or creating sweatshop conditions outside the United States). After having worked hard to build trust and demonstrate that it had earned the public's trust, American industry failed to maintain the level of deference it had earned.

A New Deference for the Future?

This battleground is far from settled, especially through the crafting of new and conflicting zones of meaning. The new corporativism that is operating in business and becoming central to political campaigns is seeking again to lead citizens and consumers to distrust any sense of politics that challenges the prerogatives of business executives. Risk-reward ratios are turning topsy-turvy. Banks that are too large to fail reap rewards from what they do and shift the burden of failure onto customers and taxpayers. New political dynamics argue that individualism, including the personhood of businesses, is now the standard of liberty, especially as interpreted by the Supreme Court in *Citizens United*. Workers are on their own to compete against foreign labor; cheap products are the standard, as are low corporate taxes.

Once freed from the shackles of government restraint, so the advocates claim, business will again burst forward into a new age of deference—to them.

AGENDA-SETTING THEORY

During the first 50 years of the 20th century, the focus of social science and the new field of mass media research on the social and psychological effects of new, widespread media technologies and vehicles dominated communication theory and research. In mid-century, however, University of North Carolina researcher Maxwell McCombs and his partner Donald Shaw returned to an earlier theme that focused on the power and effects of media itself. Their three presidential election studies explored the relationship between media presentations of news and the resulting importance that recipients of that news assigned to it. Thus was born the theory of *agenda setting*, which McCombs continued to study for the next four decades. This theory advances the theme that reporters serve as gatekeepers to filter news events and by, their reporting, set an agenda. The agenda results from the kind and amount of attention that are given to news events, especially in the context

of elections, where candidates chase news to keep their views before the voters.

The original agenda-setting proposition was a direct reflection of the 1920s public opinion scholar Walter Lippman's statement that the press formed "pictures in our heads" (Lowery & DeFleur, 1995, p. 266). McCombs and Shaw tested that idea in an exploratory study of the 1968 presidential election coverage in Chapel Hill, North Carolina. What they discovered was a high correlation between what the news media reported as issues and what voters identified as issues. Their findings helped clarify the definition of agenda setting—focusing on the cognitive (awareness) level rather than the affective (feeling) level; in other words, media make voters aware of the issues but do not tell them how to think or feel about the issues. Also identified were suggestions about media's limitations in the process, specifically the impossible task for media outlets of covering all issues. These findings refocused attention on the media as a powerful force in its own right rather than just another variable in the viewers' social and psychological processes.

McCombs and Shaw then used the 1972 presidential election to conduct a more comprehensive study of agenda setting in Charlotte, North Carolina. They expanded the scope of the 1968 study to include voters' information from other people as well as from the media, voters' own personal characteristics, the influence of time on setting agendas, and the role of politics in agenda setting. This study confirmed the general hypothesis from the 1968 study about creating awareness and led them to concentrate on awareness and information as critical stages in opinion formation. It also reconfirmed media limitations in covering all events and issues and clarified how these limitations influenced the complex process of how and why media make decisions to cover or not cover certain issues.

Next came the study of the entire 1976 presidential election year in three communities: Indianapolis, Indiana; Evanston, Illinois; and Lebanon, New Hampshire. This study revealed more contributing factors: (1) newspapers and television influence voters more in the early campaign stages; (2) voters did seem to rank the importance of issues in the same sequence as the media did; and (3) voters with personal characteristics, such as

higher educational levels, more political knowledge, and more interest in political matters were more inclined to use media on a regular basis, making them more likely to be influenced by the media.

These three studies spawned more than 200 studies exploring agenda setting during the next 25 years. Significant studies include the following:

- Doris Graber's 1980 study looked specifically at the strength of the media's influence on voters' judgments; she found that the influence varied depending on environmental circumstances as well as media content.
- Dominic Larsorsa and Wayne Wanta's 1990 study added interpersonal experience to the agenda-setting paradigm of newspaper and television news on issues' importance.
- Scott Hays and Henry Glick's 1997 study extended the agenda-setting idea from its news effects to policy adoption effects and concluded that when environmental conditions in the political entity (the state) and media influences are similar and convincing, "the policy in question is more likely to be adopted" (p. 511).

McCombs then expanded his study to the international arena, studying the 1996 general election in Pamplona, Spain; the 1994 Taipei mayoral election; and the 1993 Japanese general election. He concluded that the idea of what the media presents to voters as issues holds across cultural differences.

McCombs identified two levels of agenda setting: a level that embodies the original concept that media tells voters what to think about, and a second level that adds the idea that media select attributes to cover and exclude others, which creates a way of thinking about what is presented.

From his extensive research, McCombs further refined the roles of agenda setting in terms of how the news media builds consensus. He suggested that the media play four roles in agenda setting and thus must exhibit four traits to build informed communities:

1. The media should be professionally detached, reporting the facts and not determining the pros and cons of issues.
2. One of the functions of news media is to recognize their targeted involvement in putting issues on the agenda.

3. The media are the precursors of issues.
4. The long-term effect of media involvement in issues is the creation of a public agenda.

Criticisms of the agenda-setting focus range from the strength of the media influence to recognition of the effects of interviewing variables on voters' attitudes and behaviors. Everett Rogers and James Dearing identified three distinct agendas: media agendas, public priorities, and policy priorities. They contended that the three agendas interact at various times and to various degrees rather than assuming that the media agenda is always the dominant factor. Denis McQuail claimed that there is insufficient evidence to show a causal connection between different issue agendas, and that this perspective needs more long-term information on party platforms correlated with long-term public opinion panel data.

Sharon Lowery and Melvin DeFleur developed a list of concerns related to the agenda-setting concept, including the influence of different audience categories, the individual characteristics of voters, the role and influence of interpersonal communication on voters' opinions, differences in the importance of issues, and the effects of political candidate advertising in relation to news coverage.

Perhaps one of the greatest contributions of the agenda-setting hypothesis is the variety of related theories and perspectives it has spawned. The following studies can all trace their theoretical foundations to agenda setting.

Shanton Iyengar and Donald Kinder's 1987 work described media priming as "an extension of agenda setting (that) addresses the impact of news coverage on the weight assigned to specific issues" (McQuail, 2000, p. 456). They concluded, for example, that priming in news portrayals causes politicians to try to associate themselves with the issues they appear strongest on and disassociate or distance themselves from issues on which they appear weaker to create congruence with the perspectives that the media have presented.

Dearing and Rogers combined agenda setting with other media effects, theories, and concepts, such as bandwagon, spiral of silence, diffusion of news, and media gatekeeping, in an effort to include the social and psychological components of the social scientific approach to understanding the role and impact of media in society.

Nevertheless, framing theory is one of the most visible extensions of agenda-setting theory. Originally proposed by James Tankard, Laura Hendrickson, Jackie Silberman, Kriss Bliss, and Salma Ghanem in 1991, the concept holds that entities can create a media frame to convey a central idea in a chosen context; in other words, they can stage the idea and plan the format in advance. Robert Entman advanced the framing idea to include highlighting certain elements within the frame—in essence, including the most salient ideas to the targeted audience while excluding others.

These adaptations of agenda setting have moved the concept of media influence into the repertoires of other media practitioners, particularly in public relations and advertising, which rely on creating awareness as a condition for motivating behavior.

McCombs is still involved in exploring and refining the future of agenda setting. In a turn-of-the-century review of his work, he outlined two major directions he sees for agenda setting. First, agenda-setting research will continue to move from its journalistic roots to other areas, such as public relations and advertising: “Public issues are not the only objects that can be studied from the agenda-setting perspective” (McCombs, 1997, n.p.). Second, agenda-setting research will continue to study the relationships among factors influencing individuals’ decisions on how to vote and other issues.

In addition to McCombs’s defined directions, a third major direction should be considered: the international study of agenda-setting effects. McCombs’s own Spanish election research and other scholars’ work in different cultural and political settings provide yet another vast arena to explore and think about how media and people interact to decide what’s important.

AGGREGATOR NEWS SEARCH

An aggregator, or reader, is a website or software program that continuously searches multiple websites, including news sites, blogs, and podcasts, for new content. When fresh information is located, it is “aggregated” or summarized into one reader page. The aggregator program illustrates a summary of that material, providing a link to each webpage. This link prevents users from having to constantly visit favorite websites for new information. While there are dozens of aggregators, the most common in 2012 include BuzzFeed, Spokeo, TweetMeMe, Digg, FriendFeed, Google Reader, iGoogle, myYahoo!, Reddit, Stumbleupon, and Yelp. Of the several types of aggregators, the most widely used is a news aggregator that collects news from various news sites. These tools are used extensively by public relations practitioners for environmental scanning and monitoring and to gather information about specific organizations and topics. Examples include Google News, World News Network, Huffington Post, and the Drudge Report. Similarly, search aggregators gather results from multiple search engines based on specified topics selected by users, then filter and organize the information based on user parameters.

Aggregators are also called feed readers, news readers, and RSS readers. Perhaps the most widely known aggregate is RSS, or Really Simple Syndication, which allows users to automatically subscribe to content, such as blogs, news headlines, audio and video, through a single document or “feed.” Web syndication benefits the creator of news in that content is distributed automatically, quickly, and economically. It benefits users because the aggregation is free and requires only one step to

have information automatically delivered from a plethora of sources.

While aggregators are growing in popularity due to time-saving utility, they are not a new technology. The first known aggregator was OpenSearch, which is still used today; it was developed by Amazon.com in 2005 to enable users to easily read search engine results. It follows the format of popular feed services, such as RSS and Atom.

Social network aggregators fetch and deliver content from various social media networks, such as Facebook, Twitter, YouTube, and others. Examples of these aggregators include Bottlenose, Doozly, Hootsuite, Sociagg, TweetDeck, Postling, Social-TALK, and Alternion. Public relations practitioners, such as Nicole Van Scoten, a public relations specialist at Pyxl, use social network aggregators for reputation monitoring across social media sites.

With the growing popularity of YouTube and other video sites, literally millions of videos are placed on the Internet daily. Thus, an emerging trend is to use video aggregators that enable users to organize parts or whole segments of videos from Internet video sites. Popular video aggregators include Aggrega, The Daily Feed, Feedbeat, PikSpot, uVouch, VodPod, and WeShow.

Other types of aggregators include email aggregators that combine users' email accounts and can act as social networking platforms. Top email aggregators include Fuser, Goowy, Jubii, Orgoo, TopicR, and Zembe. Data aggregators search databases and compile data to sell to other organizations for marketing purposes. Poll aggregators search for and provide polling data, while review aggregators combine movie, product, or service reviews. Each of these aggregators makes gathering and distributing public relations materials more efficient to target audiences.

ALUMNI RELATIONS

Alumni are graduates of a particular school, college, or university. However, former students who did not graduate from a particular school, college, or university are also considered alumni of that institution. An alumna is a female graduate or former female student of a school, college, or university. The plural form of *alumna*, used to refer to more than one female graduate or former student, is *alumnae*. The singular form of *alumni* is *alumnus*. When referring to a male graduate or former male student, use *alumnus* as the singular form and *alumni* for the plural. According to the *American Heritage Book of English Usage*, coeducational institutions usually use *alumni* to refer to both male and female graduates and former students.

Professionals who focus on alumni relations not only build relationships with alumni, but they also nurture and maintain these relationships. Most institutions employ an entire department devoted to alumni relations, and many large institutions have separate organizations that exist to support alumni activities.

Although students who attend or graduate from a school, a college, or a university are automatically considered alumni of that particular institution, they are usually asked to pay dues to join an alumni organization or association. Alumni organizations exist to help sustain a particular institution, and public relations practitioners may be asked to help identify those alumni who are willing and able to give (not just financially) and to facilitate the ways in which alumni are recognized for their efforts. Often, alumni organizations or associations offer various levels of membership, with

increasing increments of membership dues. Many associations offer a lifetime membership to those alumni who are financially able and willing to support the organization at a higher level.

Public relations practitioners who work in the area of alumni relations are faced with the critical task of directing, implementing, and evaluating all communications with alumni. Equally challenging is the fact that alumni tend to be scattered across the globe. Keeping track of alumni who graduated more than 30 or 40 years ago is not easy, and part of the responsibility falls to the alumna or alumnus to provide the alumni organization with updated personal contact information. If alumni organizations offer services and benefits that appeal to alumni, then those alumni should *want* to keep their information current so that they can stay current on news about their former institutions and therefore be contacted about upcoming events, such as reunions and homecomings.

Another way to keep alumni connected who do not live close to the university is to form constituent groups of alumni who are based in other regions of the country or world. This enables alumni who live near one another to meet and hold events and still feel connected to the university and other alumni.

Research is essential to learn what alumni want and how to effectively maintain relationships with them. Surveys are an important and simple tool for alumni organizations and universities to gain an understanding of how their alumni view their respective institutions and how willing they are to support them, whether with time, money, or both.

Managing communications with alumni is an important responsibility of public relations practitioners. Alumni magazines published quarterly or alumni newsletters published monthly are essential to maintaining contact. Offering a section within these communications pieces for class updates and personal information encourages alumni to keep in touch with their former classmates. In the world of electronic communications, alumni websites provide easy ways for alumni to register and keep their contact information current, as well as allowing them to connect to their former institution on a daily basis. The job of the alumni organization is to build the bridge to make this possible.

Alumni recognition also is an important factor in maintaining healthy alumni relationships. Recognizing

all alumni achievements and support, instead of focusing only on those alumni in high positions, goes a long way in showing that the organization cares and takes a vested interest in each individual who attended and represents the institution.

ANALYTICS

Analytics refers generically to the systematic analysis of data as well as to the set of tools employed in that analysis. In public relations, analytics have become important tools in the evaluation of online public relations. Analytics are used in *progressive research* (monitoring online activity while a public relations initiative is under way) and *evaluative research* (determining the overall success at the conclusion of a campaign).

The Digital Analytics Association (formerly the Web Analytics Association) defines analytics as the “measurement, collection, analysis and reporting of internet data for purposes of understanding and optimizing [digital] usage.” As reflected by the organization’s name change in 2012, today analytics are applied to a wide range of digital media, including mobile communications and applications.

Analytics are rooted in the ability of these digital systems to track and report user actions in real time. Various firms track digital user usage, including mainstream media research firms, ad networks, and the specialized sites that monitor website, blog, and mobile app activity.

Google democratized analytics in 2005 by providing free information about activity on various websites to site operators and advertisers. Today, similar information is readily available from media sharing and social networking sites used in many public relations programs. Consultants can assist organizations in interpreting the mountain of information available from these various sources as well as data resulting from an organization's own digital activities.

Early analytics focused on website traffic and usage and employed embedded devices, such as logfiles, cookies, and page tagging. Today, information also can be culled whenever a visitor registers on a website, downloads an app, or provides information compiled in a database (such as when requesting information or making a purchase). In many jurisdictions, organizations have both an ethical and legal obligation to disclose how they intend to use the information they collect. This is particularly important if analytics are used to profile a user (techniques known as *predictive modeling* and *behavioral targeting*).

Analytics most commonly take the form of *counts* or *ratios* (computed by dividing one count by another count). Generally, the focus is on measuring a key business or communication success strategy—often called a *key performance indicator* (KPI).

The specific measures that are important vary by the type of content (website, blog, text or microblog messages, wiki, app, etc.) but generally focus on either breadth of exposure or depth of user engagement. Examples include the number of messages opened/viewed, visits/sessions, unique visitors/audience members exposed to message, and duration of time spent with the message. Other metrics trace the type and identity of a referring source. Here special emphasis is placed on the number of click-throughs from one source or message to another as well as click-through ratios.

Content engagement can include measures, such as the number of comments, corrections or updates, replies or favorable ratings, and/or messages saved, printed, or shared. Other measurements are exit page ratios, single-page visits, and bounce rates (visitors who depart with minimal engagement). Conversion ratios represent the percentage of visitors completing a targeted action, such as requesting information or ordering a product. Assuming

sufficient information is available, analytics also can calculate cost per transaction and return on investment (ROI).

ANNUAL REPORTS

An annual report is one of the main tools used in the investor relations profession. Investor relations professionals focus on educating investors about the true value of the company. As a result, one of the key activities of investor relations is an extensive disclosure on the variety of company involvements in order to enable shareholders to see the big picture of the company's value; these reports feature such topics as corporate structure, products produced, research and development efforts, financial results achieved, new management hires, and merger and acquisition plans.

Disclosure is conducted through individual meetings with investors, roadshows by company

executives to key financial centers, conference calls with investors and analysts, and the especially relevant production of an annual report.

There are two types of annual reports. One type is usually a glossy and upbeat publication that details the company's achievements over the last year. This type of report tends to have many pictures, bright colors, and text in plain English. Publishing of this type of annual report is at the discretion of the company's management; it is not required nor is the content regulated: typically, it starts with a letter to shareholders from the chief executive officer or from the chairperson of the board of directors (corporate speech), and then the content that follows can vary widely from company to company and from year to year.

The second type of annual report, known as Form 10-K, is one that the Securities and Exchange Commission (SEC) requires all publicly traded (and some private) companies to publish. This form must be submitted to the SEC within 60, 75, or 90 days after the end of the fiscal year, depending on the status of the company. After filing, the report is immediately available online through the Electronic Data Gathering, Analysis and Retrieval (EDGAR) system. Companies must also file Form 10-Q, a quarterly report, and Form 8-K, a current report about unexpected important events). Often written in codified legalese, the 10-K annual report is quite difficult to read and understand—it can be as long as hundreds of pages with many footnotes.

The content of 10-K annual reports is strictly regulated: each must consist of four parts and 15 schedules. Part 1 provides a general description of the company's business, including its history, its main markets, its risk factors, and a description of its assets and business processes. Part 2 largely focuses on financial results from the previous year—including financial results, management discussion and analysis of these results, explanation of accounting practices used to display these results, and a detailed explanation of the procedures used to collect the data and ensure its accuracy. Part 3 discusses the company's management team and each manager's compensation and security ownership. Part 4 includes a variety of exhibits and signatures.

The EDGAR system and the 10-K annual report format have been undergoing significant changes. In 2010, in order to make the 10-K more

user-friendly, easier to read and easier to retrieve information the SEC launched a process of changing the report format from text to XBRL, or eXtensible Business Reporting Language. Due to this XBRL conversion, the data in an annual report becomes machine readable and searchable. To achieve this, the annual report is populated with tags that label information in the report using machine code—the tags identify each piece of information in the report. Consistent use of standard tags allows a comparison of reports between different companies. XBRL is still in the early stages of adoption—only large companies are required to use it and many issues still exist with accuracy of the data-tagging process.

Another development that changes the traditional practice of annual report publishing is the *10-K wrap*. A 10-K wrap allows a company to save money by combining 10-K and the glossy annual report. Instead of producing two complete annual reports, the company simply prepares a few pages in color with a few pictures, a letter to shareholders, a brief summary of annual results, and the management interpretation of these results, and then places the required 10-K in the middle. Thus, these few glossy pages wrap around the 10-K, hence the name. Producing a 10-K wrap saves money for the company, yet it still allows the management to provide its opinion and commentary to shareholders on the results of the company's development in the past year. This makes a 10-K wrap a popular option with almost 50% of companies in the United States switching to this format.

According to the National Investor Relations Institute, the average budget for creating an annual report is about \$100,000. On average, a print run for a company's annual report is 60,000 copies. However, annual reports that are posted only online are becoming more and more common. Although the text of annual reports is usually prepared by the investor relations department in cooperation with the finance/treasury and legal departments, the overall design and photography are typically outsourced to specialty agencies.

ANTECEDENTS OF MODERN PUBLIC RELATIONS

Conventional wisdom marks the beginning of public relations as we know it today as occurring during the 19th century, in the United States. A confluence of growing mass media outlets, a desire to reach mass markets, and a need to create public policy support for large industrial complexes fostered the practice and motivated the pioneers of the field to refine and shape the practice to the conditions of their time. Promotional giants, such as P. T. Barnum, used the profession as a honed art, and industries like the railroads and electric utilities used the profession to gain acceptance for uniform operations.

However, it is important to note that although the growth of media outlets offered new challenges and opportunities during the 19th century, many of the functions of the practice were well established by this time. Although working in the 19th century, the pioneers of the practice built on a foundation that arguably reaches back to the dawn of civilizations that are hundreds and even thousands of years old. For instance, these origins are traceable by noting how pageantry and staged events (pseudo events) are virtually timeless. For centuries, leaders of government, religion, and commerce have worked to inspire awe, mystery, and obedience through events staged purely for publicity and promotional purposes.

Mercantile activities have always required persons who can promote products, services, and business opportunities. Explorers opened trade routes and created treaty relationships to spark commerce. Shipping fleets, trade expeditions, and commercial relationships offer anthropologists insights into the forces that shaped cultures.

Governments of many types and in all regions of the globe were crafted by strong central leaders who used communication to manage their reputations, to coordinate ruling structures, and to command the loyalty of the governed. Often, changes in government have been associated with traditional public relations strategies, functions, and tactics. Scholars have identified the antecedents of public relations within the communication efforts to foster the War of Independence, which occurred after some of the colonies in the new America broke away from England.

Public relations is associated with all aspects of cultural growth and change. Political campaigns are the playground of public relations. European monarchies have used pageantry, diplomacy, warfare, executions, and managed marriages to create and change governments. Colleges and universities, in places as recent as colonial America and as old as the centers of education of Alexandria and Athens, used public communication to focus attention on their educational accomplishments. The creation and propagation of new faiths also provided public relations antecedents. Churches, perhaps most notably the Catholic Church, have used techniques to attract and keep converts loyal to the faith.

The historical antecedents of public relations, therefore, are often entangled with communication activities typically associated with what is called *propaganda*. Even well into the early decades of the 20th century, practitioners thought they were engaged in the practice of propaganda. Once that term became associated with manipulation, lying, and deceit, senior practitioners, such as Edward Bernays and John W. Hill, worked to divorce themselves and their practices from that aspect of public communication.

What we today refer to as public relations was born out of this historical plethora of activities. A brief discussion of some of these antecedents illustrates how the practice developed long before the 19th century.

A search for the antecedents of public relations might focus on tools, tactics, strategies, functions, and outcomes that characterize the profession today. Tools and tactics include rallies, events, newsworthy stories, editorials, buildings, logos, and treatises. Strategies are timeless: inform, persuade, identify, collaborate, compete, compromise, and negotiate. The functions provide some of the

strongest evidence: government relations, marketing communication, publicity, promotion, investor relations, employee relations, and student relations. Outcomes seem timeless: motivate people to buy, believe, fear, follow, live, and support. These lists are more suggestive than definitive. The following discussion indicates various examples suggested by these lists.

The range of historical antecedents is more limited if we think only of public relations as an organization's response to and utilization of mass media. If we think of public relations more as a rhetorical process of image, reputation, control, command, marketing, and organizational—even colonial empire—positioning, then it is likely to closely parallel the evolution of fledgling, formal, and ordered societies.

Given that positioning, then the history of public relations can be traced to ancient empires, such as Persia, Egypt, India, and China. The roots of public relations stretch back 4,000 years. They include the creation of the buildings, statues, idols, and governmental communication systems of highly sophisticated ancient societies. The ceremonial burial of leaders, even as deities, is part of the history of public relations. Throughout ancient societies, statues and other carved figures were widely used to capture the personas and personalities of government and religious leaders. Coins often carried a logo or the visage of a leader as a way of uniting that person or image with the national identity of a people.

Researchers seeking to identify the antecedents of public relations are prone to focus on instances of governments asserting power, church communication, mystery, and symbolism. One of the universal needs of people in power or those who seek power is to keep in touch with the opinions of a stakeholding public. A key realization of the powerful is that they rule and control only by knowing and molding or conforming with the opinions of key publics. Thus, for centuries those in power or seeking power have commissioned individuals to “conduct research” into the minds, wills, and motives of targeted publics. Some of this research was conducted by using espionage and even torture.

Antecedents include church communication, used by religious leaders of all kinds to disseminate the doctrine, foster loyalty to the faith, and establish the symbols of the church as a vital part of

people's lives. The antecedents of public relations include all of those sources of power. Power is displayed not only to intimidate but also to foster a sense of loyalty, submission, allegiance, and identification. It would be incorrect to suggest that the power of emperors, kings, sultans, pharaohs, and other magnates was always unwelcome and that allegiance was not warranted. Societies often emerged as people collectively created agriculture, science, and art. Strong central governments were a source of collective power needed to advance scholarship, technology, and commerce. Some researchers see this as part of the public relations of religion and government.

Antecedents of public relations can include the creation and manipulation of mystery, by secular and religious leaders. In particular, religious figures have maintained control and faith by demonstrating their understanding and perhaps even control of the mysteries of life. Uncertainty is uncomfortable; a disseminated (through public relations) certainty is comforting.

In addition to religious identification, antecedents include efforts to foster national identity. Flags, armadas, great walls, giant pyramids, and other symbolic displays are vital components of national pride and allegiance. Counselors of various kinds, in the style of senior public relations practitioners, offered advice and inspired efforts to demonstrate the power and success of governmental leaders. One widely examined antecedent is the public display of opposition and appeals for regime change. Another is the display of leadership. This application of public relations runs through many of the antecedents noted.

Although lost in time or unknown because of the limitations of travel, many roots of public relations were well established by Persian kings and the kings and emperors of China, Japan, and Korea. Refined pageantry, sponsorship of invention, poetry, announcements about agricultural advice and technology, and scholarship, as well as military display were the public relations stock and trade of these civilizations. Magnificent structures, mystery, and physical distance separated the rulers from the people. What was known and believed often resulted from proclamations and statements circulated to the people through the contemporary version of public relations practice. These might include the commissioning of poems, sagas, and

songs. Proclamations of antiquity find modern parallels in statements by corporate spokespersons and presidential press secretaries.

Once Philip II of Macedonia had subdued the regions of the Hellenic peninsula, he commissioned the creation of gold and ivory statues of himself to adorn the temples. He taught his son, Alexander the Great, similar techniques of power display. In one way or another, living beings were proclaimed or suggested to be closely connected with deities. Hannibal's army, like the armies of the Roman Empire, moved with great pageantry. They often proclaimed themselves religious or secular deities and used cruel methods to enforce their power. Symbols of power and spiritual connection were carefully honed tools that are antecedents to modern corporate and nonprofit logos.

Displays of power are a vital part of human history. Leaders by all titles have recognized the importance of developing and disseminating the symbols of power. Such symbols have at least two purposes: to foster identification and loyalty among the faithful, and to promote fear and intimidation in the enemies of the governing regime. Colors are an important part of this display of power. Generations of battle garb featuring England's red and gold with the sign of the lion were pitted against the blue and fleur-de-lis symbol of France. The return of victorious monarchs was carefully staged to foster identification and intimidation through the display of power. Burials, without parallel in Egypt and China, constituted great events used to empower parts of the public and deify rulers. The grand cities, including famous libraries, such as that at Alexandria, were designed to celebrate the prominence, power, and judgment of those who worked to keep themselves as rulers.

The Romans were masters of producing an event executed to have a public relations impact. Thousands of people witnessed long victory processions designed to proclaim the might of Rome and its ability to spread law throughout vast regions. Although the Romans did not invent the circus, they mastered this forum to demonstrate political and religious views. Great arenas were created that required advanced engineering and theatrical skills. Into these circus arenas entered chariot racers, wild animals, gladiators, and victims of religious oppression. Life and death were spectacles to show how the emperor and the people could make just and

final decisions, often merely for amusement, but always for ceremony to demonstrate the power of Rome. Not only were such displays intended to create identification by the people with Rome, but they also were intended to show other nations and competitors for political power how decisive and warranted were the rulings of the current emperor.

Religions traditionally focus attention on key figures symbolic to the faith. It is common for the personages of the faith to be captured and presented in various forms—statues, sacred artifacts, carvings, and paintings—including the personification of Buddha and other figures of various sizes. Paintings and statuary abound displaying the figure and face of Jesus Christ. The cross is a universal symbol, as is the sign of the fish. The Star of David has been a sign of religious affiliation and affection as well as a target of hatred. In 1622, under the leadership of Pope Gregory XV, the Catholic Church developed the concept of propaganda when it instituted the *Congregatio de Propaganda Fide*, the Congregation for Propagating the Faith. Members of many religious orders have been sent forth to propagate the faith, proselytizing potential converts to promise their adherence and support.

This battle for the faithful was ongoing. In 1351, John Wycliffe called for reform of the Catholic Church, including the publication of the Bible in the vernacular. Control of the Bible was an essential tool to display church power. Until the printing press and moveable print appeared in Western culture, the handwork of monks produced Bibles as a vital means for controlling access to the word of God. Bibles were physically as well as symbolically attached to churches.

Missionary activities are ubiquitous. Colors are often associated with religious leaders, such as the purple and saffron of the Dalai Lama. Religious buildings are part of this display, as is the ritual of religious expression. Pageantry and ritual play prominent roles in expressions of faith and allegiance to a religious creed. Parallels to secular expressions can be made. Such parallels do not intentionally undercut religious adherence but indicate the close parallels between lay and secular forms and a public's need to wrestle with mysteries.

Public executions often constituted dramatic events. They attracted crowds, frequently as a means of impressing the public with the laws and

power of the state. The Reformation launched by Martin Luther began with the dramatic event of the proclamation of the wrongs of the church. On October 31, 1517, he nailed the 95 theses to the door of the castle church in Wittenberg, Germany. Featured in these claims were denunciations of the role of indulgences in the daily lives of the faithful. Over the next century, many events and actions acknowledged the war among church leaders and the people. This battle included public burnings and other torturous executions of those whose faith put them at odds with the religious and secular leaders popular at the time.

Jousts were favorite pastimes in England, Germany, and France. Although they featured the prowess of individual knights, they were in many ways similar to military maneuvers and grand parades in later times. They provided opportunities for kings and other nobles to display the caliber of fighting equipment, men, and horses that could be brought to bear—sometimes in the pursuit of mercenary work.

The advent of democracy opened the doors to additional antecedents of modern public relations. In many ways, the efforts of Stephen Langton, archbishop of Canterbury in 1215, are quite modern. He mobilized a disgruntled group of barons who confronted King John with ultimatums that eventually matured into the Magna Carta. Similar challenges of government are instrumental to English and American history and are widely recognized as precursors to modern political campaigns. Through intrigue and pageantry, kings sought to control the people of England, for instance. Their rule was challenged by the church, reformation, national identity, and the spirit of the new world.

The events leading to the American War of Independence offer historians a clear link to the origins of public relations. The effort to create the sentiment for a Declaration of Independence required a sustained campaign. It included the use of all of the forms of mass communication of the time. It introduced images, slogans, and icons. It used cartoons. It created events, such as the Boston Tea Party. It mixed ideology with flaunted displays to challenge the authority of the king. At the same time, the Revolutionaries tried hard to avoid a direct clash with the House of Commons because it wanted to showcase the virtues of popular government. Clear evidence of what would be called propaganda by

the turn of the 20th century included the continuing publicity and promotion of the Revolution. Revolutionary leaders sought to create crises that would defame British control. They engaged in issues debates over principles, such as local sovereignty and taxation with representation. Colonists used pamphlets, newspaper broad sheets, and clever symbols, including burned effigies. The tools and tactics of the Revolutionaries constitute a list familiar to current practitioners. It included bonfires, fireworks, heroes and heroines, victims to substantiate claims of atrocities, exhibitions, slogans, speeches, and even crude lantern slides. Legends include Yankee Doodle and The Spirit of '76. The symbols of the Liberty Tree and a chopped snake accompanied slogans, such as "Don't Tread on Us." Committees were formed to create and disseminate the ideology, post lists of complaints, and organize events. Some patriots were skilled at recruiting rebels in taverns, where ample amounts of spirits hardened the patriotic resolve needed to oppose the British government and risk of death for being declared a traitor.

The activism and publicity components that were part of the formation of the new United States government are often included in discussions of the antecedents of public relations. Other aspects of this effort also deserve attention. Perhaps no better example of an issues brief exists than the Declaration of Independence. It was a careful articulation of the complaints justifying resistance to the British government's authority. Particular care was given to placing blame on the king rather than on the House of Commons. Also, as the new government struggled to survive, emissary efforts by Benjamin Franklin constituted early examples of the importance of skillful government relations.

The democratic spirit of popular governance and free election opened the door to myriad political campaign techniques that have long been the stock and trade of political public relations experts. Rumors, lies, and myths provided substance to political campaigns—people born in log cabins, men of the people, and Old Hickory are examples. Songs were crafted to praise one candidate and to defame his opponent.

Nevertheless, among the many antecedents illustrated, the origin of the term *public relations* is obscured. As long ago as 1807, Thomas Jefferson, the third president of the United States, combined

public with relations in a statement about the obligation of government to the governed. The more specific coinage combining those terms as a field may have occurred during an address by civil service reform pioneer Dorman Eaton to the Yale graduating class of 1882. Without a doubt, universities were some of the earliest organizations to use public relations. Medieval universities announced lectures and other academic achievements. In the 18th and 19th centuries, intercollegiate athletic competition drew crowds, which resulted in media announcements and student and alumni interest. Formally, and without reservation, by the end of the 19th century the term was specifically and functionally used in the naming of departments and activities by the railroad industry. Now, a fledgling profession by name is able to draw on centuries of practice as it refines techniques influenced by emerging and changing communication technologies.

ANTHROPOLOGY AND PUBLIC RELATIONS

Anthropology, defined as the study of “other” cultures, is relevant to public relations because the occupation continually engages with a range of ethnic, organizational, and occupational cultures. Anthropology is both a research practice, employing its signature methodology and ethnography, and an increasingly interdisciplinary academic discipline that intersects philosophy, sociology, psychology, cultural studies, literary criticism, and linguistics. Anthropology deals with many subjects

relevant to public relations, such as agency, structure, power, community, discourse, interaction, and interpretation. These connections between anthropology and public relations emerged as a consequence of globalization, facilitated by exploration, trade, and colonialism, as well as an interest in the circuit of culture.

The connection between public relations and culture is fundamental, as public relations is involved with “border crossings,” continually crossing cultures within and between organizations and communities. Public relations practitioners are culture-workers, but not only when they are involved in culture-change programs. Public relations is also involved in intercultural communications between different organizations, media and international stakeholders, and publics located in various countries.

Such work used to be referred to as international public relations, although this term has now been partly supplanted by the terms *cross-cultural* or *global public relations*. Public relations practice is discourse work concerned with ideas and opinions within organizations and among stakeholders and the broader public opinion. Public relations practitioners need to engage with cultural beliefs and practices, not just of national and ethnic groupings, but also of organizations, occupations (media cultures, public relations consultancy cultures), and many other communities, both face-to-face and online.

It is possible to think of various political parties as possessing different cultures, but there also are government/civil service cultures, financial/economic cultures, and technologized cultures. Thus, the concept of culture is central to the practice of public relations. It therefore plays a crucial role in the cultural developments where meaning is created, modified, and reinvented during processes of symbolization, representation, consumption and identity formation. Consequently, public relations scholarship, and its attached discipline may usefully engage with and interpret cultural experiences through the lens of anthropology and employ a range of anthropological concepts and terms, for example, ritual, myth, narrative, network, and stereotype. After detailing the emergence of anthropology as a discipline, this entry discusses its implications for public relations theory and practice and its use in public relations contexts. It adds detail

for understanding what has become the efforts of third culture public relations practitioners.

Emergence of Anthropology as a Discipline

Although anthropology has been extensively critiqued for its alignment with colonial powers, exploitation and domination, and its “Othering” (highlighting the perceived weaknesses of marginalized groups as a way of emphasizing the supposed strength of those in positions of power), anthropological excursions have also stimulated the development of reflexive thinking.

Accounts of the development of anthropology as a discipline highlight the significance of Bronislaw Malinowski’s (1884–1942) work in New Guinea and that of Alfred Radcliffe-Brown (1881–1955). Both had a strong interest in the structure and function of social systems, although their approaches differed. Malinowski sought to determine general laws and to specify the purpose and function of cultural practices within a particular social context. Radcliffe-Brown saw societies as ordered systems whose constituent parts play a role in maintaining equilibrium. He introduced a diagnostic approach to specify the factors that reveal otherwise hidden meanings in social practice. Structural-functionalism was largely concerned with social ordering and conflict resolution in societies that were sometimes presented by anthropologists as being stable and static (Macdonald, 2001).

A significant intervention was made by E. E. Evans-Pritchard, when he argued that language practices, such as the use of metaphor and symbolism in particular contexts, can produce specific situational meaning—which shifted anthropology toward meaning-orientated explorations rather than structure and function. Thus the construction and interpretation of meaning became foregrounded. (See Macdonald, 2001, p. 65, for this highlight of Evans-Pritchard’s contribution.) Evans-Pritchard’s approach is useful in reconsidering the application of systems theory to public relations and the extent to which anthropological origins and perspectives are acknowledged and taken into account. The fact that systems theory in public relations tends to focus on organizations as actors rather than on people as members of cultures may go some way to explaining the influence of functionalism and the delayed emergence of reflexivity.

Implications of Anthropology for Public Relations Theory and Practice

The implications of an anthropological approach to public relations are significant. It encourages a holistic approach to sociocultural environments and is a gateway to social theory. It encourages reflexive and interpretive approaches to scholarship, in particular toward the handling of the term *culture*, in ethnic, international, and organizational contexts. Specifically within organizational contexts, it helps public relations scholarship focus away from the notion of organizational culture as a management possession and to move toward interpretive accounts of organizational cultures and microcultures. Anthropology offers practitioners a conceptual source for reflexive analysis of multiple cultures and a tool for explaining communications issues, challenges, and relationships.

Sources Exploring Anthropology in Public Relations Contexts

The first connection made between public relations and anthropology appears to be that of Dr. Marcia Watson (2005), who constructed a bibliography of sources for U.S. practitioners. However, although it is relatively recent that ethnographic approaches have begun to be employed in public relations, ethnographic research in an in-house environment had been conducted much earlier in the United Kingdom by two organizational studies scholars, Ivan Filby and Hugh Willmott (1988). Attention to anthropology as it relates to public relations has remained a minority interest although it has been highlighted in various sources (L’Etang, 2010, 2011, 2012; Vuji-novic & Kruckeberg, 2010). Now there is an opportunity to follow the lead of media anthropology and the more strongly functional marketing anthropology (that uses anthropological and ethnographic insights in understanding consumer behavior) by developing the specialist field of public relations anthropology.

AP STYLE

In June 1953, the Associated Press instituted a classification that would change the history of writing for journalists, editors, teachers, and students. This innovation was named the *AP Stylebook*, which celebrated its 60th anniversary in June 2013. The 1953 edition consisted of 12,000 terms and 100 pages. It was written as a substitution for the first “16-page AP Style Book and the AP Copy Book, known as the Red Book” (Moynihan, 2003).

Although the 1953 edition was the foundation for future editions, Norm Goldstein, AP Stylebook editor for 14 years, stated that the 1977 edition was the beginning of upcoming, more precise versions (Moynihan, 2003). This is because the structure was changed and entries were organized in alphabetical order so that users could find what they needed in a timely manner. Louis D. Boccardi, Associated Press president and CEO, stated in an article on AP Style, “complication of style rules was accompanied by the accumulation of so much fact and information that the effort resulted in ‘a Stylebook,’ but also a reference work” (DiNicola, 1994, p. 64). Today, the *AP Stylebook* consists of nearly 500 pages.

The Associated Press defines the *AP Stylebook* as the “bible” for journalists and public relations specialists alike. Public relations professionals find the use of the stylebook very important in assisting them in their writing, since their work is routinely disseminated to journalists. Writers can check spelling, capitalization, grammar, punctuation and usage, with special sections on business, social media, food, fashion, and sports. Included is a guide on media law, with practical guidelines on libel law, privacy and copyright, as well as an effort to provide consistency for spelling and usage of digital terms, such as *website* and *email*.

The Elements of Style was originally written by William Strunk Jr. and E. B. White and is also an important book that writers use when dealing with style and word usage. This book, first called the “little” book, educates writers on how to use words in the proper manner, how to form meaningful paragraphs and how to use expressions correctly. It also consists of a section that reminds writers of the dos and don'ts in writing. For example, it explains the importance of rewriting and revising. It also encourages writers not to overstate their points and never to make the reader guess what you are stating. This is accomplished by clarifying what one means in a simple, comprehensive way. Subsequent editions were an attempt to modernize what many serious writers considered a classic work that was not in need of an update.

Many journalism teachers consider the *AP Stylebook* the most important tool in assisting students in their classes. It educates students on how to use certain writing techniques in different situations. For example, when using numbers, a student

is taught to always spell out numbers one through nine and to use figures for numbers 10 and above, with some exceptions, such as ages and percentages. The *AP Stylebook* also assists students with punctuation, spelling, government matters, state abbreviations, explanations about how court cases are written, and so forth. Teachers have found that entries within the stylebook, such as “political correctness,” can be used as a good learning tool. These issues open the door to dialogue and student participation about current events. While the *AP Stylebook* does not explicitly state guidelines for inclusion of entries, it makes an effort to take into account changes in language and social trends. A good example is the use of *sexual orientation* rather than *sexual preference*.

The *AP Stylebook* is often used as a guide for proper word usage, punctuation, and spelling for news releases, news stories, annual reports, brochures, media kits, radio and television news broadcasts, online content, and all other aspects dealing with public relations. Writing for the public relations field is similar to writing for journalism; this is why the same rules apply. Professionals have found that AP style is just as important in the profession as it is in classroom settings. The tools learned early on are implemented in one’s career. The *AP Stylebook* is now available in print, online, and in mobile versions, recognizing the needs of today’s professionals for easily accessible content.

Whether preparing a news release or a blog post, professionals and students have learned that writing is the most frequent form of communications. For one to communicate effectively, rules and guidelines must be followed. The *AP Stylebook* sets the foundation for this structure and these lessons learned in this “bible” shape today’s journalists, writers, teachers, and public relations professionals.

APOLOGIA

In today’s increasingly turbulent and mediated environment, individuals and institutions regularly face criticism for their actions. How they respond to allegations of wrongdoing comprises the form of communication generally recognized as “corporate” apology. A corporate apology is a response to accusations of ethical misconduct where the corporation as a social actor has the primary motive of the defense of its reputation and offers discourse in self-defense that denies, explains, or apologizes for its actions.

Although it may contain one, an apology is not an apology; instead, it is a justification of actions that seeks to present a competing interpretation of “the facts” and, in so doing, repair a damaged reputation. While the success of apologies at repairing damaged reputations is arguable, a central benefit appears to be the fact that they provide a conclusion for a negative story, one whose purpose is to disentangle individuals and organizations from a difficult news cycle. Given the fact that politicians have teams of strategists and speechwriters, they too are viewed as “corporate actors.”

The ability to navigate apologetic situations successfully is critical, given the high costs of creating a personal or organizational brand, the aforementioned turbulent media environment in which newsmagazines and 24-hour news outlets are incessantly on the lookout for more grist for the media mill, a dynamic and complicated legal environment, as well as the confessional nature of contemporary culture.

Crisis Situations

The study of apologetic communication has focused on understanding the situation that necessitates an apology as well as explicating the message strategies that constitute this form of address. Regarding any situation that necessitates an apology, early definitions focused on individuals and

argued that a charge was rooted in an ethical or reputational allegation. More contemporary definitions see apology as the result of allegations against not just character but also the policies of both individuals and institutions.

Given that a “legitimacy gap” exists between societal expectations for corporate behavior and the reality of how such organizations are seen to act, Keith Hearit (2001; 2006) has proposed that the situation that necessitates an apology is better conceptualized as a legitimization crisis; an apology is needed when organizational actions are seen to have violated commonly held public values resulting in public animosity and antipathy toward a company. In turn, this hostility takes the form of social sanction whereby media, consumers, and key opinion leaders criticize said organizational actions.

Apologia Strategies

As to the substance of corporate apology, scholars have spent a great deal of time and effort to articulate the different message strategies used by organizations. One strategy is denial, to reject charges by characterizing them as false. Those not in a position to deny that they committed an act often find it useful to deny that they intended to, for intent is a key factor in gauging culpability. Concomitantly, *bolstering* constitutes an identificational strategy that focuses on the strength and benefits of a past relationship. Corporations, for instance, bolster by reminding constituents of the number of jobs they bring to a community.

Strategies of redefinition are a major category whereby apologists are able to deal with the public perception of their guilt. Differentiation is one strategy where a narrow context is redefined into a broader one. A related strategy of redefinition is that of transcendence. Transcendence differs from differentiation in that the redefinition is to a broader, more abstract context and often has a religious dimension to it. Other strategies of redefinition include provocation, when a social actor claims that it simply reacted to the hostilities of another; defeasibility, used when corporate officers claim they were powerless in the face of forces beyond their control; or a good intentions strategy, where a company claims it had good intentions in creating a specific policy that only recently faces criticism. Finally, in minimization, an institution

seeks to lessen its responsibility by claiming that the problem is actually small or insignificant once it is properly contextualized.

Another strategy of redefinition includes the concept of dissociation. In using dissociations, organizations seek to deal with the problem of their guilt by claiming that criticisms are but an “appearance” and do not accurately reflect the “true facts” of the case. This dissociation often takes one of three forms. First, when the facts that precipitate an allegation of wrongdoing are in doubt, many apologists will employ an opinion or knowledge dissociation. In such an instance, an apologist claims that the media organizations that leveled the charges are trafficking in the realm of opinion and do not have all the facts. A frequent corollary to this approach is to level a counterattack against the accuser.

A second dissociational strategy used by apologists is a scapegoating strategy where the apologist uses an individual or group dissociation. As a rule, organizations go through great effort and expense to craft carefully constructed images; yet when wrongdoing occurs, such companies are quick to bifurcate such images by separating individuals from the group and locating guilt in those individuals. Such a move, then, transfers the guilt from the body as a whole to said individuals who can then be disciplined or fired.

A final form of dissociational strategy is that of accident/essence dissociation; here organizations find it rhetorically useful to claim a criticized act was an “accident” and that, as such, it does not represent the essence of the organization, which is made up of dedicated employees who should not be judged on one aberrant act.

Conciliation messages represent another major category of strategies used by apologists. They are chosen by apologists who decide it is in their best interests to utilize a strategy of mortification in which guilt is accepted and forgiveness is sought—typically in the form of an apology. A concession strategy rhetorically resonates more with audiences than any other approach. Conciliation attempts often are coupled with two additional strategies. The first, corrective action occurs when an organization announces steps that it is implementing to fix a problem and ensure that it does not happen again; and the second, compensation occurs when an organization reimburses victims in the form of monetary reparations.

Competing Tensions

Institutions caught in a wrongdoing face two competing tensions. On one side is the fact that an organization has committed a wrong, and it is the impulse of organizational officers to want to “do the right thing” and own up to their misconduct. Moreover, media and consumers clamor for an apology, the absence of which causes ongoing damage to an institution’s reputation. Finally, drawing from any number of ethical standards, it is easy to deduce that an accommodative message strategy is the preferred ethical response to the crisis situation.

Yet, standing in conflict to this so-called public relations response is the realization that corporate officials who choose to apologize and accept responsibility risk incurring direct costs for the organization in the form of significant liability judgments. Indeed, research has suggested that when caught in a crisis, investors respond to defensive message strategies favorably and view accommodative ones negatively. Hence, to meet its fiduciary responsibilities to its stockholder interests (the only interests enshrined in law) managers conclude that they *cannot* apologize. Organizations typically respond to such a quandary with equivocal communication through carefully crafted statements, which often include a statement of regret—where they acknowledge the tragedy or injury, but carefully construct their account to avoid assuming culpability. Such an approach puts an organization in the position of denying it has done anything wrong but promising never to do it again.

APP

An application (app) is a software program installed on a computer or mobile device that enables a user to perform a specific task. In computer parlance, all programs providing user interfaces are applications. Applications used by public relations practitioners in their daily work include word processing, spreadsheets, database, design, electronic presentation, email, and list maintenance software.

Apps are also employed in online public relations to disseminate information, engage users, enhance a sponsor’s reputation, maintain brand identity and online relationships, and facilitate two-way communication. The two primary types of apps are Web apps and mobile apps.

Web Applications

Organizations have experimented with Web apps since the inception of websites as public relations tools. Early examples included directories and store locators, forums and chats, and search and order processing tools. Organizations also created *widgets* (also known as *gadgets*)—short portable chunks of HTML code used to display organization-related information. Desktop widgets were provided to users to download and display on their

personal computer, while Web widgets were intended for installation on the user's webpages for viewing by visitors. Widgets were deployed to stream news headlines, weather updates from resorts and remote locations, stock quotations, traffic updates, status updates, and videos or rotating photographic images based on the interests of the user.

Web apps are especially evident today on social networking venues, such as Facebook, where for example organizations can feature up to 12 apps on a Facebook page. These include Facebook-provided apps, such as Events and Photos. Owners also can feature free or paid apps available from third-party app developers sanctioned by Facebook. Or Facebook-page owners can pay for development of a custom app that performs a unique function, such as promoting a product or cause via an entertaining game or contest.

Mobile Applications

The term *app* is synonymous with specialized software programs downloaded to smart phones and computer tablets. Apps provide users direct access to information or entertainment fare without the delays or distractions that can result from opening their mobile Web browser. Apps usually feature limited functions and thus are simpler to use. Content can be personalized to the user, who can customize the app's layout and functions based on personal preferences.

Mobile apps serve the same public relations purposes as Web apps. Users can seek answers to everyday questions, improve personal productivity, access news or information, enhance quality of life experiences, be entertained, request information, and place reservations or orders online. Public relations-related content includes, but is not limited to, product selection and use guides, maps and travel directions, transportation and events schedules, coupons and promotional offers, virtual tours, news updates, interactive games and quizzes, contests and sweepstakes, and promotional multimedia presentations.

Organizations can create simple custom apps using do-it-yourself online services or license the use of already existing apps from an app developer. These *white label apps* allow sponsors to feature their own brand and allow limited modifications

to an app's appearance and functionality. Similar to Web apps, organizations can retain an app development firm to create a custom mobile app offering proprietary or complex functions.

APR

APR (Accredited in Public Relations) is a voluntary professional certification for public relations practitioners designed to identify professionals with demonstrated competency and experience. Practitioners holding the credential may use the letters "APR" after their names.

The credential was created by the Public Relations Society of America (PRSA) in 1964, motivated by a desire to enhance the professional image of the field. At that time, it required passing oral and written examinations and a minimum of five years' public relations experience. Since public relations has no mandatory entry standards, such as educational exams or licensing, practitioner accreditation provided a way to distinguish highly competent practitioners from others and offered some form of quality assurance to potential clients and employers. Today, the APR certification is recognized as an important step in the evolution of public relations toward professional status.

The APR program is the largest certification program for public relations practitioners in the United States and has been the most successful in producing accredited members. As of 2013, approximately 20% of PRSA's members were accredited. According to PRSA, the average pass rate over the 5 years between 1998 and 2003 was 62%. Other organizations in the United States and abroad offer similar certification programs. Most notable in the United States is the International Association of Business Communicators' Accredited Business Communicator (ABC) designation. Internationally, a number of public relations professional organizations, including those in Australia, South Africa, and Great Britain, offer accreditation programs with criteria similar to those of current U.S. programs.

In the early 1980s, leaders of several public relations organizations in the United States began advocating for “universal accreditation,” the consolidation of multiple accreditation programs spread among a number of public relations associations. A unified accreditation program would help to standardize professional expectations for public relations practitioners, as well as the consequences for accredited practitioners who violate codes of ethics. Competing interests among professional organizations stymied these efforts for nearly 2 decades. Eventually, PRSA and eight smaller public relations bodies forged a partnership called the Universal Accreditation Program (UAP).

In 1998, oversight for APR certification was transferred from PRSA to the new consortium. UAP partners include PRSA, the Agricultural Relations Council, the National School Public Relations Association, the Religion Communicators Council, the Society for Healthcare Strategy and Market Development, and several state and regional public relations associations. A governing board composed of representatives from these organizations develops and maintains the accreditation examination and related policies, reviews appeals, and grants the APR accreditation. Day-to-day operations are administered at PRSA headquarters in New York.

Eligibility for accreditation is limited to members of UAP partner organizations who have at least five years of paid, full-time experience in the practice of public relations or in the teaching of public relations courses in an accredited college or university. Nonmembers who belong to member organizations of the North American Public Relations Council and who meet the same employment requirements as members are also eligible. Candidates must pay a fee of several hundred dollars and complete an application form. They may access a study guide, online self-study course, and instructions for preparing a portfolio from the Universal Accrediting Board.

Since its inception, the APR examination has required demonstrated understanding of the public relations body of knowledge and the ability to apply that knowledge in practice. Until 2003, the accreditation process required a written examination and an oral interview before a panel of accredited peers. In July 2003, after a 3-year period of research and testing, the UAP replaced the oral examination with

a preliminary “Readiness Review,” designed to assess whether candidates are likely to succeed in the written examination. The UAP also revised the written examination to cover 10 specific clusters of knowledge, skills, and abilities.

Once a candidate’s eligibility for the exam process has been confirmed, the candidate requests a Readiness Review through a local chapter of PRSA or partner organization. The Readiness Review is a one- to two-hour interview and portfolio presentation before a panel of accredited members. It includes a written submission submitted to the panel in advance that addresses open-ended questions related to the candidate’s position and experiences; a portfolio review; and an assessment of readiness to take the exam. The review panel uses a point system employing standardized criteria to assess the candidate’s responses and supporting materials, and scoring the candidate’s knowledge, skills, and abilities in 16 areas, including public speaking, interpersonal skills, writing skills, and management skills. If any weaknesses are identified, the panel suggests study materials to strengthen those areas. Candidates may not take the written exam until they pass the Readiness Review. Candidates who do not pass the Readiness Review portion of the process may repeat the Readiness Review after a waiting period. Candidates are informed of the panel’s decision by the UAP.

The computer-based written examination contains multiple-choice questions related to 10 competency clusters: public relations history and current issues; business literacy; ethics and law; communication theory; the public relations process of researching, planning, implementing, and evaluating campaigns; management skills and issues; crisis communication; use of information technology; media relations; and advanced communication skills, such as consensus building, consulting, and negotiating skills. The typical candidate requires 2 to 3 hours to complete the written exam.

Practitioners accredited in 1993 or later must document their continuing professional growth every three years in an accreditation maintenance program that requires the accumulation of points in continuing education, professionalism, or service categories. Accredited practitioners must maintain their membership in PRSA or a partner organization in order to continue use of the APR designation.

Although the accreditation of public relations practitioners is widely viewed as a step forward toward professionalism, it alone is unlikely to lead to universal acknowledgment of the value of public relations. However, within the field, increasing recognition of the APR designation is evidenced by public relations job listings that specify “APR preferred” as a candidate qualification. Although little research exists that compares accredited and nonaccredited practitioners, evidence does suggest that accredited practitioners are somewhat more likely to embrace professional values than nonaccredited members.

Accreditation remains a favorable alternative to licensing in the eyes of many practitioners, who view licensure as infringing on free speech rights and unnecessary governmental interference. Enforcement of ethical behavior remains a limitation of voluntary accreditation, however. Unlike failure to attain licensure, loss of accreditation does not prevent an individual from practicing public relations.

primary human experience, such as birth, sex, or death. Prominent archetypes often come in ideographic paired oppositions, for example, light and dark, heat and cold, disease and health. Archetypes are considered to be universal symbols because they are deployed across space, time, and cultures. They help humans make sense of experiences and aid their storytelling. To the extent that public relations has rhetorical groundings, it depends on archetypes.

Archetypes can be either things or ideas. They “exist” whenever a basic commonality can be demonstrated among diverse sets of communicative acts. They link seemingly discrete symbolic acts separated by time, space, and culture and align them into a coherent narrative.

Michael Osborne (1967) argued that archetypes arouse emotion because they provide “a kind of double association. . . . The subject is associated with a prominent feature of experience which has already become associated with human motivations” (p. 116). An archetype facilitates an audience's understanding and experience of community in situations where ceremonial communication is required.

The light/dark metaphor family provides a particularly salient set of archetypes. Osborne (1967) wrote, “It is most illuminating to think of these sources as kind of a spatial family in which light and darkness occupies [sic] the center, and the sun, heat and cold and seasonal sources range out from it in that order of proximity” (p. 117). Light associates with survival and developmental instincts, whereas darkness is associated with vulnerability and fear of the unknown.

Osborne also noted that no rhetorician was more aware

of the potential power of light and dark metaphors than Winston Churchill. When there is societal upheaval and contemporary forms of symbolic cultural identity are swept away, the archetype which represents the unchanging essence of human identity is turned to as the bedrock of symbolism. (p. 120)

ARCHETYPES AND RHETORICAL THEORY

An archetype is frequently used as a metaphor and is an original ideal or classic model that taps into a

Archetypes are also widely employed in coalescing communities. Lacking an inventory of shared symbols, rhetors (rhetoricians) call on archetypes in order to accomplish their metaphorical work.

Archetypal analysis begins with creative speculation. The critic identifies a potential archetype that

is believed to bring coherence to a series of communication acts dispersed over time, space, and culture. In the exploration and testing phase of archetypal analysis, the critic traces the use of the archetypal motif across those same concepts. If the analyst succeeds in showing that the motif recurs in persistent and important ways, they then move on to identifying concepts associated with the recurring image.

In the evaluation phase, the critic assesses how archetype usage illuminates the rhetorical preferences and practices of a culture. The critic can also examine how the meaning of an archetype shifts over time. Osborne (1977) found that the archetype of the sea accumulated new associations over time. In antiquity, it was conceived as a hostile environment that threatened civilization (i.e., the ship of state). However, by the time of the industrial revolution, the sea came to be seen as a place where one could escape the stultifying conventionality and oppressive working conditions of industrial society. The sea was still a challenging place, but one where an individual could test and prove oneself, or fail in the attempt.

Archetype analysis has been applied to diverse phenomena such as films, news stories, and political style, all of which have implications for public relations. Samuel Winch (2005) found that Osama bin Laden was constructed to fit the archetype of the evil genius in press coverage following 9/11. Although bin Laden was portrayed as an evil person, he was also depicted as being exceedingly intelligent, clever, and resourceful: a terrorist superman who was able to adapt to almost any contingency. That depiction created a worthy adversary to justify the “war on terror.” It provided an excuse for the failure to apprehend him. Winch speculated that the evil genius archetype was utilized because it could help most citizens of the United States understand the traumatic events of 9/11 that ruptured their taken-for-granted understandings. Archetypes can be constructed out of communication styles. Robert Hariman (1995) identified four political styles: courtly style, realist style, republican style, and bureaucratic style. These styles are resilient and widespread even after the original social structures that supported them have withered away. Hariman wrote, “We live in a vortex of discourses. Bureaucratic speech can be heard in the bedroom, republican oratory in the sports section, realist tropes in the synagogue and courtly tropes in the evening news” (p. 12).

Archetypal analysis is criticized for contributing to monolithic interpretations of particular archetypes.

Michaela Meyer (2003) argued that the rhetorical critic should demonstrate the multiple and oppositional ways that an audience can and should use when reading a text. For example, via criticism, the audience becomes aware of the deeper significance of the text. Criticism adds nuance and paradox to archetype interpretation.

Rhetoricians who work from an ideological (i.e., critical theory) perspective tend to be suspicious of archetype analysis, especially claims that archetypes are natural and universally understood. An ideological analysis seeks to identify communication practices that support the status quo and reproduce the power relationships supporting that status quo. Janice Hocker Rushing and Thomas S. Frentz (1991) argued that ideological analysis ignores symbols that index central thoughts that originate in the workings of the psyche (i.e., both individual and cultural). They proposed that the contents of human consciousness derive both from ideological sources and psychic sources. Neither source of symbols is reducible to the other. Thus, ideological analysis and archetype analysis need to be used in concert in order to provide a fuller understanding of how humans use symbols to create shared meaning and motivate action.

ASSOCIATION FOR WOMEN IN COMMUNICATIONS

The Association for Women in Communications (AWC) is a professional organization that champions the advancement of women across all communications disciplines by recognizing excellence, promoting leadership, and positioning its members at the forefront of the evolving communications era. This national professional organization also sponsors student chapters. Founded in 1909 with 2,500 members as Theta Sigma Phi at the University of Washington, the organization has evolved from an original narrow premise to now cover a broad range of disciplines. The founding principles of Theta Sigma Phi still serve as touchstones for AWC today: to promote the advancement and responsibilities of communicators, to work for the First Amendment rights and responsibilities of communicators, and to recognize distinguished professional standards throughout the industry.

AWC Annual Awards

The renowned Clarion Awards competition is open to all communicators. The awards annually recognize excellence in communication fields. The International Matrix Award rewards a communications professional for achieving the highest level of professional excellence. The AWC Headliner Award recognizes an AWC member who has recent national accomplishments as well as consistent communications excellence.

AWC Annual Professional and Student Chapter Awards

At the annual conference, the AWC Professional Chapter Awards are presented to AWC professional and student chapters that have excelled in leadership, communications, and community support. This includes the AWC Chapter Star Award and AWC Chapter Excellence Award. The AWC Student Chapters Awards annually recognize outstanding student members, advisors, and chapters

on the basis of leadership activities and contributions to school and community. These awards include the AWC Rising Star Award (highest achievement award for an AWC Student), AWC Outstanding Chapter Award, and AWC Outstanding Faculty Advisor Award.

AWC Nontraditional Awards

The AWC Hall of Fame honors women who have made a significant contribution to the communications field: locally, nationally, regionally, and internationally. The Hall of Fame recognizes those who have displayed the highest professional and ethical standards in the communications field. Given in the name of one of the organization's founders, the National Georgina MacDougall Davis Award recognizes continuous, distinguished service to AWC goals. The award may not be given more than five times in a decade. The Lifetime Achievement Award rewards longstanding professional accomplishments and service to the association. The Ruth Weyand and the Business Pinnacle Award is named in honor of a labor attorney who worked tirelessly for women's rights in the workplace. It recognizes companies with forward-thinking policies toward women and minorities.

Founded in 1997, the mission of the AWC Matrix Foundation is to promote the advancement of women in the communications profession by providing funds for education, research, and publications. It carries out its educational and charitable goals in cooperation with the AWC through three initiatives: (1) The Professional Certification Program recognizes excellence in all areas of communications and provides an opportunity to demonstrate communication and management skills and enhance employment/client potential; (2) The Edith Wortman First Amendment Award honors professional communicators for their efforts relating to First Amendment issues; and (3) The Barbara Erickson Scholarship Fund gives college students an opportunity to meet and mingle with professional communicators by funding attendance at the AWC National Professional Conference.

ASTROTURFING

Astroturfing, also known as greenturfing, is a disguising technique used by large organizations to support any arguments or claims in their favor. Astroturfing is usually a public relations, political, and advertising tactic carefully planned by an organization for manipulative purposes, but disguised as a spontaneous grassroots campaign. By giving the appearance of grassroots campaigns, an organization's astroturfing efforts attempt to influence public policy and manipulate public opinion. In fact, astroturfing is the fabrication of a grassroots campaign. The term originated from Astro-Turf, which is a brand of artificial grass carpeting designed to look like natural grass. The term was coined by U.S. senator Lloyd Bentsen in a public statement in 1985.

Astroturfing is distinguished from legitimate grassroots campaigns by its deceptive nature. First, one difference from legitimate grassroots campaigns is that finance is not an issue for astroturfing practice because it is often sponsored by deep pocket organizations. Second, it is driven by the vested interests of organizations and hired public relations, marketing, law, or political consulting firms, whereas grassroots campaigns are driven by the will of individuals or communities. Third, since astroturfing is a fabricated grassroots campaign, there is no strong expectation of public participation or empowerment in the practice. Lastly, unlike real grassroots campaigns, astroturfing uses front groups to mask the sponsoring organizations' true interests and identities. By using front groups, astroturfing organizations try to make fabricated grassroots campaigns appear as independent movements in the public eye.

Because of its deceptive nature, serious ethical concerns underline the practice. Although this practice is prohibited by the Public Relations Society of America (PRSA) code of ethics, it is not an uncommon practice of corporations, politicians, or public relations firms. Examples include American Chemical Society, American Forest & Paper

Association, Burson-Marsteller, Philip Morris, Procter & Gamble, the Chemical Manufacturers Association, and Union Carbide. For instance, in 1993 Burson-Marsteller, a public relations firm, created the astroturf group the National Smokers Alliance (NSA) to influence federal nonsmoking regulation on behalf of the tobacco industry, specifically Philip Morris. The NSA was originally promoted as an organization made up of individuals and businesses (particularly restaurants) that were against impending laws that would ban smoking in certain public places. Backed by Philip Morris and several smaller tobacco players and with millions of dollars and the help of the aforementioned public relations firm, the NSA ran aggressive campaigns to recruit people to beef up their membership numbers. The NSA, which claimed to be an independent grassroots group, was eventually ousted as a sham when the financial backing of the tobacco industry and strategic direction of a public relations firm were revealed.

Advanced technology and new electronic media certainly accelerate the process of creating Astroturf campaigns. Internet and social media can be used to organize astroturfing campaigns while successfully disguising them as grassroots campaigns. Thus, more emphasis on ethical guidelines for public relations practice is required in this ever-changing environment.

ATTRIBUTION THEORY

Why do people say what they say and do what they do? What causes behavior? Such questions are common ones in the explanation of human experience and are at the root of attribution

theory. Understanding causality and responsibility is pivotal in interpreting social behavior. Attribution theory explains how we assess the causes of our own and others' behavior. According to attribution theory, in sensemaking interactions reason "backward" from observed behavior to determine underlying causes so that they may be able to predict future behavior or know how to respond in specific interactions.

Although primarily used to examine interpersonal processing, attribution theory has been applied in other contexts. For example, W. Timothy Coombs applied attribution theory to organizations and publics as he examined perceptions of crises, especially as related to organizational reputation. When crisis events occur, individuals strive to explain their causes. If an organization is perceived to be responsible for the crisis, its reputation sustains damage. When conditions of stability (i.e., a history of such problems) and control are believed to exist, organizations are likely seen as responsible. Thus, attribution theory has promise for organizational and public relations research, especially in times of crises. For example, it has recently been employed to examine public support for Haitian earthquake victims and public responses to an oil spill as well as government responses to terrorism.

Three assumptions form the basis of attribution theory: (1) individuals assign causes to behavior, (2) individuals use systematic processes in explaining behavior, and (3) once attributions are made, they influence feelings and subsequent behavior and are resistant to change.

There are two types of attributions: internal and external. Internal (or dispositional) attributions place the cause for behavior within a person, whereas external attributions assign the cause to some factor outside (contextual) the person. In other words, internal attributions focus on the personal aspects of a person, including stable traits or characteristics, such as intelligence or personality; variable behaviors, such as effort; and temporary states, such as mood, stress, or exhaustion. Locating the cause outside the person, external attributions place responsibility on some force or agent in the situation or environment. Such agents include rules and restrictions, task difficulty, resource availability, and chance or luck. Once attributions have been made, they guide individuals in predicting future behaviors.

Considerable research has examined factors affecting the choice between internal and external attributions. For example, Fritz Heider (1958) discussed differences in self versus other attributions. Individuals tend to attribute responsibility for their own failures to external causes (e.g., bad luck) and the failures of others to internal causes (e.g., lack of intelligence or good judgment), and to attribute responsibility for their own successes to internal qualities (e.g., intelligence or good judgment) and the successes of others to external factors (e.g., good luck). Edward E. Jones and Keith E. Davis (1965) discussed three categories of information (i.e., choice, expected behavior, and effects of behavior) that shape whether internal attributions, which they call correspondent inferences, are made. For example, if we believe that someone behaved intentionally, by choice, in a distinctive fashion with low social desirability, we most likely attribute the cause for that behavior internally.

Widely regarded as the father of attribution theory, Heider (1958) said that like "naïve psychologists," people work to interpret human behavior—to understand *why* people behave as they do. Because many interpretations of a specific behavior are possible, he argued that we start to recognize individual patterns of perception, labeled "perceptual styles." Heider's theory has spawned considerable theoretical extension and research.

Most research in attribution theory has revolved around two models: Harold Kelley's and Bernard Weiner's. Kelley's model, or Kelley's cube, is especially concerned with attributions regarding the behavior of others and has been the "primary paradigm for describing how people use information to make social attributions for the behavior and outcomes of others" (Martinko & Thomson, 1998, p. 271). Weiner's (1995) work, involving the achievement-motivation model, is focused on self-attributions.

Although recognizing self-attribution, Kelley's work primarily covers attributions made to explain the behavior of others. Two tenets underlie this work. One is the covariation principle, employed with multiple instances of behavior, which asserts that "an effect is attributed to the one of its possible causes with which, over time, it covaries" (Kelley, 1973, p. 108). That means that when an observer has more than one instance of behavior to evaluate, the observer assesses which outcomes covary (i.e., are associated) with particular causes. The other

tenet is the discounting effect, which is used for single instances of observed behavior and suggests that “the role of a given cause in producing a given effect is discounted if other plausible causes are also present” (Kelley, 1973, p. 113). Specifically, observers assess possible causes relative to one another. These tenets assume rationality where behavior and varying possibilities are carefully examined.

According to Kelley, three types of information are employed in making judgments: consensus, consistency, and distinctiveness. Consensus asks, “Do other people exhibit this behavior in this situation?” If so, consensus is high; if not, consensus is low. Consistency asks, “Does this person exhibit this behavior in other situations like this one?” If so, consistency is high; if not, consistency is low. Distinctiveness asks, “How does this person behave in other situations?” If the person behaves differently, distinctiveness is high; if the person behaves similarly, distinctiveness is low.

Evaluations regarding this information lead to conclusions on causes—person, stimulus, or situation. Attributions are likely to pinpoint the person when there is low consensus, high consistency, and low distinctiveness. Attributions are likely to pinpoint the stimulus (or entity, such as an organization) when there is high consensus, high consistency, and high distinctiveness. Attributions are likely to favor the situation (e.g., event) when there is low consensus, low consistency, and high distinctiveness.

Beyond these three general categories (person, stimulus, and situation), Kelley did not address how information is used specifically in refining evaluations. Although attribution to the person is one of Kelley’s categories, his model does not address varying personal attributions. Assigning cause to effort or ability is an attribution to person. However, findings suggest that these attributions lead to different responses.

Weiner’s interest is in individuals’ interpretations of their achievements. The following are key achievement attributions: ability, effort, difficulty of task, and chance. In Weiner and his colleagues’ work, three dimensions of causality are used to predict these attributions. The first is control locus (i.e., internal vs. external). The second is stability, the degree to which change occurs across time (i.e., stable vs. unstable). For example, ability is seen as stable, whereas effort is variable. The third is controllability, whether something was intentional or unintentional.

First proposed by Weiner and colleagues in 1971 and later modified, this achievement-motivation model primarily dealt with examining one’s own behavior. The resulting judgments influence future beliefs about capabilities. Whereas Kelley’s model looks at processes involved in attribution formation, Weiner’s concern is motivational and behavioral outcomes. Although the focus is self-attributions, especially achievement-oriented ones, Weiner’s more recent work includes attributions of others’ behavior and social responsibility.

Although the Kelley and Weiner models have dealt with self and other attributions, they highlight different facets of related processes. Recently some attempts have been made to integrate the models.

Criticisms of attribution theory include its reliance on normative models, which assume logical processing of information, and lack of recognition of the role of emotion. Further, as Martinko and Thomson (1998) pointed out, as with other complex kinds of information processing, attributions result from the interactions of a number of variables. Several attribution biases are common, including the fundamental attribution error, actor-observer bias, hedonic relevance bias, false consensus effect, false uniqueness effect, self-serving bias, and male gender bias. Other concerns include dependence on experimental tests, issues with generalizability, and insensitivity to actual interaction.

AUDIENCE MONITORING

Audience monitoring originated to serve advertising and market analysis of radio and television programming. Public relations firms use it to gather public sentiment on an organization's reputation, and government agencies monitor during emergencies. During the 1930 to 1940s, audience monitoring provided critical information for advertisers who used the data to identify key markets for the sale of products and services. Initially, audience monitoring identified radio audiences and the size of an audience listening to a particular show. After Cooperative Analysis of Broadcasting (CAB) was developed, audience monitoring continued to identify the best way to sell a company's product. Telephone surveys were used to gather data on the audience, but telephone households were often limited to families with higher socioeconomic status.

Clark-Hooper, Inc., is credited with changing the data collection process for audience monitoring. Instead of waiting to conduct a telephone survey after the program ended, Clark-Hooper, Inc., adopted the coincidental technique. This technique collected audience monitoring data during the airing of the radio program. As result, recall bias was not an issue as it had been previously with CAB's work. These data were more reliable, reduced the sample size (which reduced expenses), and created datasets that could be compared year to year.

Another key pioneer in audience monitoring is A.C. Nielsen, who developed methodologies for

radio and television analysis that are still used today. Nielsen is credited with creating The Audimeter, a mechanized data recorder that collected the following information: status of radio set (i.e., set is on or off), the time of day, the length of time the set was turned on, and the program station. Using The Audimeter, Nielsen was able to create a stratified sample and maintain internal consistency by controlling for the number of radios in the home, geographic location, size of locality, family size, occupation, home, race, and telephone ownership. Advertisers and show programmers received data on public dissatisfaction with programming, frequency, length of tuning, audience flow, reach (duplication among programs), and an estimated size of audience during a commercial break.

Over the past 60 years, audience monitoring has evolved to analyze cross-platform programming (e.g., watching television programs on smart phones or computers). Today information technology provides consumers with unprecedented decision-making power on when, where, and how they watch television or listen to radio programming. Nielsen continues to advance analysis efforts, but audience monitoring is no longer solely used for sale of products and services. Agencies often analyze media reports as proxy for audience feedback. Through qualitative analysis, communicators identify key themes, information gaps and rumors or misinformation, which provide key data inputs for the development of public information messages. Through advances of social media, organizations can monitor public comments and posts created by the general public. The pervasiveness of social media and its use during emergencies led to the development of the American Red Cross Digital Operations Center. It actively monitors social media to inform decision making related to emergency operations and public information activities.

AUSTRALIA AND NEW ZEALAND, PRACTICE OF PUBLIC RELATIONS IN

In Australasia, the practice of public relations is in a state of flux due to the rapid rise of new media and new modes of communication. The increasingly mobile and social basis of communication is challenging for the organization-centered practices of public relations that have grown up in both countries. As Jim McNamara (2010, p. 8) asserted, “The control paradigm of media is collapsing.”

The first public relations professionals in Australia and New Zealand were journalists who moved into the field of media relations. In previous decades, the path between media organizations and public relations—and back again—was well trodden in both countries. Today, the journalist ranks of media organizations are thinning as online media threatens the profitability of traditional media outlets, and media relations is a shrinking component of public relations practice. At the same time, the emergence of public relations as a profession in its own right means that practitioners are now almost exclusively recruited from the ranks of university and technical institute graduates, with specialist qualifications in public relations and professional communication.

The emergence of public relations as a stand-alone profession can be traced back to the close of World War II. In Australia, public relations practitioners in New South Wales became the first to form a professional body in 1949. Today, each Australian state has a division of the national professional body, the Public Relations Institute of Australia (PRIA). In New Zealand, the profession traces its inception back to 1954, when a group of demobilized military press officers formed what was to become the Public Relations Institute of New Zealand (PRINZ). In the days before airmail or the Internet, New Zealand and Australia were isolated from developments elsewhere, but relevant information was sought from the United States and Europe, leading countries in the field of public relations.

Public relations was originally practiced as an organizational or political function, and the primary task was to secure positive media coverage. Practitioners worked as consultants or internal organizational media and publicity experts. Anyone—regardless of education, experience, or understanding of ethics—could claim to be a public relations practitioner. There is still no requirement in either country for a public relations practitioner to belong to one of the professional associations, so the role of public relations practitioner has not been regulated or standardized. Titles given to or adopted by practitioners include corporate communications, business communications, corporate affairs, media relations, press officer, in-house journalist, external relations, and executive assistant. Titles that do not include the term *public relations* are sometimes chosen out of a desire to dissociate the position from public relations or in an attempt to elevate the position. The public relations industry in both countries is focused on achieving professional status but is subject to media disparagement.

Acknowledgment of public relations as a “profession” has been complicated by the voluntary nature of PRIA and PRINZ membership. Both professional bodies provide education and professional standards and promote the role of public relations, but practitioners are not compelled to join. In joining either PRINZ or PRIA, practitioners are arguably demonstrating their commitment to the development of public relations as a profession. However, they are also submitting themselves to the external rigor and security to be derived from an accreditation system and a code of conduct or ethical practice. In both countries, practitioners who have been accused of misconduct generally choose to avoid censure by resigning. PRINZ had over 1,000 members in December 2012, while the membership of PRIA stood at 3,000. In both countries, the majority of members are women.

Education has been a key factor in the progress of public relations as a profession. Public relations education is now widely available in both Australia and New Zealand. Students may take degree and diploma courses at universities, polytechnics, and technical and further education (TAFE) institutes. Practitioners can select from a wide variety of short courses run by PRIA and PRINZ or any of a variety of private training organizations. PRIA also oversees an accreditation system for public relations courses, which guides students toward

qualifications that have industry recognition. No similar system exists in New Zealand. PRIA and PRINZ are not, however, the sole organizations serving the interests of public relations practitioners in Australia and New Zealand. The International Association of Business Communicators (IABC) has strong membership in Australia, but the New Zealand chapter recently closed. Unlike PRIA and PRINZ, IABC does not offer accreditation examinations for practitioners, nor does it administer a disciplinary process for members who transgress the organization's code of conduct. Accreditation examinations were initially a source of tension for PRIA and PRINZ because senior practitioners resisted the notion that they should take an examination in order to be an accredited member of the professional body; but, there is now greater general acceptance of the accreditation process.

Professional public relations codes of ethics or conduct are now commonplace internationally, and within Australia and New Zealand, PRIA and PRINZ are the professional bodies that devise and implement the codes of ethics. Australia has two separate codes in operation: the Consultancy Code of Practice and the Code of Ethics. The Consultancy Code of Practice has sections on "general standards" and "client relations," as well as guidelines for fees and income. According to the "general standards" section of the code, a registered consultancy

accepts a positive duty to observe the highest standards in its business practice and in the practice of public relations; promote the benefits of public relations practice in all dealings; and improve the general understanding of professional public relations practice. (Public Relations Institute of Australia, 2001, n.p.)

Consultancies are thus charged with responsibility for "professionalizing" public relations and strengthening its reputation. This section also binds consultancies to observe the code, to adhere to "the highest standards of accuracy and truth," to ensure that employees adhere to the code, and to refrain from recruiting the staff of their clients.

The "client relations" section of the code sets out a framework for the conduct of relationships. This section requires consultancies to safeguard client confidences unless required by a court of law to divulge them. Consultancies are also barred from

offering their services simultaneously to clients with competing interests. They may not make unrealistic promises to clients. Soliciting others to engage in unethical conduct on behalf of clients is also prohibited. Australian consultancies are not required to either affiliate with PRIA or apply the Code of Practice. However, a register of affiliated consultancies is operated by PRIA, and only those consultancies that adhere to the code are able to list their services in this widely used directory. Thus, there is a real incentive for consultancies to affiliate. PRINZ also has a register of New Zealand public relations consultancies. However, the absence of a consultancy code of practice means that the list functions as a trade directory rather than as a mark of professionalism.

PRIA and PRINZ each have a code of ethics for individual practitioners. The PRIA code focuses primarily on the obligations of practitioners to clients and employers. Overall, the PRIA code is more extensive, with an emphasis on the activities of consultancies. The PRIA code is designed to ensure that members comply with PRIA's professional standards. Members are required to "adhere to the highest standards of ethical practice and professional competence." Key regulations include public relations practice (honesty, fairness, and confidentiality), business practice (treatment of clients and employers), and commitment to the profession (promoting the profession, building the body of knowledge, and surveillance of other members' practices).

The current PRINZ code of ethics was developed in response to concern over an ethical issue that focused media attention on the profession and tensions in organizational versus societal obligations. In New Zealand the profession faced a major problem following disclosures in a book titled *Secrets and Lies: The Anatomy of an Anti-Environmental PR Campaign*. This 1998 book by Nicky Hagar and Bob Burton mapped a prominent New Zealand public relations consultancy's role in assisting industry to continue the logging of native forests. The book accused the consultancy of a range of activities, including spying, lying, media manipulation, and undermining the democratic process. Following censure, the practitioner involved resigned but has since rejoined PRINZ.

In response to the media criticism and public condemnation of such practices, PRINZ developed a new code of ethics. The code marked a shift in understanding of the role of public relations. Public

relations was no longer conceptualized and promoted simply as a communication role but was explicitly repositioned as an advocacy function that promotes an organization or client's identity, ideas, products, services, or position. The code emphasizes the sensitive judgment required for acceptable and ethical public relations practice: "We must balance our role as advocates for individuals or groups with the public interest. We must also balance a commitment to promote open communication with the privacy rights of individuals and organisations" (Public Relations Institute of New Zealand, 2001, n.p.). Although the code does not specify how that balance should be determined, it does make it unmistakably clear that public relations obligations and responsibilities extend beyond the client to the public interest. Similar to the code of the Public Relations Society of America (PRSA), the PRINZ code of ethics outlines a set of values that guide behavior and decision-making processes. The PRINZ values are advocacy, honesty, expertise, independence, loyalty, and fairness. The code then sets out the principles and standards for the practice of public relations in New Zealand. Members are required to balance advocacy and honesty as well as openness and privacy, disclose conflicts of interest, abide by the law, and act in a professional manner.

The codes of Australia and New Zealand are therefore different in orientation. PRINZ has redesigned its code to more accurately explain the advocacy role of public relations and position that role within the context of society, whereas PRIA is more concerned with client/employer relations. However, both codes aim to provide a professional standard for public relations practice and enhance the reputation of the industry. Both PRIA and PRINZ are members of the Global Alliance for Public Relations and Communications Management, collectively representing 160,000 members. The Global Alliance is a framework for public relations associations to "share ideas and best practices, seek common interests and standards, and better understand the unique aspects of each culture in which practitioners operate" (Global Alliance for Public Relations and Communication Management, 2002, n.p.). The Global Alliance has established a protocol on public relations that is based on the "fundamental value and dignity of the individual" (n.p.). This individualistic focus may create challenges for public relations associations that have more collectivist, community-based values. For

example, PRINZ has to balance the dominant Western individualist focus with the more collectivist values of the indigenous people, the Maori. The Global Alliance protocol is based on the principles of advocacy, honesty, integrity, expertise, and loyalty. The ethical standards of the protocol emphasize responsibility to clients, client publics, and an informed society, along with professional competence, development, and commitment to the public relations industry. Membership of the Global Alliance gave PRIA and PRINZ greater access to international networks, knowledge, a virtual ethics forum, news, and examples of best practice. Moreover, the staging of the World Public Relations Forum 2012 in Melbourne saw Australia take a leadership role in the development of what became known as the Melbourne Mandate, which is a "call to action for new areas of value in public relations and communication management" (www.globalalliancepr.org/website/news).

The major practice-related issues confronting practitioners are similar in Australia and New Zealand. Western global business practices have come to dominate the practice of public relations, although they are to some extent balanced by local multicultural and bicultural policies and issues. Information and communication technologies, including the Internet, email, databases, mobile telephones, and personal computers, have all accelerated the process of globalization. Technology is also responsible for enabling public relations practitioners to rapidly disseminate information on behalf of their clients to wide-ranging audiences. However, in Australasia, as elsewhere, technology has also given voice to a wide range of stakeholders and stakeholder concerns, making the work of practitioners more complex and challenging. Public relations is no longer something that is the preserve of the organization. Any individual or community group with access to computers and the Internet can set up websites, issue media releases, and lobby decision makers.

Public relations practice in Australia and New Zealand is characterized by a small market size, which results in a high degree of informalization, accessibility, lack of specialization, and localization. Media relations in the two countries are rendered less formal because public relations and media professionals are often educated together and work together. Common backgrounds and experiences mean that public relations practitioners are able to

informally approach journalists with the expectation that they will receive positive media attention and possible coverage. This degree of informality results in what Norman Fairclough (1995) termed *cultural democratization*, greater accessibility to public figures and a reduction of elitism.

Another consequence of smaller market size is that public relations practitioners are more likely to develop generalist skills rather than specializing in a particular public relations function. Within the smaller consultancies in Australia and New Zealand, practitioners must be able to undertake a range of tasks, such as lobbying, managing events, and developing corporate brand and reputation programs. Although international public relations consultancy firms have affiliates and offices in both Australia and New Zealand, the work is most often based in those countries rather than internationally. Australia has a multicultural policy, whereas New Zealand has a bicultural policy that is enshrined in the Treaty of Waitangi, a document that acknowledges the rights of the Maori. Consequently, localized public relations approaches develop that embrace multicultural and bicultural communication and relationship challenges.

A growing sophistication in the understanding of public relations is evident within both public relations associations. A previous national president of PRIA, Liz McLaughlin (2002), argued that Australian public relations has matured from “words to strategies to leadership” and that practitioners need to work toward being part of the dominant coalition (p. 113). For McLaughlin, the challenge for public relations professionals is to balance the leadership role that public relations plays with a responsibility to society. PRINZ has indicated that public relations is centrally concerned with stakeholder management. In a similar vein, the former national president of PRINZ, Tim Marshall (2003b), promoted the role of public relations as “stakeholder communication, public consultation and education, and reputation management” (n.p.). Public relations has thus moved a long way from its early origins in a press agency to position itself as part of the senior leadership team in organizations, with responsibility for stakeholder management. However, the evolution is by no means complete as public relations continues to undergo significant change due to the rise of social media, mobile communication, and the shifting balance from verbal to visual communication. Just how the profession will

respond to publics that are connected, empowered, and global remains to be seen.

AUTHENTICITY ON SOCIAL MEDIA

Authenticity on social media can be affected by many communication protocols, such as using an actual photo as a profile picture on Facebook and Twitter or using a conversational voice that exudes being genuine and transparent. Thus, the essence of authenticity is being what one seems to be rather than being “inauthentic” and manufactured to achieve some self-serving end. In public relations, advertising, and marketing, having a social media presence that is deemed authentic is vital to efforts to achieve brand equity and branding.

Users of social media believe that the medium should be an extension of reality, as if both persons communicating are right in front of each other. Authenticity is a social construct guided by communication protocols; for instance, most users of social media will not “tweet” or update their statuses with no concern for the audience. Thus, no absolute rules define what constitutes authenticity within social media; instead, social media users must consider authentic what is in each context. What is considered authentic constantly changes and what symbols or signifiers mark something as authentic change based on each context. Authenticity is constructed based on what is inauthentic at the time.

To be perceived as authentic on sites with large audiences, such as Facebook, social media users may choose status updates or post details that they believe their acquaintances will find the least offensive. Similarly, Twitter users, in an effort to negotiate multiple and overlapping audiences, may strategically conceal information and target their tweets to different audiences while attempting to be authentic and portray an interesting personality. Social media users must maintain a balance between personal authenticities—sharing personal information versus keeping certain information private from particular audiences.

In public relations, using social media as a tool for branding and promotion works best when coupled with honesty. Companies need to find the

space between marketing their products or services and maintaining a human connection with their audiences. Using social media to create a personal brand involves the following: projecting who you are clearly and consistently; promising value to consumers; and differentiating your business, product, or service from others. It also allows the business to focus on its strengths. Such efforts require genuineness, which can be destroyed if it is discovered that practitioners are voicing comments about a product for hire while pretending to be “ordinary customers.”

Authenticity is also tied in with trust and credibility. Self-disclosure is important when attempting to gain audience trust. Relationships created through social media are seen as voluntary and are based on trust and mutual reflexivity and self-disclosure. This give-and-take relationship involves honesty and transparency, which lead to authenticity.

Being authentic on social media is not without its challenges, especially for businesses, who are attempting to reach out to customers while trying to control messages.

B

BACKGROUNDER

A backgrounder is one of many written public relations tactics that often supports and explains an accompanying news release. It is an in-depth document that provides an information base by offering relevant background information on the reporting organization. Backgrounders can be a good reference tool for journalists, who want an explanation of main areas of interest relevant to their target audiences. They are often included as collateral materials in a press kit or distributed at a news conference.

Backgrounders are similar to a more detailed version of a fact sheet, usually presented in a brief “who-what-when-where-why” outline or bulleted format. The factual information is presented in that traditional list (the five Ws) of journalist topics. The details are featured to make the writing of the story easier and more orderly. Both backgrounders and fact sheets are objective in nature, which makes them different from *position papers*, sometimes called *white papers*. Position papers usually take a stance or position on a particular issue. A position paper uses evidence to make a case for the specific viewpoint of the organization. A backgrounder, however, is a more neutral and thorough examination of either a specific topic or the organization in general.

Backgrounders normally appear on organizational letterhead and are between one and five pages long. They may be written in one of two styles: a concise, inverted-pyramid style; or a longer,

more descriptive narrative style that provides more depth than a news release. It is important to avoid jargon and advanced, industry-specific language unless the backgrounder is designed for a specialized or technically oriented audience, as for a trade publication. Backgrounders are meticulously researched and often require the use of subheads or main points of interest so that the reader can skim and quickly digest the most relevant material.

The content of a backgrounder can include information on organizational management, organizational history, biographical information on the company CEO, target markets, products or services, testimonials, explanations or elaborations of the findings of a survey or other research, and the organization’s website address. Because a backgrounder often provides supplemental information to an accompanying news release, it can contain material on any topic that helps a journalist write a comprehensive story. A backgrounder is usually longer and more general in content than a news release, which is limited to information announcing a specific news item.

When composed for an external audience (such as journalists), it is essential that the backgrounder appear in a journalistically approved style. As with a news release, no payment or compensation is made if the content of the backgrounder is published. Also similar to a news release, backgrounders are sent on the basis of news interest and timeliness for the audience. They can be very valuable for a journalist and are often kept on file for future reference by both journalists and public relations practitioners. However, they should be

updated regularly to keep information current and accurate. Other external audiences for a backgrounder include opinion leaders, regulators, legislators, and special interest organizations. Backgrounders can also be used for internal audiences as an information resource for management and employees. For example, they may supplement content for speeches, annual reports, or internal magazines.

BARCELONA PRINCIPLES

Evaluating the impact and measuring the effect of communications campaigns is one of the hardest parts of explaining and justifying what public relations is and how it can contribute and add value to organizations and society. The Barcelona Principles are a set of guidelines intended to help practitioners articulate how to measure the impact of their campaigns. The principles were developed in 2010 when more than 200 communications and measurement specialists from more than 30 countries met in Barcelona. The principles are described by Robert W. Grupp as “a new declaration of standards and practices to guide measurement and evaluation of public relations.” Seven principles were developed during the conference, which were intended to move the public relations practice forward in terms of measurement and evaluation of campaigns. The aspiration was to provide greater structure, consistency, and rigor to the evaluation process and most importantly challenge and

fundamentally reject long-standing and flawed methods still being applied by practice, principally the use of advertising value equivalents (AVEs). The Barcelona Principles that were developed from the conference are briefly discussed and explained below to provide a context and understanding of their purpose.

1. Importance of Goal Setting and Measurement

Firstly, communication campaign goals should be clearly identified. This principle argues for the goals to also be as quantifiable as possible to facilitate measurement. The measurement identified should address what impact is expected on stakeholders. Critics have questioned the assumption of quantitative measurement's superiority over qualitative, which is equally and, in some schools, more commonly used in academic communication research. This principle and the role of qualitative elements are built on subsequent principles.

2. Media Measurement Requires Quantity and Quality

This principle develops the first principle and acknowledges that some measurement approaches record relevant data (i.e., the numerical scoring or counting of clippings or impressions) but do not adequately account for measurement impact in more qualitative terms, such as tone, credibility, source, and media outlet. This principle therefore suggests building on the first principle and recognizing the nuance of media impact.

3. AVEs Are *Not* the Value of Public Relations

The powerful message and the most reported outcome of the Barcelona conference and the subsequent principles was the confident statement recorded in the third principle that AVEs do not measure the work of public relations. At the conference 92% of delegates agreed with this principle statement. The gap and the challenge, of course, have been to identify what the alternatives are to AVEs. This debate continues and has been reflected in practitioner, academic, and online debates.

4. Social Media Can and Should Be Measured

This principle argues that organizations need clearly defined goals and outcomes for social media. As with traditional media, evaluating quality and quantity is critical. Media content analysis should be supplemented by Web and search analytics, sales and customer relationship management (CRM) data, survey data, and other methods. In addition, the Principles claim that given the scale and volume of social media, technology-assisted analysis may be necessary. Measurement of social media must focus on conversations and communities, not “coverage.” Finally, understanding reach and influence is important, but existing sources are not acceptable, transparent, or consistent enough to be reliable. The suggestion is that experimentation and testing are keys to success.

5. Measuring Outcomes Is Preferred to Measuring Media Results

The fifth principle develops further the first and the second. Clearly the statement rightly supports that outcomes take variable forms, such as attitude and behavior change, policy and practice influence, etc. In essence the principle acknowledges the qualitative component more fully but also expands and explores the scope and influence of research understanding and the importance and benefits of applying consistent research methods and practice from both qualitative and quantitative traditions.

6. Business (read: Organizational) Results Can and Should Be Measured Where Possible

In this principle practitioners are encouraged to record and measure the impact public relations has on traditional business outputs more transparently, essentially measuring the impact on business performance such as sales. This is arguably something many public relations managers have been doing, but the principle reinforces the need in the context of integrated marketing communication strategies where public relations makes a significant contribution that needs to be isolated and measured.

7. Transparency and Reliability Are Paramount to Sound Measurement

The final principle is a clear acknowledgement of the knowledge and understanding that already

exists in academic research across many disciplines. Essentially this relates to conducting research, which falls within the basic structures of methodological practice and aims to achieve reliability, validity, transparency, and therefore research that is replicable where possible. This is an important recognition that demonstrates that practice in public relations continues to lag behind other business disciplines in adopting and using academic research to support and underpin the development of the discipline and practice.

The Barcelona Principles have been subsequently debated at follow-up conferences. They received mixed responses with many practitioners endorsing and supporting them while academics are more challenging and questioning of the impact and effect they have both on practice and on moving the discipline forward. Even if the Barcelona Principles are not particularly imaginative or innovative, they provide some simple guidelines and rules for engagement on the much-debated issue of measurement and evaluation. So far, they have not provided a silver-bullet solution to the problem. What is positive is that they provide a clear and transparent set of basic standards and best practices. They also inspire a mind-set change to support and propose more thorough analysis and measurement of communication campaigns. The principles have made an impact in helping the practice move away from the use of AVEs and place measurement at the center of developing a communications strategy.

BARNUM, P. T.

Doug Newsom, Judy Vanslyke Turk, and Dean Kruckeberg (2000) concluded that public relations played a substantial role in the growth of America's entertainment industry. They wrote that the tactic of *press agentry*, defined as "a function of public relations that involves creating news events of a transient, often flighty sort" (p. 533), grew up with the entertainment business in the 19th century. Perhaps no one is more completely identified with that tradition than P. T. Barnum.

Newsom, Turk, and Kruckeberg (2000) described Phineas T. Barnum (1810–1891) as one of many "circus showmen" who practiced press agentry (p. 37). If 20th-century public relations grew out of 19th-century press agentry, then public relations practitioners should be familiar both with what press agentry was, especially as practiced by Barnum, and with the effects that Barnum's actions had on the way that public relations is viewed today.

In *The Fabulous Showman: The Life and Times of P. T. Barnum*, Irving Wallace (1959) wrote that Barnum considered himself more of a promoter and a "museum man" than a "circus man" (p. 226). According to Wallace, Barnum did not become a full-time circus proprietor until after his 60th birthday, and even though he "gave the circus its size, its most memorable attractions and its widest popularity," the misconception persists that he invented the circus. In fact, the modern circus was created in England by Philip Astley in 1768.

According to the website www.ringling.com, Barnum joined promotional forces with James A. Bailey and James L. Hutchinson in 1881, and in 1888, the "Barnum & Bailey Greatest Show on Earth" first toured America. Barnum died in 1891, and Bailey followed him in the spring of 1906. In 1907, the Ringling brothers of Baraboo, Wisconsin, purchased Barnum & Bailey Circus, their largest competitor. In 1919, the two entities

merged, forming Ringling Bros. and Barnum & Bailey®, The Greatest Show on Earth®, as it is still known today.

A closer look is needed to explore the years of Barnum's life that led up to his circus days.

In the year 2000, Barnum's autobiography, *The Life of P. T. Barnum, Written by Himself*, was reprinted (it was first printed in 1855). In the introduction, Terence Whalen (2000) wrote,

For more than fifty years, Phineas T. Barnum embodied all that was grand and fraudulent in American mass culture. His life spanned nearly the entire nineteenth century, and during that period he inflicted himself upon a surprisingly willing public in a wide variety of roles. Barnum's supporters pointed to his exemplary success as a newspaper editor, lottery agent, museum director, politician, traveling showman and distinguished public benefactor. Barnum's detractors, however, used different names to describe his meteoric career: libeler, swindler, huckster, demagogue, charlatan and shameless hypocrite. (p. vi)

Whalen (2000) also observed that Barnum "desired and deliberately fostered this ambiguous public image" and that it was through his use of the new publishing industry and as a notable author that he constructed this image (p. vi). In the 2001 update of *Introduction to Mass Communication*, Stanley J. Baran confirmed that "mass circulation newspapers and the first successful consumer magazines appeared in the 1830s, expanding the ability of people and organizations to communicate with the public" (p. 251).

After a Danbury, Connecticut, newspaper refused to print a letter from Barnum, he decided to publish his own weekly newspaper, the *Herald of Freedom*, which commenced publication October 19, 1831. Of course, this wasn't without incident. During his three years as editor, Barnum was prosecuted three times for libel and at one point was fined and sentenced to 60 days in jail. But on the day he was released, Barnum made sure it was a "media event and public-relations triumph. He achieved this by assembling carriages for a procession, engaging a band and organizing a large celebration dinner" (Whalen, 2000, p. xiii). Whalen (2000) concluded that "in a more modern sense, Barnum acted as a prototypical spin doctor, for he

understood that the social meaning of an event (or crime) was not given from the start, but could instead be created or manipulated through the emergent mass media” (p. xiii).

Newsom and colleagues (2000) identified Barnum as one of the most famous and successful 19th-century press agents and credited him for creating, promoting, and exploiting the careers of many celebrities. They cited the example of Barnum exhibiting a black slave in 1835 named Joice Heth, claiming she had nursed George Washington 100 years before and reported how newspapers fell for the story, intrigued by its historical angle (Newsom et al., 2000, p. 38). Whalen (2000) claimed that although Heth was reputed to be the 161-year-old nurse of George Washington, it was, of course, “a patent lie.” He noted that whereas later editions of Barnum’s autobiography “describe the affair in apologetic terms, the original version seems playfully indifferent to issues of truth and falsehood” (p. xiv).

In his autobiography, Barnum wrote that he learned of Heth in the summer of 1835 and paid \$1,000 for her possession. Whalen attributed many factors to why thousands of people paid to see her, including the fact that she looked the part, as she was “withered, blind and toothless; she had also lost the use of most of her limbs” (2000, p. xiv). Newsom et al. noted that public interest in Heth began to die and letters were written to the editor under assumed names, debating her authenticity. Barnum didn’t care what the papers said, as long as he got space. Some practitioners today operate from a similar philosophy. They don’t care what kind of coverage their client gets as long as the client’s name is spelled correctly, an all-too-common philosophy of the press agent, especially in the entertainment industry.

When Heth died, an autopsy suggested her age to be about 80. According to Whalen, even after Heth’s death, Barnum continued to try to convince the public of her authenticity. He sent his associate, Levi Lyman, to James Gordon Bennett of the *New York Herald* with a different story. As, Whalen notes, “Barnum had decided it would be expedient to muddy the waters and reinforce the continuing public belief in Heth’s authenticity” (p. xv). Lyman told Bennett the autopsy itself had been a hoax and that Heth was alive and well in Connecticut. Bennett reacted as Barnum had

anticipated. Whalen notes, “Bennett, eager to scoop a rival paper, ran the story and attacked the autopsy results. He stood behind the story for a time, but much to his dismay, he soon realized the hoax was on him” (p. xv). But several months later, Barnum’s associate Levi Lyman appeared “contrite” and offered another “real” story to Bennett, who was convinced and, in a series of stories, offered a new “full and accurate account of the hoax” (Whalen, 2000, p. xv).

Whalen (2000) observed that “Barnum allowed this account to remain unchallenged until his autobiography, where like a triumphant serial hoaxer, he confessed to having duped Bennett a second (or third) time” (p. xvi). There was a reason why Barnum waited 20 years to write this. In Barnum’s words, “newspaper and social controversy on the subject (and seldom have vastly more important matters been so largely discussed) served my purpose as ‘a showman’ by keeping my name before the public” (1855/2000, p. 176).

Barnum’s last sentence of the Heth chapter in his autobiography claimed that “the remains of Joice were removed to Bethel, and buried respectably” (1855/2000, p. 176), but in his book, *P. T. Barnum: The Legend and the Man*, A. H. Saxon wrote that “there is no trace today of Joice Heth in Bethel” (1989, p. 74). Newsom et al. noted that Saxon too had been duped in regard to details about Heth’s life. The authors asked, “Was this true? Why not? After all, ‘there’s a sucker born every minute’” (Newsom et al., 2000, p. 38).

What’s interesting about this phrase, wrote Saxon in 1989, is that it is the one statement nearly everyone associates with Barnum, but in fact, it was never spoken or written by him. Saxon unravels the mystery this way: A tale was told by Joseph McCaddon, Bailey’s brother-in-law, who was in turn told by Captain Alexander Williams of the New York City Police Department that the expression was first used in the early 1880s by a notorious “confidence man” known to the police as “Paper Collar Joe.” His real name was Joseph Bes-simer. McCaddon reported the complete statement as being “There is a sucker born every minute, but none of them ever die” (Saxon, 1989, p. 336).

Whalen told the reader that the first six chapters of Barnum’s autobiography are about petty frauds and practical jokes that the people of Bethel, Connecticut (where Barnum was raised), inflicted

on each other. Chapter 7 included the Heth account. Whalen concluded that “Barnum’s stunning success derived from his unique ability to combine short-term sensations with a profitable, long-term strategy” (2000, p. xi), and that “although the individual scenes reek of scandal and low cunning, the narrative voice wins a measure of sympathy through frankness, audacity and irony” (2000, p. xii). Whalen observed that

in subsequent chapters, Barnum portrays himself in a more sympathetic light by showing how he occasionally gave the public its money’s worth. The second half of his autobiography includes extended accounts of Barnum’s three most “worthy” ventures: Tom Thumb, Jenny Lind and the American Museum. (2000, p. xix)

Charles Sherwood Stratton was a 4-year-old Connecticut boy whom Barnum named “General Tom Thumb.” Stratton was less than two feet tall and weighed less than 16 pounds, probably because of a condition called ateliotic dwarfism. Barnum realized the promotion possibilities with this midget were endless; he just needed to make it a really great story. In his autobiography, he writes that he upped Tom Thumb’s age to 11 to emphasize that he was “really a dwarf” (1855/2000, p. 244).

The case with opera singer Jenny Lind shows that perhaps Barnum was trying to control his exaggerations. Whalen stated that Barnum negotiated a contract with Lind and from September 1850 to June 1851, she was “at the center of a carefully orchestrated media storm, and she played to packed houses throughout the nation” (2000, p. xx). Barnum wrote in his autobiography,

I may as well here state, that although I relied prominently upon Jenny Lind’s reputation as a great musical *artiste*, I also took largely into my estimate of her success with all classes of the American public, her character for extraordinary benevolence and generosity. Without this peculiarity in her disposition, I never would have dared make the engagement. (1855/2000, p. 307)

Whalen had this to say about the one other example from later chapters in Barnum’s autobiography: “From Barnum’s perspective, old-fashioned morality was less important than professional

achievement, and thus is the story of his acquisition of the American Museum at the end of 1841” (2000, p. xxii). This event included what people of today might consider deception or false advertising, but Barnum perceived it differently.

Barnum hired a band to perform at the museum, free of charge to the public. But people who came to hear the free music got less than they bargained for—and on purpose. As cited in Whalen, Barnum wrote in the second version of his autobiography in 1869 (*Struggles and Triumphs: Or, Forty Years’ Recollection of P. T. Barnum, Written by Himself*),

I took pains to select and maintain the poorest band I could find—one whose discordant notes would drive the crowd into the Museum, out of earshot of my outside orchestra. Of course, the music was poor. When people expect to get “something for free” they are sure to be cheated and generally deserve to be. (2000, pp. 131–132)

Although these stories provide only a glimpse into the thought processes and dealings of P. T. Barnum, they send a message to public relations practitioners of today that distorting the facts for profitable gain at the expense of the public is not morally right or acceptable.

According to Stanley Baran, the time that the modern national political campaign was born (1896) is about the same time that public relations began to acquire its deceitful, huckster image. He concluded that “a disregard for the public and the willingness of public relations experts to serve the powerful fueled this view, but public relations began to establish itself as a profession during this time” (2001, p. 252). Some might argue that Barnum helped contribute to any misconceptions that the current practice of public relations is like his practice of press agentry.

The Public Relations Society of America (PRSA) was formed in 1947. Although this was a little too late for Barnum, one might wonder whether he would have belonged or would have simply formed his own society. The fact remains that the world is much different than it was in the 1800s. Even if the public is gullible, it is the job of the responsible and ethical practitioner to report only what is true.

In the year 2000, the PRSA board of directors introduced a dramatically revised Public Relations

Member Code of Ethics (available at www.prsa.org). Within the core values of the code is the following statement:

We adhere to the highest standards of accuracy and truth in advancing the interests of those we represent and in communicating with the public, we are accountable for our actions, and we are faithful to those we represent, while honoring our obligation to serve the public interest.

Is Barnum just the exception to the rule? Scott Cutlip, Alan Center, and Glen Broom offered the following interpretation of this phenomenon called P. T. Barnum:

Barnum's showmanship was evident not only in a canny instinct that enabled him to give the masses what they wanted, but also in his ability to dictate to them a desire for what he thought they should want. . . . Every man has his star. Barnum's star was an exclamation mark. (1999, p. 107)

BATEMAN, J. CARROLL

"I believe that public relations is a profession which should concern itself not with manipulation of people but with their continuing enlightenment" (Bateman, 1974, p. 6). So begins the credo that J. Carroll Bateman (1917–1982) wrote for public relations practice.

Bateman was a leader in public relations both nationally and internationally. He served as president of the Public Relations Society of America (PRSA) in 1967, presiding over the PRSA board meeting in Philadelphia when it voted to establish the Public Relations Student Society of America (PRSSA). The national case competition administered by PRSSA is named for him. He served as president of the International Public Relations Association (IPRA) in 1980. He devoted his last two years to public relations education after a long and distinguished career as a practitioner.

Born July 13, 1917, in Norwood, Pennsylvania, Bateman was raised in Baltimore, Maryland. He earned a bachelor's degree from Johns Hopkins University and a master's degree from New York University, where he wrote a thesis titled "Communications in Education." He was a reporter and feature writer for the *Baltimore Evening Sun* from 1934 to 1942 before becoming assistant editor of the Baltimore and Ohio Railroad's *B&O Magazine*. He served in the United States Army in World War II, returned to the B&O Railroad as public relations representative, and was promoted in 1951 to assistant director of public relations for the railroad. He joined the Eastern Railroad Presidents Conference in New York in 1953 as assistant chairman for public relations and advertising.

He served as public relations director of the Milk Industry Foundation in Washington, D.C., from 1955 to 1960. From 1960 to 1979, he functioned as general manager and president of the Insurance Information Institute, a public relations and public education organization supported by several hundred insurance companies in the property and liability field.

Bateman received numerous awards for his contributions to the field of public relations. He was named PR Professional of the Year by *Public Relations News* in 1973. He received the Gold Anvil Award from PRSA in 1975 for his contributions to the profession. During his tenure at the Insurance Information Institute, he received seven Silver Anvil Awards for outstanding public relations programs. He was editor and sole contributor to the *Public Relations Journal's* book review column. He was a frequent contributor to the *Public Relations Quarterly* and the *IPRA Review*, and he served in an editorial capacity with the *Public Relations Review*, *Public Relations News*, and *Journal of Commerce*. Bateman participated in several IPRA-sponsored World Congresses, serving as general chairman of the VII World Congress of Public Relations, which was held in Boston in 1976.

Bateman is revered in PRSSA history for his instrumental role in founding PRSSA during his presidency of the PRSA. He made education one of his initiatives in his term as president of PRSA in 1967. In his acceptance speech in November 1966, Bateman “stressed the advancement of education for public relations practitioners, one of the main goals of his regime” (Simon, 1968b, p. 30). In his inaugural speech as the new president of PRSA, Bateman “stressed his intention to underscore professional advancement through education as one of his chief goals” (Simon, 1967a, p. 37).

Bateman and two other representatives of PRSA met in August 1967 at the annual Association of Education in Journalism convention in Boulder, Colorado, to discuss “the desirability of establishing a single, nationwide student organization affiliated with the PRSA” (Simon, 1967c, p. 47). Formation of the student organization was approved by the PRSA Board in November 1967. It was expected that the first chapters would be activated by the end of the following spring term.

The PRSA Board of Directors on April 4, 1968, “gave formal approval to the formation of nine

chapters of the newly organized PRSSA.” The board decision established “the first professional public relations oriented student organization in America sponsored by a national association of public relations practitioners” (Simon, 1968b, p. 30). The first chapters were at San Jose State College, The Ohio State University, University of Maryland, University of Texas, University of Florida, University of Houston, University of South Carolina, Utica College of Syracuse, and West Virginia University. Additional student chapters were established by the end of the year.

In the words of Dr. Frederick Teahan of PRSA’s headquarters, the purpose of the student organization was to

cultivate a favorable and mutually advantageous relationship between students and professional public relations practitioners, foster students’ understanding of current theories and procedures . . . and make evident and desirable membership in the PRSA—when the student subsequently becomes eligible. (Simon, 1968a, p. 31)

In 1981, when Betsy Plank and Jon Riffel founded the informal organization Friends of PRSSA (now known as Champions of PRSSA), Bateman became a charter member.

Bateman represented PRSA on the American Council on Education for Journalism after PRSA became an active participant in the American Council for Education in Journalism (ACEJ) in 1968. He represented PRSA on ACEJ for 11 years and was a member of more than 20 accrediting visits for public relations curriculum sequences across the country.

From 1973 to 1974, Bateman served as cochair of the Commission on Public Relations Education and was coauthor with Scott Cutlip of the commission’s report titled “A Design for Public Relations Education.” The Bateman–Cutlip report was considered “a very valuable contribution on the subject of public relations education” (Karl, 1980, p. 62).

A National Case Study competition was established by PRSA in 1973 to allow students in PRSSA to have an opportunity to exercise the analytical skills and mature judgment required for public relations problem solving. Following his death, the name of the competition was changed to honor Bateman in 1983.

In September 1980, Bateman joined the public relations faculty at the University of Tennessee to provide leadership in the public relations sequence. He taught courses in public relations management and public relations cases, advised the University of Tennessee chapter of PRSSA, organized a student-run public relations firm, planned the university's first PR Day, participated in the university's College of Business Administration's Executive-on-Campus program, and convinced the PRSA's board to bring its annual Institute to East Tennessee during the 1982 World's Fair.

After his first quarter of teaching, his doctor warned him of congestive heart failure, urging him to slow down. Bateman wrote to his department head, "My own inclination is to keep going" (Bateman, 1981, n.p.). At age 64, Bateman died suddenly from a heart attack on April 24, 1982. He had participated in the University of Tennessee's second PR Day the previous week. He was survived by his wife of 42 years, Marguerite, a daughter, Carol Anne, and a son, Walter Raymond.

An editorial in the University of Tennessee's student newspaper, *The Daily Beacon*, observed, "Students Lose a Friend." The *Public Relations Journal* devoted a full page to honor his memory in May 1982. He had figured prominently in the 34th national convention of PRSA in November 1981, serving on a panel discussion.

"Carroll was never really satisfied with the status quo of his chosen profession," said longtime friend and public relations colleague Herbert B. Bain, speaking at Bateman's memorial service in April 1982 in Butler, New Jersey. "He always wanted to know more about it, to find better ways of doing things. He continued his university studies at night school and received his master's degree. He wrote articles and books on public relations." Bain acknowledged Bateman's numerous professional recognitions, "and rightly so. For no one ever did more to turn this vocation of PR into a real profession than did J. C. Bateman."

The following version of his credo concluded his remarks to the American Assembly of Collegiate Schools of Businesses, April 25, 1974:

I believe that public relations is a profession which should concern itself not with manipulation of people but with their continuing enlightenment;

I believe that public relations practice should strive to elevate its audiences rather than to degrade them, and that communications should be addressed to reason and judgment rather than to emotion and prejudice;

I believe that sound public relations comprises policies and deeds as well as words; that it should deal in truth rather than deception; and that it should seek to clarify the issues of our times rather than to confuse them;

While I may undertake to present one side of an issue for public consideration, I believe in the right of those with opposing points of view to present their case also;

I believe that the public interest takes precedence over the interests of those I represent; and I conceive of my functions as being to assist in conforming the interests of those I represent to the interests of the public when the two do not coincide;

I recognize that the consequences of my actions are effected in the minds of men; and because the human mind has unmeasurable potentials for good and evil, I should approach my task with overriding respect for the right of the individual to make his own judgments. (Bateman, 1974, n.p.)

BATTLE OF THE CURRENTS

One of the most dramatic exchanges in the history of public relations is the “battle of the currents,” a competition started in the late 1880s that sought to determine whether direct current (DC) or alternating current (AC) would become the industry standard for electricity delivery. Specifically, the battle pitted Thomas Edison and the General Electric Corporation against Nikola Tesla, who was backed by George Westinghouse of the Westinghouse Corporation. The exchange is significant in that it is paradigmatic of the personal, political, economic, and public relations battles that occur as new technology matures to the point where one form of technology becomes the industry standard at the expense of another.

Alternating Current Versus Direct Current

On one level, the battle between alternating current and direct current was a straightforward technical question. Direct current is the more simple and uncomplicated form of current. In it, current flows in one direction, such as in a flashlight, where it flows from the batteries to the light. In the battle of the currents, direct current was developed

first and was already on the market—with stations in Manhattan and in other major cities—when alternating current appeared. In Edison’s day, direct current required the construction of a power station every mile or two because direct current degraded as it was transmitted down a power line.

Alternating current is much more complex. Current moves not in one direction, but in both directions, alternating approximately 60 times every second. At the time, unlike direct current alternating current was shown to be able to travel large distances with increasing success, which would allow for the development of fewer and hence more cost-effective power stations. Two other advantages stood out for the selection of alternating current: One, it could easily be sent through narrow copper wire, unlike direct current, which at the time needed larger wire; and two, it could be “stepped up” to high velocity, which enabled large volumes to be transmitted over high tension wires and then “stepped down” to low velocity for use in individual homes and applications.

Clearly alternating current enjoyed a technical advantage over direct current. But Edison had “gotten there first” and believed that he had spent too much money developing direct current to abandon it, even at the urging of some of his fellow colleagues at Menlo Park. After 11 patent infringement lawsuits against Westinghouse failed, Edison decided to go public. Such a decision led to the battle of the currents.

The Battle Is Joined

The battle, depending on one’s perspective, shows public relations at its most innovative and creative, or at its most desperate. As General Electric began to witness the development and popular acceptance of alternating current, Edison and his colleagues went on the offensive with the assistance of his secretary, Samuel Insull. In particular, they claimed that alternating current was unsafe (though ironically, direct current was responsible for the death of 400 people in the great blizzard of March 1888). Indeed, they published a bright red pamphlet, titled “A Warning From the Edison Electric Light Company,” which purported to explain the dangers of alternating current. Harold Passer (1953) wrote,

The Edison viewpoint was that alternating current endangered the lives of all members of a community where it was present. . . . The strategy of the Edison Company was to educate public opinion to the view that AC was an intolerable menace to the American people, fostered upon it by a selfish and profit seeking corporation. (p. 168)

In addition to the arguments against the AC format, the book contained an appendix that listed the names of those killed by alternating current.

Much of the strategy was conducted through the media-savvy Edison and his team. Most of their efforts focused on the supposed danger surrounding alternating current. In 1887, at his Menlo Park laboratory, Matthew Josephson wrote that “in the presence of newspaper reporters and other invited guests, Edison and Batchelor [an associate] would edge a little dog onto a sheet of tin to which were attached wires from an AC generator supplying current at 1,000 volts” (1959, p. 347). The implication, of course, was that alternating power was dangerous. And the fact that members of Edison’s team used the term “Westinghoused” when referring to the act of killing the dogs did not hurt either.

In recounting the efforts by Edison against Tesla and Westinghouse, George Westinghouse noted some of the stunts used by Edison:

I remember Tom [Edison] telling them that direct current was like a river flowing peacefully to the sea, while alternating current was like a torrent rushing violently over a precipice. Imagine that! Why they even had a professor named Harold Brown who went around talking to audiences . . . and electrocuting dogs and old horses right on stage, to show how dangerous alternating current was. (Tesla, 2003, n.p.)

Perhaps the lowest moment of Edison’s storied career came during the battle of the currents. In an effort to show that alternating current was dangerous, he engaged in a subtle, behind-the-scenes effort to get the State of New York to use alternating current to execute a criminal. Although Edison’s involvement in the effort was originally thought to be limited, recent works show that he played a more direct role in its development. The primary electrician was the aforementioned Harold Brown, who led the push for the electric chair

until it was adopted in 1888. When the first criminal, William Kemmler, a fellow from Buffalo who had killed his paramour, Matilda “Tillie” Ziegler, was executed on August 6, 1890, the electrocution required two different jolts of 1,300-volt alternating current; the first lasted 17 seconds, and the second took more than a minute. Indeed, after seeing it, some suggested that hanging was a much more humane way to execute criminals. One newspaper ran the headline “Kemmler Westinghoused.” Richard Moran hypothesized that Edison bribed a reporter to run the story and headline (2002).

Although Edison was offensive and relentless in his efforts to promote direct current at the expense of alternating current, the Westinghouse Corporation was slow to respond and, in its efforts, emphasized the technical superiority of alternating current over direct current. Indeed, H. C. Passer asserted that by the summer of 1888, Westinghouse realized that Edison’s efforts were starting to be effective with a public that knew little about electricity. As a result, the Westinghouse Company finally came out with a booklet in October 1889 titled “Safety of the Alternating System of Electrical Distribution,” which hailed the benefits and safety of this form of electrical distribution. George Westinghouse also went one step further and hired a newspaperman, Ernest H. Heinrichs, a reporter who worked for the *Pittsburgh Chronicle Telegraph*, to tell the AC side of the story. In his charge, Westinghouse stated that he wanted to use advertising to correct the negative perception of the safety of alternating current and to rebut inaccurate accounts. Scott Cutlip wrote that Heinrichs led the public relations campaign for Westinghouse by “ghosting a reply to articles by Edison and Brown that had been published in the *North American Review*” (1995, p. 203), which refuted the claims against alternating current. Indeed, research suggests that it took approximately three years of consistent advertising and communication for alternating current to begin to be recognized for its safety and advantages and for it to become adopted as the standard by many municipalities.

Most consider that the battle of the currents was not completely finished until the successful completion of two events. The first was the choice of alternating current to power the 1893 Chicago World’s Fair; this was the first all-electric World’s Fair in history. From then on, 80% of all electrical

devices ordered were for alternating current. The second was the development of hydroelectric power in the late 1890s at Niagara Falls. The consortium that developed the falls included both Westinghouse and General Electric; it chose the alternating current system to deliver electricity throughout the region.

BEAT

A beat is the specific assignment filled by a reporter. Each beat is a topic area, usually relating to some aspect of newspaper, television, or radio news. Until recently, the news tradition relied on beat assignments as a means for increasing the expertise and newsgathering ability of key reporters.

Typical beats might include city hall, police, entertainment, finance, social scenes, religion, education, fashion, and sports. Periodically, news organizations have environmental quality and consumer protection beats. Certain news organizations have national and international beats. They might have state capitol, Washington, D.C., or Middle East beats.

By dividing reporters by beats, news organizations can be sure that they cover the important topics, groups, and institutions within their community where news is likely to occur. Once beats are established, reporters are assigned to cover them. This increases the likelihood that the news organization will know what is going on over the full range of news.

Beats add depth to coverage and provide practitioners with predictable opportunities for specific photo-ops. Each reporter can become an expert on the events, people, opinions, and issues relevant to a beat. The dynamics of a community's social scene (society page beat), for example, are quite different—even if interdependent at times—from the city hall beat. Which socialite is hosting which nonprofit event is different from what member of city council is fighting for or against some measure pending before the council. Financial reporting on business trends, economic forces, and publicly traded companies takes special knowledge and insights that differ from sports reporting. Sports reporters need to know the ERAs (earned run averages) of the baseball leagues' pitchers. Financial beat reporters need to know about IRAs (individual retirement accounts).

Just as beats are important for news organizations, they have a parallel importance for public relations. If a publicly held company is hosting a golf tournament, that is sports news, and it is financial news. In the sports page, the company wants its name mentioned as often as possible because that gives it name recognition and brand equity with customers. On the financial section, it wants to be seen as a company that knows how to gain name recognition and sell products. Such an event might make the social page if the CEO gives a large check to some charity. That news also can help drive sales and might attract investors.

Traditionally, the savvy public relations practitioner knows the reporters on each beat who are relevant to his or her practice. Mutually beneficial relationships can develop between reporters and practitioners.

Today, major changes are occurring in the nature of beat. New media, social media, blogging, and many other trends are eroding the universal sense of beat. A reporter is likely to get pictures and even text that originated in a viewer's or reader's cell phone. As newsroom populations are reduced,

more and more newsgathering is derivative of other media sources and lay publics in ways that are blurring the beat tradition.

BENCHMARKING

Benchmarking is the process of creating points or measures against which a public relations campaign can be evaluated. Quite simply, without some form of benchmark, evaluating public relations is not possible. A benchmark, then, is some outcome used to measure a current campaign. For example, businesses and corporations often benchmark quarters and compare how sales, unit production, and shares compare against the previous quarter, or perhaps the same quarter from 2 years earlier.

All public relations campaigns need a benchmark in order to judge progress or against which decisions are made regarding alternate tactics. In most public relations campaigns, there are three separate campaign phases: The *developmental phase* is the planning process of the campaign, where specific benchmarks are established. The *refinement phase* occurs when the campaign is actually underway, and during this phase measurements are taken and compared against the identified benchmarks. The *evaluation phase* occurs when the campaign has been completed and results are compared against initial benchmarks.

Benchmark Objectives

Benchmarks are established based on the campaign's goals and objectives. A *goal* is the campaign's general expected outcome. *Objectives* are specific outputs employed tactically to obtain certain outcomes. For example, a goal may be to increase awareness of a corporation's philanthropy. The goal may be obtained through the use of press releases, brochures, articles in magazines, and so forth. The use of the various media is part of the objective—to increase awareness through these outputs—to achieve an outcome. The outcome

must be measurable, must be tied to the goal, and must clearly come from the outputs. The objectives are then evaluated against the established benchmarks for the campaign.

Unlike many business objectives, which are almost always based on financial or physical objects, a public relations objective often is more abstract. Thus, public relations objectives and their benchmarks are typically of three types: informational, motivational, and behavioral. *Informational benchmarks* set the mark for how much information is getting out in the campaign. *Motivational benchmarks* establish what that information has done regarding attitudes toward the campaign objective. *Behavioral benchmarks* establish whether the target audience is reacting the way the campaign intended. Finally, there is the ultimate evaluation, where the actual behavior desired either occurs at the level expected or does not.

In our business awareness example, benchmarks are created during the campaign's developmental phase to be used both in evaluating the campaign's progress toward meeting its goal and to determine whether the specific informational, motivational, and behavioral objectives are being met. Developmental benchmarks are often obtained from historical and secondary data. These may come from previous campaigns or may be found in industry-wide or media-related publications. For instance, suppose the company had conducted a similar campaign five years earlier. Use of the results from that campaign could be used as a benchmark against which to evaluate the new campaign. On the other hand, a survey may have been conducted that indicated an awareness problem, and the results can be used as the benchmark against which the campaign is evaluated during the refinement and evaluation phases. The survey (or focus group or interview data) is considered primary data—data gathered by the company itself just prior to the developmental phase or as a part of the developmental phase. Thus, developmental benchmarks might consist of attitude surveys (primary data) or secondary data. Secondary data, for instance, are gathered from other sources that indicate how aware key customers are of the company, its products, or its services. Primary and secondary data can be used in combination.

What is important is that the benchmarks are something the campaign can evaluate against

during its implementation. Developmental benchmarks provide data as to whether the campaign is progressing effectively in terms of messages received and understood, whether those messages are motivating the target audience as intended, and whether the target audience engages in the desired behaviors.

Refinement benchmarks should be established across the campaign timeline to indicate whether the campaign is working as expected. Refinement benchmarks can help to determine whether outputs are received, and if they are, whether they are motivating the target public as expected. Good refinement benchmarks typically follow this type of form of strategic planning: “by such and such a date, outcome should be X as compared to the initial baseline.” These benchmarks are extremely important and not only provide a measure of effectiveness but also can pinpoint errors in campaign logic. The ability of a campaign to determine whether certain outputs are working or require a tactics change may well be the difference between the final success or failure of a campaign.

Final evaluation benchmarks are found in the closing stages of the campaign. These benchmarks are set as close to the campaign goals as possible. Thus, final evaluation benchmarks are used to gauge whether the campaign’s tactics meet a projected goal or whether that goal should be reconsidered, the campaign revised or extended, or both. These benchmarks should clearly indicate behavioral intentions—in our example, that people will (1) have increased awareness of the company and (2) will use that awareness to do something that impacts positively on the company. Thus, final surveys or focus groups assess whether the company’s awareness has changed (hopefully for the better) and what that change may yield in terms of business objectives—again, typically financial or production-oriented.

Benchmarking provides the public relations practitioner with information as to why a campaign accomplished what it did and the logic to explain its outcome to clients. A campaign that has no benchmarks cannot provide a client with a clear-cut and empirically related rationale for why something worked (or often more importantly, why it did not work). It does not help if a target audience approached the campaign goal, but the practitioner was unable to show how that outcome was obtained; communication and psychological researchers have found

that if someone engages in an action and does not know why they engaged in it, then it is doubtful that they will repeat the action a second time. Carefully selected benchmarks provide the data that show that a campaign’s information was received, interpreted, and motivated the target audience to do what the campaign intended. They can also show where campaign tactics fell short, where they require reevaluation, or whether they were applied in an appropriate manner.

Without benchmarking, the public relations campaign is not measurable. Benchmarks provide the data points necessary to evaluate the campaign—both during the campaign (and thus providing evaluation points from which tactical change can be incorporated) and at the campaign’s end. Benchmarking should be employed in all types of public relations campaigns regardless of the campaign’s goal: whether to win an election, to manage a crisis, or to promote a product or personality.

BERNAYS, EDWARD

Edward L. Bernays was one of the founding fathers of public relations. He invented the name for the emerging profession in 1920. In 1923, he taught the first course in public relations at New York University; he wrote the first book—*Crystallizing Public Opinion*—on public relations; he published the

first article on public relations in an academic journal—“Manipulating Public Opinion: The Why and the How”; and he published in *The American Journal of Sociology*—the same year. He concluded that article with the following paragraph:

This is an age of mass production. In the mass production of materials a broad technique has been developed and applied to their distribution. In this age, too, there must be a technique for the mass distribution of ideas. Public opinion can be moved, directed, and formed by such a technique. But at the core of this great heterogeneous body of public opinion is a tenacious will to live, to progress, to move in the direction of ultimate social and individual benefit. He who seeks to manipulate public opinion must always heed it. (Bernays, 1928a, p. 971)

He saw a broader social mission for the new social technology in a pluralist society. He defined it very simply: “Public relations means exactly what it says, relations of an organization, individual, idea, whatever, with the publics on which it depends for its existence” (Bernays, 1986, p. 35). For that reason, “Public relations counsel functions on a two way street. He interprets public to the client and client to public” (Bernays, 1986, pp. 35–36). Bernays envisioned public relations as a profession: “By definition, profession is an art applied to a science, in which the primary consideration is public interest, not pecuniary motivation” (Bernays, 1986, p. 36). Although his 1998 biography by Lary Tye is entitled *The Father of Spin: Edward L. Bernays & the Birth of Public Relations*, Bernays was an articulate opponent of “image making” (Bernays, 1986, p. 53):

The interest of both public and profession demands that the word “image” referring to public relations be eliminated. Practitioners should cease use of the word to describe their activities. The word “image” makes the reader or listener believe public relations deals with shadows and illusions. This word belittles a profession dealing with hard facts of behavior, attitudes and actions, that requires ability to evaluate public opinion and advise clients or employers on how to adjust to gain socially acceptable goals and to inform and persuade the public. (Bernays, 1986, pp. 54–55)

On p. 67, this argument is repeated in a short statement: “Public relations deals primarily with advice on action, based on social responsibility” (Bernays, 1986). For that reason he was a promoter of public relations research, education, and licensing. He saw public relations as being a social technology that can be used for either good or bad purposes—and as such in need of regulation.

Edward Bernays was born in 1891 in Vienna, Austria, and celebrated his first birthday on board the ship where his parents immigrated to the United States. He was a double nephew of Sigmund Freud (his father Eli Bernays was married to Ana Freud, sister of Sigmund Freud, the founder of psychoanalysis; Sigmund Freud was married to Eli’s sister, Martha Bernays). After graduating from Cornell University, in 1913 he traveled to Europe to meet his famous uncle. When back in the United States, Bernays corresponded with Freud and helped him with translations of his works from German into English. James E. Grunig and Todd Hunt wrote that it was because of his relations with Freud that Bernays became interested in social sciences and that he was probably the first “intellectual” in the public relations profession (Grunig & Hunt, 1984, p. 77). This is how Bernays saw his work:

Public relations counsel . . . functions primarily as an adviser to his client, very much as a lawyer does. . . . His first efforts are, naturally, devoted to analyzing his client’s problems and making sure that what he has to offer the public is something which the public accepts or can be brought to accept. It is futile to attempt to sell an idea or to prepare the ground for a product that is basically unsound. . . . His next effort is to analyze his public. He studies the groups which must be reached, and the leaders through whom he may approach these groups. Social groups, economic groups, geographical groups, age groups, doctrinal groups, language groups, cultural groups, all these represent the division through which, on behalf of his client, he may talk to the public. . . . Only after this double analysis has been made and the results collated, has the time come for the next step, the formulation of policies governing the general practice, procedure and habits of the client in all those aspects in which he comes in contact with the public. And only when these policies have been agreed upon is it time for the fourth step. (1928b, pp. 38–41)

This fourth step is implementation, or execution of public relations programs. It is here when discussing implementation that Bernays, in the contemporary literature, achieves nearly mythical powers and becomes everything he was fighting against: Stuart Ewen put Edward Bernays in the very center of his *PR! A Social History of Spin* in 1996, while Tye named Bernays the father of spin in his 1998 book. Bernays himself contributed to this mythology when he published his 1962 autobiography three years after retiring and listed 229 of the most important clients he had served, among them: American Tobacco, Bank of America, CBS, General Electric, General Motors, Proctor & Gamble, United Fruit, Westinghouse, and more.

The most articulate criticism of Edward Bernays's work was published by Marvin Olasky in 1987. He wrote,

Bernays is known to some historians for naming the field that he would influence so heavily. In 1922, while Ivy Lee was still referring to himself as a publicity advisor, publicity expert, or publicity director, Bernays was describing himself as a public-relations counsel, and that is the title that caught on. . . . But Bernays did something more important: He gave public relations practitioners pride in their activities. . . . He was able to do so because of his communication skills and a personal belief-structure made up of atheism, Freudianism, and a faith that behind-the-scenes controllers should exercise "social responsibility" by devising clever public relations campaigns to direct "human herds" into appropriate corrals. (1987, p. 80)

Although Ewen's 1996 criticism of Bernays, his work, and his writing came from the left side of a political spectrum, Olasky's criticism is from the political right; Bernays became a symbolic figure for everything to be censured in contemporary public relations, and it is very interesting to see that the U.S. public relations community, academic and practitioner alike, is uncomfortable dealing with Bernays. Yet, if public relations is ever to get widespread recognition for doing something socially valuable, it can achieve this only by confronting Bernays and his legacy.

Bernays said in his 1955 article "The Theory and Practice of Public Relations: A Resume" that

public relations is the attempt, by information, persuasion, and adjustment, to engineer public support for an activity, cause, movement, or institution. . . . Professionally, its activities are planned and executed by trained practitioners in accordance with scientific principles based on the findings of social sciences. The dispassionate approach and methods may be likened to those of the engineering professionals which stem from the physical sciences. (1955a, pp. 3–4)

Modernist and positivist approaches to social research and education that are explicit in Bernays's definition of public relations are no longer as popular at the beginning of the 21st century as they used to be in the middle of the 20th century. However, the use of public relations as social technology based on scientific research and education will become ever more present as cohorts of undergraduate and graduate students in public relations from universities around the world enter the market. Bernays's life spanned over a century, but his time is yet to come; public relations has yet to become an art applied to science.

BEST PRACTICES

Best practices are methods or techniques that can be applied reliably in public relations with assurance that such approaches consistently will yield the most effective, responsible, and ethical performance and results. Robert L. Heath (2001) noted that the theme of best practices drives the discipline since the field's professional and academic literature so often addresses the central question: How can public relations practice be improved to increase practitioners' abilities to influence desirable outcomes benefiting the organizations they are serving? Like every other human endeavor, public relations involves probabilities; best practices serve to enhance the probabilities that professionals' endeavors will be successful.

Best practices emerge from the experiences and judgments of leading practitioners, or they may be derived from theory building and academic research. Best practices may be defined, tested, and refined by practitioners and academics alike; in fact, it may well be that during this quest to identify best practices, practitioners and academics are most likely to meet and complement one another. Some suggest that when the reality that public relations is a practical applied discipline is disregarded, the research and theory building of the field may then risk becoming dysfunctional (Heath, 2001).

The fact that myriad options exist in public relations makes identifying reliable best practices daunting. Edward Bernays (1965) wrote in his memoirs

that he had once thought the practice of public relations could be modeled after the practice of law; that public relations could be codified and, just as with law, practiced after precedents were established, applied, and followed. However, Bernays gave up the notion of public relations practice-by-precedent because he found there are simply too many variables to be accounted for in public relations practice, which is further complicated by the fact that the variables so often are constantly changing. Bernays's assessment that public relations is too complicated to be practiced by precedent has implications for best practices. While it is clear that there *are* best practices for given situations in public relations, determining *what* the best practice is in a *particular* situation can be challenging.

Benchmarking is a necessary condition for practices to become "best," because without measurement and evaluation pre- and post-application, a method or technique cannot be judged superior with confidence; benchmarking also clarifies when best practices evolve and become better. In *Crystallizing Public Opinion*, Bernays portrayed public relations as an applied social science to be planned and precisely measured through research. However, Tom Watson (2012) pointed out the irony that there is "little discussion" of measurement and evaluation in Bernays's books and papers (p. 391). By the late 1970s, knowledge gaps in public relations practice were being identified by Mark McElreath and colleagues, along with laments by James Grunig and others that practitioners were not benchmarking adequately. By the 1990s, some gaps in the field's knowledge were being filled by numerous scholars.

Yet, because many researchers have found that "practitioners still talk more about evaluation than actually practice it" (Watson, 2012, p. 396), as organizations increasingly demand documentation of return on investment, identification of best practices in public relations will accelerate. A good predictor was the adoption of the Barcelona Declaration of Measurement Principles at the 2010 European Measurement Summit; it has been widely embraced by professional and academic associations in North America, such as the Institute for Public Relations (IPR), the Public Relations Society of America (PRSA), and others.

Most agree that public relations constitutes a process. Contemplating public relations practice, Kirk

Hallahan (1993) identified seven paradigmatic models of processes presently used in practice. These include (1) the *four-step process model* (research-action-planning-evaluation), which Hallahan viewed as the default paradigm conceptualizing public relations as an ongoing set of routinized activities without time frames; (2) *plan or program paradigm* focusing on planned or programmed strategies and tactics; (3) *communication/practice style paradigm* focusing on communications produced regardless of process or plan; (4) *organizational/managerial effectiveness paradigm* emphasizing developing effective relationships with the organization represented and meeting of organizational expectations; (5) *behavioral paradigm* stressing the achievement of intended behavioral outcomes among publics; (6) *social problems paradigm* focusing on public relations' response to political or sociological problems and/or opportunities and how practitioners deal with power relationships in society; and (7) *systems paradigm* emphasizing internal and external inputs and communication and action outputs designed to reduce conflict and build consensus between an organization and its publics.

Hallahan noted that none of these provides a unifying framework for the field let alone a fully satisfactory overview of the field. He also pointed out that evaluations for each of the process paradigms is different—for example, the four-step process paradigm evaluation answers the question, “Were all the steps of the process followed?” whereas the plan/program paradigm evaluation answers, “Was the campaign well executed in terms of objectives, strategies, tactics, within budget, etc.?” and for the systems paradigm, “Was equilibrium maintained?”

Which of these—or any other—paradigms is the best practice in a particular public relations application depends on a variety of variables, beginning perhaps with the worldviews of key participants making the public relations decisions. For example, in 1992, Elizabeth L. Toth identified the rhetorical, critical, and systems (or excellence) paradigms as the three major ones. Nearly 20 years later, she called her three-paradigm view “overly simplistic,” and pointed to “at least six . . . in alphabetical order, so as not to suggest any hierarchy”; they are crisis communication, critical theory, feminist theory, rhetorical theory, strategic management theory, and tactical communication theories, including

campaigns (Toth, 2010, p. 714). Other scholars cite additional paradigms, a position with which Toth agrees, because “each one has a different conceptual foci and contributes different knowledge to our understanding of public relations” (p. 714).

No single source summarizes all of the best practices in public relations. It is doubtful that practitioners and scholars would agree on a uniform “code” of best practices, at least in part due to the situational variability that characterizes the field. Certainly, best practices in public relations have evolved over time and will continue to evolve along with the ever-changing field and as a product of both applied and academic theory-based research.

The good news is there are a multitude of resources for practitioners and scholars to create their own individual compendiums of best practices to guide their individual work. For example, there are numerous textbooks about public relations. Three examples are *Cutlip & Center's Effective Public Relations* (Broom, 2009); *Public Relations: The Profession and the Practice* (Lattimore, Baskin, Heian, & Toth, 2012); and *Public Relations: Strategies and Tactics* (Wilcox & Cameron, 2012)—although none of these three textbooks index the words “best practices,” all dedicate themselves to summarizing many best practices. *Public Relations: A Values-Driven Approach* (Guth & Marsh, 2012) references “Best Practices in Corporate Communications” on page 170 with a quotation about a recent National Ethics Survey of U.S. companies and values statements from Shane McLaughlin of the Best Practices in Corporate Communications organization. Other recent books about the field cover best practices. For example, *Handbook of Public Relations* (Heath, 2000) has 24 chapters under the heading “The Practice of Public Relations as Change Management” covering best-practice topics, such as use of research, reputation and issues management, risk and crisis communication, relationship building, leadership, ethics, and other specialties “in context,” such as health care, sports public relations, and investor relations.

Academic journals, such as *Journal of Public Relations Research*, *Journal of Communication Management*, *Management Communication Quarterly*, and *Public Relations Review*, all publish content and references concerning best practices; many of these have a theoretic grounding or

framework. The professional press, such as *PR Tactics*, *PR Week*, *Inside PR*, *Public Relations Quarterly*, and *Communication Briefings* among many other titles, frequently offer information about best practices, sometimes featuring case studies; many of them, such as *Bulldog Reporter*, have launched really simple syndicator (RSS) feeds with near daily postings, and some periodically offer webinars, as does the Public Relations Society of America. In addition, PRSA has launched a new online academic-professional *Public Relations Journal* and continues to offer resources through its Professional Resources Center; the IPR also posts a great deal of best practice information on its website. In-person continuing education professional development seminars and workshops offered by the International Association of Business Communicators, PRSA, and other national and regional professional organizations as well as their local chapters typically highlight best practices.

Finally, as this second edition of the *Encyclopedia of Public Relations* is being compiled, to test the best practice of search engine optimization (SEO), a September 26, 2012, Google search of “Best Practices in Public Relations” yielded “about” 13 million results in 17 seconds. Leading the results was a 272-page pdf file titled “Firm Voice: Outstanding Best Practices for Public Relations Firms” (Council of Public Relations Firms, 2009). The fourth result was an article titled “The Application of ‘Best Practices’ in Public Relations Measurement and Evaluation Systems” from the first issue of *Public Relations Journal* (Michaelson & Macleod, 2007), and the seventh was a PowerPoint file by Michaelson about best practices in public relations research archived on the IPR website. The other page-one results consisted of various blog entries posted to commercial websites and RSS feeds or on practitioners’ individual blogsites or websites to promote their services.

These are just a few sources of information about best practices available. A long-awaited update to the *Public Relations Body of Knowledge*, PRSA’s attempt to codify the field’s knowledge about best practices—a necessary condition for any occupation to be considered a profession—began but was quickly abandoned in the early 2000s. With the array of research being conducted and information about best practices available in one form or another, it was impossible to marshal

the resources required to complete the update, let alone to simply keep up in the future.

BILL STUFFER

Bill stuffers are one of many public relations tools used to reach targeted audiences. They are especially available for utility companies and other business types that send out periodic billing statements. They are also used by nonprofits, especially activists who know that their mailing lists contain the names of people who are likely to be motivated to take specific actions.

Each month or on some other occasion, thousands of bills are mailed to customers and donors across the nation. Anyone who receives such bills often is aware of the “clutter” of stuff that accompanies the bill. Certain organizations also take these opportunities to communicate with their customers or donors. Today, as well, such stuffers can accompany online monthly bills. Ironically, they seem less like clutter when accompanying a bill, but they also can link to other communication sites.

Bill stuffers can contain information that actually is of value to many patrons. For instance, a utility company might suggest ways its customers can reduce their heating and cooling bills. For these companies, such bill stuffers can be part of their customer relations programs. Activist groups might use billing stuffers to profile the plight of

some group of individuals in society, the need for increased funding, and even legislative initiatives that are favored or opposed by the sponsor who mailed the bill stuffer.

These tools can also be used to shape opinions and motivate the targeted audience. They can suggest that some opinion would be in the best interest of their targets. Insurance companies, as an example, might call their customers’ attention to legislation or regulation that might raise—or lower—insurance rates. Activists, for instance, might indicate how research has discovered an association between a product’s design and consumer health. Utility companies often use bill stuffers to justify support or opposition of some legislation or regulation.

It is easy to imagine that many bill stuffers go unread. Customers and donors have to sort through the clutter accompanying bills to find the message. They may be focused on other tasks, such as paying bills rather than responding to appeals or seeking information. At best, the stuffers reach only persons who are already cognitively involved with some issues. These people might be opinion leaders who pass information, evaluation, and advice to others.

Although such communication tools might be inefficient or ineffective because of the few people they reach—the ones who actually read and respond—they are at the vortex of controversies. One example of such a controversy was during the era of antinuclear plant construction activism. Some electric generating utility companies that wanted to build and operate nuclear generating facilities included pronuclear messages on their bill stuffers. Antinuclear activists argued that this use of message delivery unfairly privileged the utility companies, who could easily reach their customers each month.

Various regulatory agencies have reviewed the use of bill stuffers. Typically, the Supreme Court has ruled that these tools are not a form of regulated or prohibited communication, if they serve a larger public interest beyond the narrow commercial interest of the sponsor. Because of their usefulness and targetability, they have become well established tools of integrated marketing communication that are especially useful for publicity and promotion.

BIO

Bio is the abbreviation for *biography*. Bios are the life sketches of individuals who represent an organization or business entity. Although bios do not provide the entire life story of a member or leader of an organization or company, they do contain information about a person that establishes their qualifications and experience and as someone bringing credibility to the organization or company.

Items to include in bios are a person's educational background; previous places of employment, with emphasis on management positions held; and awards, achievements, and professional recognitions received. A limited amount of personal data also may be included, such as spouse and children's names, as well as community involvements.

Bios are almost always included as a component of media kits. When a company or organization distributes a media kit, bios of the top executives should be included, along with other background information about the organization. Bios also may be included with a press release, especially if it is an announcement of a promotion within a company, organization, or public relations agency. Depending on whether the press release is emailed or sent by hard copy, headshots of the newsmakers should also be included, preferably in color fit to print. If only black and white photos are available, a note should be included that indicates when color photos will be ready.

Bios also are useful to have available for each member of an organizational team and also for each member of an organization's board of directors. Depending on the organization, bios may appear on websites to familiarize key publics with those that are serving them.

Most often, public relations practitioners are responsible for compiling bios and ensuring that they are kept current. Having bios available only makes the public relations practitioner's job easier, as the content may be used in internal news publications, brochures, and other items.

Credentials contained within bios are crucial for providing credibility for an organization's message. For example, sources with biochemistry degrees speaking about the effects of harmful radiation are viewed as more credible than sources with world

history degrees. Both degrees are meaningful, but biochemistry is more relative to the issue at hand.

Having bios readily available also enhances the public relations practitioner's credibility with the media. When a reporter needs background information immediately for a breaking story, not having to wait for the public relations department to produce it lends credibility to the organization.

Bios most often are written in the third person. They should also avoid editorializing. They should appear on company letterhead but without the contact information that would appear in a press release.

BLACK/DARK WEBSITE

A black or dark website is a dedicated set of web pages that provides critical information to key publics during an emergency or an event that disrupts an organization's operations. As a major crisis communications tool, dark websites are developed in anticipation of events but remain "dark" or "black" until they are needed and can be activated quickly and easily.

Various organizations develop contingency plans for how they will respond to incidents that are likely to occur or that might make them vulnerable. Examples include natural disasters, airline crashes, chemical explosions, oil spills, and outbreaks of infectious diseases. Dark websites can explain what happened, outline the remedies being taken, provide emergency response directions, restore orderly operations, allay concerns, and preserve fragile relationships with key publics.

Today, dark websites are deployed in tandem with various other digital tools: email, text and microblog messages, and already extant blogs, forums, and social networking sites. Web communications are

especially important, however, because the World Wide Web is typically the first place users search for information. Web content managers and technical webmasters (along with media relations, email/text, and social media specialists) play integral roles in an organization's crisis response team. They typically report to the chief public relations officer or the executive directing the organization's communications response.

Because dark websites are created expressly for deployment *if* an incident occurs, they must provide simple, functional templates for how incident-specific information and materials might be posted. Site content typically includes news announcements, updates, fact sheets, Q&As, images, audio sound bites, and video clips.

Links direct visitors to preapproved background information, such as key facts about the organization and its history, the facility/location where the incident occurred (if applicable), safety records, executive biographies, photo archives, videos, and maps. Links are also created and tested in advance to connect visitors to organizational, industry, or community resources accessible during or after the emergency. These often include an organization's human resources/employee benefits group, grief counseling and related services, knowledgeable independent trade groups or industry experts, and local emergency response agencies.

In the early phases of a crisis, dark websites focus on providing timely, accurate, and authoritative facts. Later, they may be transformed into forums for the expression of grief, reflections about what occurred, analysis and commentaries, and explanations about future plans.

Depending on the circumstances, dark websites can be used to replace an organization's main site during a major emergency—but usually only if an organization's operations are shuttered entirely. Alternatively, dark websites typically augment an organization's regular site(s), where a banner, sidebar, or other prominent message is inserted to redirect visitors to the emergency or crisis information without disrupting critical online activities. Finally, issues managers can use independent microsites as dark websites to respond to controversies. These sites have their own web addresses featuring keywords directly related to the controversy. Users are directly referred to the site through promotional communications or find the site through

keyword searches on search engines. Thus, these sites can operate without attracting the attention of the organization's regular website visitors.

BLOGS, VLOGS, AND MICROBLOGS

Blogs, vlogs, and microblogs refer to categories of social media sites and their associated content that utilize such well-known platforms as Blogger, YouTube, and Twitter, respectively. These media share those characteristics that define social media (interactive, user-generated content, etc.) but also may be considered episodic and/or thematic in nature. In other words, content posted on these media tends to revolve around a specific topic or theme, for example cooking or comedy. Despite similarities, blogs, vlogs, and microblogs differ with respect to platforms and content.

Blogs (a contraction of “web logs”) are online, public journals maintained by individuals or organizations (often termed *corporate blogs* for the

latter). Traditional blogs are text-based, and posts typically range from one to three paragraphs with new posts occurring weekly or bi-monthly. Multimedia posts occurring with more frequency have outweighed traditional text posts in recent years.

Blogs are hosted by one of many popular platforms (e.g., Blogger, Tumblr, and WordPress) or via web applications where the platforms are applied to personal websites. Bloggers also include an RSS (really simple syndication) app on main pages so that users in the “blogosphere” can subscribe to updates.

Technorati, a blog search and indexing site, annually publishes a “State of the Blogosphere” study that reports blogger demographics, motivations/consequences of blogging, as well as brands in the blogosphere.

Vlogs (a contraction of “video logs”) use video content as the primary feature. The most popular video-hosting platform is YouTube with more than 800 million unique visitors each month. Other popular platforms include Blip.tv and Vimeo. As opposed to sporadically posted videos, vlogs are episodic in nature and are updated with some frequency, typically bi-monthly. Organizations create channels for followers to subscribe to, and individual videos are rated (like/dislike) and shared on other media (blogs, social networking sites, etc.) by users.

Microblogs differ from the other two because even though they are text-based, the text is limited by the number of characters. Twitter is the most popular of these platforms with more than 600 million users worldwide. The culture of Twitter allows for multiple (140-character or fewer) posts to be made each day. Twitter users can “follow” those people they wish to receive updates from. Most Twitter accounts are public (as opposed to private), which means users can follow other users without prior approval. For organizations, Twitter has become a major medium for handling customer service inquiries.

Public relations professionals may strategically incorporate such media and content into communication programs and campaigns via a direct-to-consumer approach. In using blogs, vlogs, and microblogs, professionals may want to consider the organizational purpose and desired outcomes of using the media, as well as familiarize themselves with the norms of each. Professionals may also want to ensure that appropriate resources

(staff, time, finances, etc.) are dedicated to the use of these media that must be updated and maintained with regularity to be effective. And, analytics tools (Google Analytics for blogs, Channel Stats for YouTube, and TweetStats for Twitter, for examples) can be used to demonstrate the effectiveness of programs and campaigns.

BOULWARISM

Boulwarism is a pejorative term used in labor relations to describe a take-it-or-leave-it stance by a party engaged in collective bargaining. More generally, Boulwarism is the aggressive effort by management to communicate its positions on economic and labor matters directly to (union-organized) employees and communities.

The concept stems from the no-nonsense approach to employee relations advocated by Lemuel R. Boulware (1895–1990), vice president of employees and communications at General Electric (GE) from 1947 to 1961. Boulware was a native of Kentucky who graduated from the

University of Wisconsin, where he briefly taught accounting and commercial law following graduation. During his career, Boulware held posts with the Easy Washing Machine Company, Carrier Corporation, and Celotex Corporation before becoming operations vice chairman of the War Production Board during World War II. He joined GE as a consultant and also oversaw seven of its manufacturing subsidiaries.

Prior to Boulware being appointed to his corporate post, GE had undergone a bitter seven-week strike in 1946. Boulware's charge from GE management was to overcome the distrust and disapproval among employees and neighbors using innovative solutions that avoided mistakes made at other companies. Boulware's lack of experience in labor relations was considered to be a benefit because he provided a fresh perspective.

Boulware delved into his assignment with the same fervor he used in product marketing and began by conducting in-depth interviews. In his 1969 memoirs, Boulware recounts he identified four key groups of "contributor-claimants": customers, owners, other businesses, and employees. He quickly identified three key areas of neglect on the part of GE: It had failed to explain how it benefited others; it had not geared "its intentions, practices, manners and results as intimately as we could and should to the other fellow's viewpoint" (Boulware, 1969, p. 5); and it had failed to manage people's expectations about what was reasonable, possible, and feasible.

Within 6 months, Boulware outlined a nine-point checklist of what employees wanted from their jobs. These included attractive compensation, improved working conditions, competent supervision, a feeling of job security, respect for human dignity, opportunities for promotion, information about management's goals, belief in the importance of one's job, and satisfaction about accomplishments.

Boulware aggressively promoted these ideas to employees. He also launched an economics education program that addressed the importance of profits, how jobs are created, how profits are earned, who pays the costs of doing business, the sizeable share of taxes paid by business, the causes of unemployment, and the dangers of price and wage controls. Boulware used articles and ads in employee publications and oversaw a massive program of

meetings (using materials borrowed from DuPont) where 190,000 employees were paid to attend three 90-minute sessions on "How Our Business System Operates." GE extended the message to communities by taking out full-page newspaper advertisements in cities with a plant location.

As Boulware explained in 1969, his objective was "the deserving and thus the regaining of favorable regard and the active cooperation of employees and neighborhoods in their own interests" (p. 83). He later observed,

I think the real mission of General Electric or any other private business—as well as a requirement for its survival—has been and is to please people by helping them get all they have come, on the basis of enlightened understanding, reasonably to expect from the business in both material and nonmaterial ways. (p. 5)

Boulware's innovative strategy was grounded in solid public relations ideals. First, he strived to correct causes of people's justified dissatisfaction "by getting them to tell us what was wrong and doing all possible not only to right any such wrongs but also to try to right them in their way and not our own." Second, he hoped to correct information or misconceptions that caused unwarranted dissatisfaction—"no matter how far afield we had to go in our own improved education and in helping our employees update their knowledge—and no matter who of high or low estate had to be contradicted in the process" (p. 84).

Boulware's probusiness stance won respect from business leaders, but GE's unions attacked the company viciously as organizers attempted to increase their power and to address displacements in the workforce in the post-World War II economy. As the subtitle of his later book on the topic suggests, Boulware aimed for "trying to do right voluntarily." Yet his approach was decidedly prescriptive, controlling, and antiunion.

Boulware believed employees at GE and other firms didn't understand how many of the criticisms launched against business were rooted in socialist ideology. As Boulware enumerated his concerns, people thought that all managers and owners were brutes and crooks, that private businesses allowed the privileged to exploit helpless workers in the name of profits, and that brute force rather than individual persuasion or individual worth was a

way for people to get what they wanted. Consistent with Cold War fears about the spread of socialism, Boulware was convinced that communists had infiltrated many unions.

Boulware's disdain for unions was particularly reflected in his views on bargaining—the aspect of his work for which he is most remembered. He believed that rank-and-file union members were uninformed, unsophisticated, and misguided by union leaders. Moreover, Boulware argued that union officials came to collective bargaining sessions with an undue advantage: labor union claims were automatically judged to have merit and to be backed widely by employees and by the public at large. Employers, by contrast, were viewed with skepticism, had little support, and were portrayed as the “greedy, wicked and undeserving few” (Boulware, 1969, p. 107). In fact, the Wagner Act of 1935 and the Taft-Hartley Act of 1947 had guaranteed labor the right to collective bargaining and outlawed industrial representation plans (also known as company unions) established in the aftermath of the Colorado coal strike of 1913–1914.

Boulware faulted business leaders for this imbalance and called on them to stand up and tell their story. In his memoirs, he explained,

The plain fact seemed to be that the leftist intellectuals, the nosier of the more leftist union officials and their publications and field organizations, and the federal bureaucracy were operating more and more across the country as the ideological detractors of private business and of the concept of free choice, private property, and limited government on which our unique well-being had been built. (1969, p. 109)

As a champion for business, Boulware challenged attendees at the Harvard Business School's commencement in 1949 to engage in public affairs discussions. “We businessmen are bold and imaginative before commercial competitors. We are cowardly and silent in public when confronted with union and other economic and political doctrines contrary to our beliefs” (Boulware, 1969, p. 163). He added, “We have simply got to learn, and preach, and practice what's the good alternative to socialism. And we have to interpret this to a majority of adults in a way that is understandable and credible and attractive” (p. 165).

To overcome this advantage during labor negotiations in 1948, Boulware obtained permission from the unions to lift the then customary ban on publicity by the parties involved in collective bargaining. Boulware instituted twice daily Teletype dispatches to GE's 140 plants on the progress of negotiations. These bulletins were duplicated for distribution to employees, union stewards, local press, and any other interested parties. Summaries of negotiations also were included in GE's weekly *Employee Relations News Letter*, distributed to 15,000 managers. Local managers were authorized and encouraged to talk to local media, and Boulware regularly engaged the press in New York to tell the company's side of the story.

Reflecting his disdain for the advantages enjoyed by unions, Boulware sought to break the patterns of wage settlements that characterized union negotiations up to that time by staunchly presenting and defending “fair but firm” proposals from the company. Boulware painstakingly researched and fleshed out what he termed a competitive “product” that he believed was both attractive to employees and within the means of the company. Union officials bristled at the tactic. For all of Boulware's talk about balancing common interests, the unions believed that GE was dictating terms and not bargaining in good faith.

Boulware's hardball tactics soon became public knowledge; controversy ensued as media, politicians, commentators, and editorialists took sides. Boulware later explained that he was not inflexible. Indeed, only one of his opening proposals ever became a part of a GE-union contract without amendment. Boulware said he always welcomed unions to provide “any old or new information proving changes would be in the balanced interests of all” (Boulware, cited in Peterson, 1991, p. 147)

Boulware's stance in GE's 1960 negotiations with the International Union of Electrical, Radio and Machine Workers, AFL-CIO, led the National Labor Relations Board (NLRB) to rule that GE had engaged in unfair labor practices. The NLRB now requires representatives in collective bargaining to negotiate in good faith. This involves a willingness to listen to counterproposals and a prohibition against pro forma refusals to make changes in a package offer. Although none of Boulware's tactics was illegal in the abstract, the NLRB and subsequent court rulings found that the overall effect of GE's tactics was to circumvent the rights of unions.

Boulwarism is an example of an important business concept stemming out of public relations practice. The prohibition against Boulware's negotiation approach is a firmly established principle regularly addressed in labor law. Boulwarism also represents an important—but possibly misdirected—effort to address antibusiness sentiments in modern society. One indirect effect of Boulware's work was the resurgence in probusiness sentiments in the 1980s under the presidency of Ronald Reagan. GE had hired Reagan to heighten the popularity of its weekly TV series in the 1950s, and Boulware sent Reagan on a tour of GE plants where the future president—then a liberal anticommunist—was fully indoctrinated in GE's free enterprise philosophy.

Boulware's work is also a historically important case study of how one organization recognized the importance of building mutually beneficial relationships and how management sought to establish a more balanced relationship with key constituencies. It is also an example of the failed application of what is characterized today as two-way asymmetric communication. Although Boulware's approach to employee education has never been completely assessed, his labor negotiation strategy proved unsuccessful in the long term.

BOURDIEU, PIERRE, AND PUBLIC RELATIONS

Pierre Bourdieu (1930–2002) was a French sociologist whose work focused on explaining the operation of the social world in relational terms. Trained as an anthropologist, he combined analyses of day-to-day practice with that of social context in an attempt to explain the ways in which our lives unfold.

For Bourdieu, the key to understanding society is to recognize that the meaning of the attributes of the social world (such as professions, gender, educational qualifications, appearance) can only be understood within the context of the relationships in which they are relevant. This relational context, and the place of a particular attribute within a system of relations, called a field, must be analyzed in terms of its material attributes as well as its symbolic properties:

Individuals or groups are objectively defined not only by what they are but by what they are reputed to be, a “being-perceived” which, even if it closely depends on their being, is never totally reducible to this. Social science therefore has to take account of the two kinds of properties that are objectively attached to them: on the one hand, material properties, starting with the body, that can be counted and measured like any other thing of the physical world; and on the other hand, symbolic properties which are nothing other than material properties when perceived and appreciated in their mutual relationships. (Bourdieu, 1990, p. 135)

It is the symbolic level of analysis that Bourdieu uses to explain the nature of power in society. He argued that systems of relations, or structures, are hierarchical and inherently conflict; they are structured in oppositional terms, where the fundamental division is between those who dominate and those who are dominated. These symbolic systems offer ways of understanding the world by organizing it into comprehensible systems (structuring structures); ways of knowing the world through shared meanings (structured structures); and ways of political organization, through their integrative role (for dominant groups) and divisive role

(between dominant and dominated groups). In short, these structures play a major role in creating our habitus—the set of durable dispositions developed and inculcated over time that determine the way we comprehend our social environment and our role within it.

Dominant groups or individuals seek to maintain the fundamental oppositions inherent in structures in order to preserve their dominant position. Consequently, Bourdieu argued that these structures are essentially arbitrary, created through historical determinism and sustained by immediate interests.

In the context of these structures, the expectations and norms set out by them, and the corresponding understandings of the habitus, individuals draw on material, cultural, and social resources or capital to execute strategies that allow them to realize their interests. Bourdieu defined four types of capital: economic (primarily financial), social (relating to the social networks to which one belongs), cultural (relating to educational and cultural background and resulting access to and understandings of cultural artefacts), and symbolic (economic, social, or cultural capital that possesses symbolic value that determines the degree of power associated with it). The level of different types of capital that an individual possesses determines his or her membership in dominant groups.

The transformation of economic, social, and cultural capital into symbolic capital attributes more and different meaning and value to such capital than its material attributes would suggest (Bourdieu, 1984). These meanings are ideological and arbitrary rather than material and disinterested, ultimately generating symbolic value for that particular type of capital. They are understood by individuals as normalized, legitimate social distinctions, and often the interests that underpin symbolic attribution go unnoticed. Because symbolic value is supported by the interests of those who determine which types of capital attract such value and yet is misrepresented as disinterested, it generates symbolic power and legitimacy for those who possess such resources. Bourdieu illustrated this process both generally as well as in specific fields, including education and culture.

Those who have the ability to determine and maintain symbolic classifications and distinctions between types of capital, while disguising the real interests that underpin such distinctions, are those

who enjoy symbolic power in a particular field. These groups or individuals also possess the greatest amount of symbolic capital, since the classifications they promote are those that promote their own position.

Bourdieu's work has been used only to a limited extent in public relations scholarship. Øyvind Ihlen (2005; 2007) used his ideas of capital and relational analysis to interpret the work done by practitioners as a form of extending capital and, particularly, social capital, to help organizations shore up their positions relative to competitors and elite groups in society. Rebecca Harris (2005) used Bourdieu's notion of fields to challenge the apparent neutrality of public relations work when carried out in the context of the gambling industry, while Lee Edwards has focused more on the ways in which Bourdieu can be used to understand the production and maintenance of symbolic power both within the field and in wider society. While limited, this research illustrates an important aspect of Bourdieuan approach: It prioritizes the sociocultural effects of public relations rather than focusing purely on its organizational function (Edwards, 2006; 2009; 2012). As such, it demands an ontological and epistemological shift in the scholarly understanding of public and greater methodological flexibility in research. Nonetheless, the range of insights that a Bourdieuan approach has generated through the work of these three scholars speaks to the potential that he offers for the future of scholarship.

BOXED PRINT

Newspapers, magazines, brochures, pamphlets, and virtually all other publications have a variety of “makeup” options that an editor can select to communicate visually to the reader. Such questions of design are equally important on the Internet and the World Wide Web, both on “landing pages” and elsewhere on a website to encourage, direct, and engage readers. A well-laid-out page spread of a newspaper or other printed publication (e.g., a magazine, a newsletter, or a pamphlet) not only is attractive and inviting but also directs readers across the page spread in a way that can be predicted and controlled. The spread can showcase what the editor wants to emphasize as well as direct readers in the sequential order that the editor or designer wants the elements viewed. Importantly, except for the front and back pages, a publication’s “page spread” of facing left and right pages is usually considered as one visual unit.

Indeed, a knowledgeable and skilled layout editor or graphic designer can predict and control with almost complete certainty how readers proceed in viewing information that is presented on the page spread, using such elements of makeup as body copy (text); headlines, subheads and editorial blurbs/pullout quotes; photographs and other art (e.g., line art) and their accompanying cutlines/captions; and white (negative) space—all of which

can be used to entice and enhance readership and to make information-processing as easy as possible for the readers.

Of course, different publications are used in different ways; for example, newspaper editors know that virtually no one will read the whole newspaper, so they present content (stories and art, including photographs) in a way that helps readers select what is most significant to them and/or what interests them the most. Magazine editors likewise know that few people read a whole magazine cover-to-cover, although they hope readers will be interested in a far greater percentage of an issue’s feature-length stories than would read a similar portion of the myriad stories that are presented in a newspaper. Pamphlets and brochures are most often designed to be read in their entirety and are laid out accordingly—to encourage readership of the whole publication, usually from front to back. The seeming infinity of a website and its links creates another dimension and another set of challenges for content editors who attempt to direct readers.

To add visual interest as well as to feature or spotlight a story or article, boxes are frequently used to surround the print (i.e., the text). Traditional newspaper makeup uses boxed print on occasion to showcase a short human-interest story as well as to brighten a page. “Modular” newspaper makeup depends on boxed print to dramatize a large and important story, and the corresponding text is usually surrounded by a quite narrow “hair-line rule,” which may have either squared corners or rounded corners, that surrounds the story and its accompanying art, for example, photographs and cutlines (more commonly referred to today as captions). The use of boxed print requires at least a two-column story (some editors may argue that at least a three-column story is better), and each page may have a boxed print (it’s usually better to have only one such boxed print per page or else all emphasis can become no emphasis). As a visual element, boxes add “weight” to a page or page spread that helps balance or contrast other visual elements, and thus boxed prints may appear at the bottom of a page to help create page balance.

Of course, magazines frequently use boxed prints (sometimes with a grey or colored screen inside the box on which the text is overprinted) to emphasize or to distinguish the story from others

on a page spread. Brochures and pamphlets may use boxed prints as an integral part of their design theme; for example, copy (text) on each page may be inside a box, or each page may have a border box. Of course, websites use boxed prints a great deal, and many of the guidelines that apply to boxed prints in printed publications are equally valid for websites.

Boxed prints (i.e., text set inside boxes) are highly effective when used well, tastefully, and with discretion to visually communicate that the text inside each box is special in some way; for example, it is more important than or is significantly different from surrounding text. Boxed print may be a “sidebar” story to the main story, may be used to provide balance and contrast to pages, and is often used to brighten pages. However, the public relations person doing his or her own makeup of employee newspapers, magazines, brochures, and pamphlets must remember that there can be too much of a good thing—too many boxed prints on a page or page spread may mean that each one loses some of its potential effectiveness.

BRAND EQUITY AND BRANDING

The concepts of *brand equity* and *branding* are necessarily intertwined, and they are connected with both advertising and public relations and are informed by impression management theory. Lisa Wood (2000) indicated that there are several different meanings of brand equity: First, it may be construed as the total value of a brand as a distinct asset. In other words, when the brand is actually sold in the marketplace or included on a balance sheet. Second, brand equity may be interpreted as a measure of the strength of consumer attachment to a brand. Finally, it may be considered a description

of the associations and beliefs the consumer has about a particular brand. The distinctions in these various definitions primarily derive from accounting and marketing.

In many cases, financial accountants (preferring the first definition) will use the term *brand value* rather than *brand equity*. The brand’s value, relative to the rest of the marketplace, emerges as the overriding consideration. Advertising and public relations professionals generally recognize this first definition, but they tend to be more interested in customer–brand relationships and associations. These professionals will often build on the brand equity concept with ideas, such as *brand identity* or *brand image*.

Brand image is aligned with the needs and desires of a target market by utilizing the “four P’s” (product, price, place, and promotion). The combined success of these factors determines *brand strength*, the degree of loyalty or attachment customers feel toward the brand. Because there are a number of related concepts, Max Blackston (2000) summarized them with the key principle of brand equity; a brand is necessarily intertwined with a product(s), but it is different because there is a consumer investment over time.

Brand equity consists of the incremental, added-value qualities that synergistically combine in the minds of consumers. A brand may be a product, but it can also represent an organization through the creation of a unique identity.

Blackston argued that the fundamental marketing variables (product, price, etc.) are critical values, but the *added value* concept is where the success of branding is truly realized. However, this concept is difficult to define because of its intangible nature. Generally, this idea is indirectly measured or inferred in terms of the consumer’s idea of the brand. Even though such inferences will continue, Blackston posited that greater understanding of brand equity may be achieved by recognizing that brand relationships are occurring, interactive processes involving both the brand and the consumer. Relationships are, of course, constructed through communication. The organization is projecting an image, and consumers are providing meaning to the messages. Thus, a relationship between the brand and the consumer flourishes or disintegrates. These brand relationships comprise two key factors that are necessary for synergistic

success: trust in the brand and customer satisfaction with the brand. In other words, added value is realized when these factors are maximized.

The brand's success depends on the creation of a personal link with each consumer, and obviously, this objective is not easy to achieve, but when an organization moves from a self-centered to an "othercentered" (customer-focused) stance, success in these relationships may be eventually achieved. Blackston indicated that the brand relationship concept has been applied to the development of advertising campaigns, but it can be extended to all areas of marketing communication, including public relations. An objective for a desired relationship with the critical stakeholders (the consumers) may provide a guide for the brand's "communication" transactions with each consumer. Because behavioral consistency is essential for long-term relationship success, the sales promotion, packaging, and public relations that are associated with a brand must be consistent. When the consumer is satisfied and trusts these consistent behaviors, they are likely to continue the brand relationship and, thus, added value may be achieved over time in the branding experience. Corporate branding (and brand equity) is the "true" mark of a product or organization. In other words, it can be construed as a unique declaration of identity, quality, trust, and value with the final judgment on those factors resting with the individual consumer.

With the branding concept in public relations (and related areas of communication), four process areas are often considered: (1) creating, (2) maintaining, (3) damaging, and (4) repairing. Creating unique identities for products is challenging, considering the vast array of information that consumers are exposed to in the marketplace. William Wells, John Burnett, and Sandra Moriarty (2003) provided the following suggestions for advertising and public relations professionals as they create messages about their brands:

1. Make the brand distinctive by drawing attention to its qualities/strengths.
2. Utilize a design that aligns with the brand image that you wish to project and send public relations and advertising messages that are generally consistent with other mass media messages.
3. Make the packaging as functional as possible.
4. Product packaging, advertising, and public relations should dovetail. In other words, consistency is repeatedly emphasized.

Organizations need to ensure that their resources are committed to brands that offer the greatest likelihood of success, whether those brands are products or subunits of the organizations with their own distinct identities. As Peter Sackett and Efstathios Kefallonitis (2003) argued, creating a unique brand experience reflects the organization's advantages over its competitors. Thus, the organization maintains its existing customer base and also attracts other consumers.

Sackett and Kefallonitis also emphasized the importance of aligning the consistency, originality, and relevance of the brand experience to the core brand value (i.e., quality or durability) that is being communicated. If this alignment does not occur, organizations will struggle to differentiate their brands in the vast consumer universe of information. They posited that creating brands involves attention to consumers' perceptions of similar brands in the marketplace and, then, designing product features that are not only distinct but also add value to those perceptions. Thus, added value is created and potentially sustained for consumers and organizations.

In many cases, organizations will conduct research (i.e., interviews and surveys) to determine the likely importance of various attributes in brand choice processes. In short, what is missing in the marketplace? What would consumers like to see as they perceive it? Subsequently, a brand is developed that addresses these needs and perceptions, and this data is aligned with information on the target market (i.e., senior citizens). Of course, not all organizations follow these procedures with brand creation, but in general, sophisticated organizations in the modern business environment engage in these rigorous market research activities.

Brian Wansink (1997) advanced some additional thoughts on the brand creation discussion by talking about "re-creating" brands or providing a revised brand perspective for consumers. Many marketing managers believe that brands, like many other natural life cycles, observe the laws of positive entropy; they are created, they

grow, they mature, they decline, and they die. In some cases, brand sales and market share decline because people have lost interest due to changing conditions in the marketplace (i.e., typewriters and the advent of word processing) or because another brand becomes more salient for consumers. Wansink illustrated this recreation with the Arm & Hammer situation in 1969. The product's sales were declining because of reduced home baking and the introduction of ready-to-bake packaged food products. In order to address these issues, the product re-emerged as a deodorizer for refrigerators, freezers, and kitchen sink drains.

The product's sales rebounded. Even though brand creation and recreation are distinct in terms of actual product existence, the same principle guides the success of these processes: addressing the needs of consumers and their perceptions in relation to your product or organizational niche.

Brand recreation can also be considered, in some product cases, a natural maintenance activity. In order to maintain a successful brand relationship (as in many other relationships), some modifications may need to occur. Of course, there are cases where limited brand maintenance occurs because the product continues to address the needs of consumers in its particular niche. However, ongoing communication campaigns are always recommended so that consumers are consistently reminded about the attributes and strengths of the organization or product.

Typically, organizations have different brand maintenance strategies and tactics. For example, some organizations focus on their brand name, making it synonymous with a product class. These corporate brand names appear as the only brand identity. Corporate brands are used when a company operates in a tightly defined market (e.g., Kellogg's with breakfast cereal). Promoting related products is a brand maintenance strategy for the organization as well as for the potential variety of brand names (e.g., Raisin Bran). Standardization strategies may also be employed when companies wish to associate related products or names internationally. Additionally, corporate history can be influential when brands are leveraged or *extended*. With this strategy, a corporate brand name is maintained by association with new products. In other words, the brand name is revitalized and recreated.

As the information age continues, dynamic brand maintenance strategies are necessary. Brand leverage is an example of such a strategy, along with the more general goal of creativity. Maintaining an information-based context may also be useful. In other words, through a medium such as a website, people consume, communicate, and transact with the organization or corporate brand. With website maintenance, the corporation's identity (and that of its associated brands) is preserved in the minds of consumers. Even though some modifications may inevitably occur, the brand is still important because a personal link to the consumer is maintained. Brand maintenance and relationship maintenance are not distinct concepts; they are necessarily intertwined.

In some cases, damage to a brand name's reputation occurs. Malfeasance on the part of managers or the mishandling of crisis situations may provide rationales for why such damage occurs. Because organizations can be construed as brands, there are numerous examples of brand names that have endured injurious circumstances. The debacles that have plagued corporations, such as Exxon (1989 oil tanker mishap) and MCI (misappropriation of corporate funds in 2001 and 2002) are documented in the popular media. Typically, such an event creates a thriving environment for brand damage, especially if stakeholders, such as customers, perceive that the organization does not care or is mishandling the situation.

However, brand identity may also become poorly perceived in an incremental fashion. Over the course of time, without proper maintenance, brand damage will probably occur and, eventually, the brand's image cannot be restored to its prior positive state. If brand identity is perceived as poor (damaged), the brand experience that is created is unfavorable. Corporate brand names can also be damaged by claims from internal and external stakeholder groups, such as the media, that are inconsistent with the organization's story. Such claims can damage brands. However, if the organization can distance itself from the claims and provide evidence of accountability on the part of other parties, brand damage may be limited. On the other hand, social legitimacy and financial stability may be permanently harmed.

The image restoration strategies that are employed by various organizations provide insight

into the subject of brand repair, rejuvenating a damaged brand name.

W. L. Benoit (1995) provided a typology of brand repair and image restoration strategies for corporations: (1) denial, (2) evasion of responsibility, (3) reduction of offensiveness, (4) corrective action, and (5) mortification. Each of these strategies may be effective in particular circumstances. With the first two strategies, if the organization can legitimately deny or not take responsibility for a potentially damaging situation, these communicative stances may be appropriate. Benoit also provides the following suggestions for image repair discourse:

1. Avoid making false claims for brands and provide adequate support.
2. If your organization is responsible, admit this fact immediately.
3. Communicate plans to correct and prevent recurrence of the problem.

The final recommendation might be classified as goodwill, if such actions are designed to enhance a community or group of stakeholders beyond simple repair of brand damage. If customers perceive that the organization is truly acting in their best interests, brand repair begins to occur. It should also be noted that restoration tactics may not involve a long period of time, if the organization is honest with their stakeholders about crises and claims. In these cases, brand damage is limited because the organization assumes responsibility and provides evidence related to claims.

Audience perceptions are critical to brand repair and image restoration. In terms of perceptions, if the organization reminds stakeholders of past good works and relationships through bolstering communication strategies without addressing the critical brand-damaging issue(s), brand repair may not even occur.

Customers may quickly reject the brand, or it may eventually fade from the public scene because such reminders fall into a communicative vacuum chamber.

BRAZIL, PRACTICE OF PUBLIC RELATIONS IN

Brazil is unique among the Latin American countries in the area of public relations; recognized for having spearheaded the introduction of the activity and for having traced a remarkable trajectory of the profession. The first public relations department was established in 1914, at the Canadian São Paulo Tramway Light and Power Co. Between 1910 and 1950, the practice was restricted to a few multinational corporations and a handful of governmental bodies. At the time, the practice was in the hands of professionals from a vast range of specialization areas, such as lawyers, engineers, and managers who were being transferred into the country to work for the transnational corporations. Entrusted with this task, those professionals sought to widen their scope of knowledge by traveling abroad and enrolling in short courses sponsored by universities and other learning centers.

In 1954, the Brazilian Public Relations Association (ABRP) was established with the primary

purpose of promoting the practice in Brazil. Several foreign experts, such as Harwood I. Childs, Eric Carlson, and Neville Sheperd, visited the country to teach courses in public relations to local professionals. At that time, ABRP contributed both to the formalization of the profession and to the promotion of research in the field, with the aim of refining and standardizing the teaching and practice of public relations. From the 1950s to the 1960s, the country underwent impressive economic growth and saw the establishment of public relations structures in undertakings, such as Companhia Siderúrgica Nacional (CSN), the national steel producer (1950), General Motors do Brasil (1962), Pirelli (1963), Ceval Arz Gerais Ltda. (Sambra) (1969), and Philips (1970).

In 1964, the newly installed military regime embarked on the systematic and articulate practice of censorship and control of the entire communication system. The 1967 law, no. 5.377, regulated the profession and was a step in the deliberate attempt by the state to control communication organizations and institutions in Brazil. In that same year, a university-level public relations course was created at Universidade de São Paulo; other programs were subsequently established throughout the country. The creation of university-level courses in public relations in Brazil underpinned the development of the field and contributed to shortening the distance between academia and professionals. The year 1969 saw the creation of CONFERP, the Federal Board of Public Relations Professionals, whose purpose was to oversee and discipline the professional practice across the country. The board comprises six regional councils whose remit is the supervision of the practice within their respective territories. In 1970, graduate programs were created, including master's and PhD degrees in public relations. Today, a total of 10 different programs are offered throughout the country, including degrees in social communication.

With the approval of law no. 5.377, Brazil began to distance itself from its neighbors, where the practice saw a later start, and where no attempts to institutionalize the profession by force of legislation were registered.

From the 1970s and into the 1980s, the military government made consistent use of public relations to develop a series of nationalist campaigns for the promotion of state initiatives and to mask censorship in the country. Some examples of this practice,

whose underlying purpose was to project Brazil as a “booming” country, are campaigns associated with the country's third victory in the Fédération Internationale de Football Association (FIFA) World Cup, including the lyrics of the hymn “Ninety million in action” (the total population at the time), as well as the creation of slogans disseminated in the media to promote the national colors—green and yellow. This self-serving practice led to the misrepresentation of the essence of public relations, which became associated with kowtowing, untruthfulness, and the unethical use of the media.

However, from the second half of the 1980s Brazilian public relations recovered its original vocation and continued to evolve substantiated by four major developments: political overture toward democracy; economic changes; the installation of multinational public relations agencies and the establishment of local agencies; and the advancement of scientific activity in the field. Since then, the empowerment of public opinion has also contributed to stress the responsibility and transparency of undertakings; additionally, corporate social responsibility has become a new dimension of the ethical behavior underlying the relationship between undertakings and institutions and their publics.

By the 1990s, new challenges had emerged, and from 1993 to 1997 they were addressed at CONFERP's National Public Relations Parliament sessions. The initiative was the first attempt to redeem the concept of public relations, and it gathered scholars, researchers, and professionals around the table to discuss the future of the profession and its strategic function in the contemporary Brazilian society. Among the proposals advanced by the group was an amendment to the legislation in force (law no. 5.377), with the intent to extend CONFERP membership to professionals specialized in other fields, with the condition of the submittal of proof of completion of a *lato* or *stricto sensu* program in public relations. Yet, the amendment was never put to a vote in the legislative chamber.

Understanding the practice in Brazil, in particular, and Latin America, in general, requires an understanding of the influence of the sociopolitical forces on society during the second half of the 20th century. Maria Aparecida Ferrari and Fábio França (2011) pointed to the fact that the lack of a specific *corpus doctrinae* in public relations in the region

resulted in a high degree of subordination and dependence of practitioners on concepts and tools borrowed from the North American model, a phenomenon that represents an additional hindrance to the development of the practice of suitable public relations in the continent, particularly in Brazil. The absence of an indigenous public relations model is directly linked to the adoption of the U.S. pragmatic mainstream by the foreign undertakings that began to operate throughout South America from the 1950s. The highly pragmatic and functionalist approach of the U.S. public relations model had a profound influence on Brazilian professionals, whose function was seen and defined as one of safeguarding the company's image and defending its status quo.

At the close of the 20th century, the unremitting demands imposed by globalization and the technological advancements forced companies to respond and adapt to the new reality, by rationalizing processes and speeding up the transmission of data and information. In this new environment, social networks and electronic communication tools were made available, and organizations and professionals alike have seen new horizons open up for the practice. Research shows that since 1990, public relations in Brazil has evolved and surpassed the fields of journalism and advertisement. Today, companies seek professionals who are able to understand the social context and to conceive projects strictly linked to the organization's purpose of meeting the demands of their strategic publics. Today, two major trends can be identified within public relations in Brazil: The first consists of the analysis of the intercultural dimension in the communication process of organizations and governments; the second is the formulation of strategies for survival in increasingly vulnerable scenarios.

The ultimate challenge presented to scholars is the promotion of knowledge to ensure professionals an area of true cooperation in the search to strengthen the brand for organizations and institutions.

Brazil is a true "continent" within Latin America, as a result of its geographical dimension and its population, now rounding 193 million (according to 2012 Instituto Brasileiro de Geografia e Estatística statistics). It is also recognized as the world's fifth most important economy. Despite its newness, public relations as a profession has

established a respectable position within the large undertakings and government bodies. A challenge yet to be addressed is the introduction of the practice to medium- and small-size companies, which account for 80% of all business activity in the country, and are, as a rule, family-owned and managed.

Today, 110 university-level courses are available in the area of public relations in the country (Ministry for Education, 2012). Additionally, the market for public relations encompasses over 1000 public relations agencies, both domestic and transnational, offering the full range of sophisticated communication and research services, aimed at fostering the relationship between organizations and institutions and their respective strategic publics for the purpose of building consensus and promoting understanding between the parties.

BRIDGE

Bridge is a term derived from both stage and journalism to mean *transition*. Usage of this word as a

term of art when referring to crisis responses and media training probably results from adaptation by public relations professionals of its many definitions in the related fields of journalism, graphic design or layout, theater, and broadcasting or film.

In journalism, the term's most common definition has meaning to writers and editors alike. Both use *bridge* to mean the "logical transition from the summary information of the lead to the detailed information in the body of the story when using the inverted pyramid structure method of news-writing" (Conners, 1982, pp. 99–100). When used in this context, the term *bridge* serves to explain and expand on the information in the lead. In more general usage, writers use the term to mean "a phrase or sentence connecting two stories" (Newsom, Turk, & Kruckeberg, 2000, p. 519) or "a few words tying one element of news to another" (Weiner, 1996, p. 78). To editors, *bridge* refers to "a proof-reader's mark indicating that two letters or words should be connected" (Weiner, 1996, p. 78), whereas graphic designers and layout artists use *bridge* to mean "type or art that runs across the *gutter* and links two adjacent pages, more commonly called a *crossover* or *gutter bleed*" (Weiner, 1996, p. 78, italics in original).

In theater, broadcasting, and film, *bridge* conveys not just a changing of scenes, but often a changing of emotion, as well. Public relations educators Doug Newsom, Judy VanSlyke Turk, and Dean Kruckeberg (2000) define *bridge* in terms of its usage in broadcasting as "transitional program music" (p. 519). According to *The Dictionary of Media Terms*, a bridge is a "music cue used to carry us from one scene or one mood to another" (Penney, 1984, p. 27). *NTC's Mass Media Dictionary* expands on that definition and defines *bridge* as "sound effects or music used to indicate a lapse of time, or to link dramatic scenes" (Ellmore, 1991, p. 77). The *Longman Dictionary of Mass Media & Communication* summarizes these ideas with the following entry: "Narrative, sound, or music section used to transition between two scenes or to show an elapse of time or change of mood or locale" (Conners, 1982, pp. 99–100). Finally, *Webster's New World Dictionary of Media and Communications* includes the visual with the auditory, as it includes in its definition "a musical, visual, or other type of transition, particularly between scenes (a *bridging shot*)" (Weiner, 1996,

p. 78, italics in original). An interesting, but also germane, definition of the term used in theater refers to "a narrow platform on which stage lights (*bridge lights*) are mounted, usually called a *light bridge* in the United States or *lighting bridge* in the United Kingdom" (Weiner, 1996, p. 78, italics in original). *NTC's Mass Media Dictionary* notes, "Luminaries and projection devices are accessible during performances" (Ellmore, 1991, p. 77).

In public relations, *bridge* refers primarily to the technique used in a crisis response or while training someone to deal with the media that allows the speaker to take control of the interview. Simply stated, the speaker connects his or her answer to the interviewer's question or subject to a topic of his or her own choosing or to his or her communication points or commercials. Put another way, the speaker *reframes* the question or issue to allow the points they want made to lead the response.

Done poorly, bridging can be offensive and disingenuous to journalist and viewer alike. An example one journalist used to illustrate this point was the response U.S. senator Warner (R-Va.) gave when challenged about whether the Iraqis had taunted the United States in a message. His answer to the question: "I want to turn to this other thing."

Successful use of the bridge starts with communication points, or commercials. These are the one, two, or three things the speaker wants the audience to remember, even if they don't remember anything else. Some public relations professionals prefer message mapping instead of communication points—where all roads lead to a central point—but the intent is the same: The speaker has a message that he or she wants heard.

Once the communication points are established, they become the point the speaker makes first in response to a question. The bridge technique then connects the communication point(s) to a more expansive explanation of the point or to another of the speaker's communication points. Phrases such as "That's such a complex subject . . .," "Your question really relates to . . .," and "You bring up an interesting point, but before I discuss that, it's important to note that . . ." are all good bridges.

A good example of how communication points and bridges interoperate can be seen in the following mock interchange, regarding an accident that claimed several lives:

- Reporter:* “Witnesses claim they saw the aircraft oscillating wildly just before it plowed into those hangers over there. What can you tell us about the maintenance standards of your company and could that have been the cause of this accident?”
- Spokesperson:* “Obviously, we won’t know the cause of the accident until after the investigation is completed (communication point). Your question really relates to our maintenance practices (bridge) and that is a part of our business that we take very seriously (second communication point). We have an extensive training program that requires continual refresher courses and includes an extensive certification process. . . .”

Though allowing the spokesperson to control the interview, the effective use of the bridging technique in the interchange above helped improve the communication between the two parties by providing additional information and perspective on the issue at hand. Had the spokesperson merely stated that the accident was under investigation and provided nothing further, or worse yet, ineffectively used the bridging technique to try to deflect the reporter’s legitimate question, the public would not have been served well, and the relationship between spokesperson and reporter would have become unnecessarily tense and adversarial.

Effective use of the bridge incorporates many of the attributes found in definitions of the term from journalism, graphic design or layout, theater, and broadcasting or film. It connects your lead, or the most important information in the story, to the rest of the story and serves to explain and expand on the information in the lead (journalism). It conveys a changing of scenes and often emotion (theater, broadcasting, and film) when used to connect two communication points, especially if one of those points is a statement of condolence, concern, or regret. Finally, by providing additional explanation and perspective or expanding on particular points, the bridge serves to illuminate and remains accessible throughout the conversation (theater).

BROCHURE

A brochure is a printed piece of collateral material used for public relations, advertising, and marketing purposes. Brochures are considered a communication tool or tactic and a form of direct media, such as fliers, newsletters, and posters, which reaches its audiences through distribution channels other than mass media (i.e., newspapers, magazines, radio, and television). Other terms used to describe brochures are *pamphlets*, considered simple versions of brochures, and *booklets*, which are brochures that are produced in small, booklike formats.

Every organization, whether corporate or non-profit, needs brochures to convey key messages to particular target audiences. A brochure is a tactic with a specific objective. For example, brochures can educate an employee audience about company policies, inform customers about new products, or encourage members of a community to use a program offered by a nonprofit organization.

Brochures communicate a sizable amount of information to a single reader at a handheld viewing distance. An orderly sequence of information is presented in stages through panels using a common design thread that visually connects all of the panels and helps entice and sustain the reader’s attention.

Brochures are commonly distributed to a target audience interpersonally, in information racks and through the mail in a standard business envelope. In order to be effective, brochures must be strategically sound, which means they need to be targeted toward a particular audience, convey an overall key message, and attempt to achieve a specific objective. Some of the most common objectives in

public relations include increasing awareness about a specific organization and educating the target audience about a specific service or product.

Brochures are produced in a variety of styles, shapes, and sizes. A format often used in public relations is a simple two-fold, six-panel, 8½ × 11 brochure. Another popular format is a one-fold, four-panel, 8½ × 11 brochure, which can be expanded by adding multiple pages. Brochures can be folded and bound in many ways. Letter, broadside, map, and accordion folds are commonly used. A common type of binding for booklets is a saddle stitch, which involves a staple through the spine of the publication.

Brochures need to be created with a unifying design throughout the entire publication, which can be conveyed through an appropriate choice of typeface, line rules, screens and tints, clip art, and color schemes. Brochures are commonly printed in one color, spot color (usually black for the type and another color to highlight specific areas in the brochure), and full color, which is the most expensive to produce. Some public relations practitioners begin with a layout and copy for a brochure and then work with a designer and/or printer to develop the final printed piece. Other practitioners create the entire piece themselves, using any number of desktop publishing programs, such as PageMaker, Quark Xpress, Adobe InDesign, and Microsoft Publisher.

BUSINESS WIRE

Business Wire is a commercial news distribution service, one of many available today. During its more than 50 years of operation, it has traditionally been either the leader or one of the top two

such services in revenue and number of customers and subscribers. The company is a wholly owned subsidiary of Berkshire Hathaway.

Business Wire got its start by electronically distributing news releases on behalf of public relations clients and has evolved to offer services that include online newsrooms, measurement tools, and more.

Public relations clients—called *member companies*—provide news releases, photos, regulatory filings, multimedia, and other content to Business Wire. For a fee, the company disseminates the information to journalists, investors, researchers, and other audiences simultaneously and in real time, to the geographic market, industry audiences, and editorial desks requested by the client.

The company serves clients in more than 200 different industries through more than 30 bureaus in Asia, Australia, Europe, and North America.

The company also provides a variety of services to help organizations manage their corporate communications and research needs. Publicly traded companies can use Business Wire to meet requirements for public disclosure. Business Wire was the first news-wire to offer to its public company clients a system specific to filings of the Securities and Exchange Commission called Education Department General Administrative Regulations, or EDGAR. The service is also used by financial and research databases and online news organizations who store company news releases distributed by Business Wire and make them available in company news archives.

Founded in San Francisco in 1961 by veteran journalist and public relations executive Lorry I. Lokey, the company started out with seven clients and distributed news releases to 16 news organizations in Northern California. Through the next decade, it expanded its geographic reach by forming affiliations with other wires, such as the Associated Press.

The speed that a news service could distribute information was a major attraction of the service. By 1967, Business Wire's ability to send 100 words per minute—which equates to sending a standard news release in about 5–10 minutes—was the fastest of any service. A decade later, the service reached a new level when Business Wire inaugurated satellite-to-computer delivery of news releases, the first to do so, increasing its speed to 1,200 words per minute. Today, instantaneous distribution is the new norm. As of 2012, Business Wire is the only commercial newswire to own its own patented, Internet-based simultaneous delivery system.

The company continued to expand its services and offices in the 1980s. It also created its Analyst-Wire service, which connected clients with financial analysts, and SportsWire and EntertainmentWire, services that brought sports- and entertainment-related news to key sports and entertainment media.

Later developments, in the 1990s, included the addition of Associated Press (AP) PhotoExpress service for commercial photo satellite delivery, the first commercial website for a newswire and the industry's first multimedia news release.

In 2003, the company became the first commercial newswire to distribute its content over AP's Internet-based delivery platform. Over the next decade, the company added services, such as the Public Policy Wire and Latino Wire, capabilities that enhance search engine optimization (SEO), mobile distribution, and online newsrooms that can be maintained on Business Wire's website.

BYLINE

Byline is the term used for the signature line of a newspaper article or other contributed piece to a news publication. Bylines refer to the author or authors of a news item and appear in conjunction with the dateline and the place where the story originated, if it is not a local story. For news articles received via a wire service, a byline is not reported and credit is given to the respective news service, such as the Associated Press. Internal newsletters may or may not allow for bylines if the articles are written by a staff member.

For public relations practitioners, securing a byline is not as important as it is to reporters. Press releases do not contain a byline; they include only contact information for reporters who need additional information. If a reporter uses a press release to write his or her article, he or she receives the

byline. Even if public relations practitioners issue press releases on behalf of a client, the reporter gets the byline.

If a reporter prints a press release in its entirety, the reporter gets the byline, not the person who wrote the release. Because this sometimes happens, it is imperative that a press release contain accurate information and be written as if it were going to be printed as submitted.

Reporters have an urgency to “get the byline,” but there are certain checks in place to ensure that this need for “immediate and frequent reward” does not cause a story to be written prematurely (Mencher, 2000, p. 419).

Mencher made the point that when a reporter was given a byline, that means that they were *actually present* and on the scene before writing the story. Mencher refers to an “old-timer,” who commented,

In the old days, a reporter was given a byline if he or she personally covered an important or unusual story, or the story was an exclusive. Sometimes if the writing was superior, a byline was given. Nowadays, everyone gets a byline, even if the story is a rewrite and the reporter never saw the event described in the story. (2000, p. 766)

Public relations practitioners should be aware of this issue in journalism and should work to provide reporters with all pertinent facts. Although the public relations practitioner does not receive the byline for the article, it is highly likely that they will be quoted in the article. Whether those quotes are supplied in a press release or given through follow-up interviews with a reporter, the article's truth will fall back on the public relations practitioner and the organization.

CAMPAIGN

A campaign is the strategic design of a series of messages sent to one or more targeted publics for a discrete period of time in response to a positive or negative situation affecting the organization. An organization or agency plans a campaign by utilizing paid messages, unpaid message outlets, such as press releases, or other news events to respond to a crisis affecting the organization or to create a proactive campaign that enhances the corporation's images. The key to the definition of a campaign is that it is created by an organization, such as a profit-oriented corporation, a political candidate, or a social agency, to communicate to a single small audience, such as employees within one office or to millions of persons in multiple audiences across the nation (Moffitt, 1999).

A public relations campaign cannot be assumed when news stories saturate the media covering a natural disaster or reporting a crisis that affects a corporation or an industry. For example, a flurry of news stories reporting the 2010 BP (British Petroleum) oil spill in the Gulf of Mexico or the Toyota sticking brakes crisis in the same year are not campaigns simply by virtue of receiving widespread media coverage. These represent only major news stories that are picked up by media outlets across the nation. However, when BP and Toyota began responding to the news reports with their own messages and explanations of the crisis situations, in essence, each company was conducting a campaign of strategically designed messages

calculated to diminish the crisis and restore their respective corporate images.

Three Elements Define a Campaign

Three factors identify a campaign and distinguish a series of news stories from a series of campaign messages developed by an organization. Also known as the conceptualization model of a campaign, the factors of (1) campaign situation, (2) nature of organization, and (3) traits of the targeted audiences or publics are the few, but crucial, elements that represent the conceptualization of a campaign.

Any campaign is prompted by a campaign situation, such as a crisis affecting the organization or a project developed by the organization. A negative or crisis event can prompt an organization to conduct a campaign to attempt to correct any damage done to persons and the environment and, additionally, to rebuild any damage to the image of the corporation that results from the incident. A proactive, positive project, such as giving additional benefits to the employees, sponsoring a fundraising campaign to benefit research into an illness or disease, or calling attention to domestic violence also demands a well-thought-out, strategic campaign to get the information out to the affected and interested populations.

The nature of the organization is also a factor in any campaign. As its name indicates, a for-profit organization exists on profits from sales of its products or services. A not-for-profit organization, such as a social agency, exists to raise funds from donors and to generate goodwill to benefit its social cause. Political candidates and the organizations

supporting them work to garner votes and financial support to successfully support their candidates. Understanding the various natures and characteristics of organizations leads to an understanding of the campaigns that each conducts.

The third and final element of a campaign is knowledge of and considerations of all the multiple respective audiences that relate to the organization, such as employees, stockholders, community residents, media, truck drivers, customers, activist groups, and competitors or the rest of the industry. Multiple factors enlighten and affect the campaign that an organization plans: consideration of each audience's traits as well as its needs; personality traits; dominant demographics; knowledge, attitude, and behaviors toward the organization; and all the other various images held of the organization. Campaign messages that are most effective are those that appeal to any or all of these traits in the targeted audiences.

Background knowledge of any organization, any campaign situation, and any or all targeted populations define an actual campaign from any succession of random messages found in the media. Knowing the role of each of these elements and how each of these factors affects the others leads to an accurate definition of a campaign and separates campaign communication from other kinds of communication.

Kinds of Campaigns

Not only do the three elements of the conceptualization model of a campaign—campaign situation, organization, and audience—identify campaigns, but these same elements also define types of campaigns. The most accepted conceptual classes of campaigns are commercial, political, and social issue. For each of these kinds of campaigns, the nature of the organization, the campaign situation, and the distinct traits of the audience inherently label and identify the choice of campaign.

The three kinds of commercial campaigns are marketing, advertising, and public relations. Marketing as a field of business was created first; its purpose is to place a company's product or service in the marketplace and, hopefully, carve a unique space and create a singular demand for the product. Advertising emerged from marketing communication as a more specialized and narrow kind of campaign; the singular purpose of advertising

messages is to generate interest in and sell the product or service of the corporation. For these campaigns, the organization is profit oriented, the campaign situation is product sales, and the important audiences are customers, potential customers, and retailers.

For the third kind of commercial campaign of public relations, the project or crisis campaign situation and the targeted audiences are radically different from those of marketing and advertising. In the field of public relations a myriad of campaigns are possible, given the potential for numerous project and crisis campaign situations and given all the other populations (besides customers and retailers) with whom public relations professionals must communicate. Public relations communication is exclusively responsible for crisis communication and corporate image management. This necessitates that public relations is responsible for all kinds of campaign situations outside of sales and for all the other populations outside of customers and retailers. For political campaigns, the common campaign scenario is based on getting a candidate elected or a piece of legislation passed. In terms of important populations, a political campaign obviously targets voters or constituencies and the media as primary audiences.

The final classification of campaign is the social issue campaign. Described as a campaign to benefit society or to benefit a social or charitable cause, it takes two forms. The social issue campaign is a campaign to attract followers and donors to causes, such as National Smoke-Out Day, various environmental campaigns, or the pro-life and pro-choice campaigns surrounding the abortion issue. The second kind of social issue campaign, which is gaining in popularity, is when for-profit corporations support a social issue campaign for altruistic reasons and for image management reasons. This second move for corporations to support social issues blurs the lines between a public relations campaign and a social issue campaign. The assumed definition of a public relations campaign is to foster positive images in all the various populations, but a profit-oriented corporation supporting social causes also makes it responsible for social issue campaigns.

CANADA, PRACTICE OF PUBLIC RELATIONS IN

In Canada, as elsewhere, public relations can trace its roots to activities that predate its emergence as a distinct occupation. For example, after French explorer Samuel de Champlain returned from his first voyage along the St. Lawrence and Saguenay rivers in 1603, he published a book about his exploits that was designed to lure settlers to Quebec.

However, it is in the promotion of immigration in the late 19th century, as well as in the education of immigrant farmers in agricultural techniques appropriate to their new homeland, that one finds the rise of public relations as a distinct profession in the public and private sectors. Established in 1892, the Department of Trade and Commerce became the second government department (after the Department of Agriculture) to place a significant focus on publicity activities.

The first government publicists made use of traveling exhibits, lectures, pamphlets, and advertising to promote Canada's agricultural, trade, and commerce interests in the United States and abroad. The federal government also sponsored visits to Canada by clergymen and farmers, then circulated their comments to more than a million citizens of Great Britain. In a grand gesture, they granted 160-acre parcels of free land to each of more than 30,000 Americans.

Development of Public Relations in the Private Sector

Similarly, immigration was a key factor in the rise of private-sector public relations. The railroads, especially the Canadian Pacific (CPR), were important government partners in attempting to populate the West. However, this cooperation was motivated more by political necessity than financial strategy:

Promoting immigration helped curry government support for various railroad subsidies, including large land grants. By the dawn of the 20th century, the CPR had turned its promotional efforts to tourism, using techniques such as press junkets, brochures, and in-house film production.

For its part, the Canadian National Railway (CNR) was a debt-ridden, half-completed system when the government nationalized it in the 1920s. To salvage the operation, the CNR president promoted his firm as a valuable service to Canadians by introducing traveling schools and medical teams to rural communities; the firm also launched a radio broadcasting network that eventually became the foundation for the Canadian Broadcasting Corporation.

Many of the early activities in the private sector centered on internal communication. For example, the Massey Manufacturing Co. of Toronto, a farm implements maker, established what has been recognized as the first true employee publication in North America, *The Trip Hammer*. It published monthly beginning in 1885.

Early public relations efforts can often be tied to industries threatened by regulation, if not outright nationalization. These industries developed public relations departments to foster supportive public opinion in the hope of stemming unwanted infringements on their freedoms. As early as the mid-1800s, for example, Quebec brewers employed a form of public relations to counteract that province's introduction of local options on prohibition; the scenario repeated in 1917 against similar restrictive moves.

Other early adopters of public relations included utilities, such as Bell Canada, which established a publicity department in 1914 shortly after ad hoc public relations helped derail proposals to nationalize telephone service. However, it has been suggested that the status of public relations at Bell ebbed once the crisis passed, a pattern that may have been true in other organizations as well.

In many cases, publicity emerged organizationally from in-house advertising departments; the hiring of ex-journalists also brought a public information orientation to marketing communications efforts. Among early journalist-practitioners were George Ham and J. Murray Gibbon of the CPR, John Yocom of British American Oil Co., Charles Fortier of Bell Canada, Yves Jasmin of Air Canada, and Toronto consultant Ruth Hammond.

The birth of public relations consulting firms is similarly tied to people with newspaper backgrounds. The first known Toronto agency was established in 1930 by James Cowan, who had worked at the *Toronto Star*. Publicity bureaus existed in Montreal prior to that time, but there is no reliable evidence regarding dates. Probably the oldest firm still in business, OEB International, was founded in St. Catharines, Ontario, in 1936, by newspaperman Louis J. Cahill, who continued working simultaneously as a journalist for some time.

While there was sporadic growth in the private sector through the Depression, it was not until after World War II that public relations came into its own in English Canada. Public relations experience in wartime propaganda gave communicators skills that could be transferred to the private sector and to new wars against social unrest and expanding regulation.

In French-speaking Canada, public relations blossomed by 1960, when the “Quiet Revolution”—in essence, a turn toward secular, civil society from the conservative, church-dominated society of the past—gave rise to a more consultative society. Local organizations found it advantageous to get their messages across, given more powerful media and the rise of government communications.

Today, public relations is routine within most private- and nonprofit-sector organizations of any size, and public relations specialists perform the same mix of managerial, strategic, and technical work as colleagues elsewhere. While some major public relations consultancies are independently owned, major international firms like Hill & Knowlton, Weber Shandwick, and Fleishman-Hillard have Canadian operations.

Development of Public Relations in the Public Sector

The government did little to develop public relations activities in departments other than Agriculture, Trade and Commerce, and Transport until the 1920s and 1930s, when the problems and opportunities of large scale migration into cities necessitated new social legislation. However, it was not until World War II that public relations activities in the Canadian government reached a truly large scale.

The history of public relations in the public sector is tightly bound to the rise and fall of central communication agencies. At the onset of World War II, the Department of National War Services established the Wartime Information Board to support Canada’s war effort and to facilitate inter-departmental information sharing. The board reported directly to the prime minister. At the same time, the war spurred the proliferation of information services across government. Another federal agency, the Bureau of Public Information, orchestrated speaking tours; produced articles, posters, photos, and films; and took over the printing and distribution of all government documents. The Wartime Information Board absorbed this agency in 1942. Following the war, distrust of central agencies led to the Board’s being renamed the Canadian Information Service (CIS). CIS died a quiet death after the government abandoned domestic activities and transferred the organization to the Department of External Affairs.

Despite the expression of skepticism toward central agencies, public relations services were expanding and thriving, and by 1944, the federal government employed 396 publicity officers. A classification system, established in 1946, set lower end salaries (IS-1) at \$2,400 and higher end salaries (IS-4) at \$4,500.

After a lengthy time lapse, the next major development in public relations occurred in 1962, with the establishment of the Glassco Commission on Government Organization. The war had made Canadians fearful of organizations with too much power or control. Reflecting this bias, the Glassco Commission recommended fragmentation of the communication function. The commission also declared the “right of the public to know”; called for communication officers to “inform” rather than “impress”; and criticized the large number of IS officers in the armed services, the volume of government press releases, and the use of the term *PR*. Commission members recommended the establishment of clear communication policies, guidelines, and training in public relations for government communicators.

After this report, public relations departments in government became known as “Information Services.” Despite the commission’s focus on the information function, members recognized the necessity for some government departments, such

as (1) Health and Welfare and (2) Energy, Mines, and Resources, to seek to persuade on matters related to the public interest.

Another benchmark in the history of public sector public relations occurred with the establishment of the 1969 Task Force on Government Information, chaired by D'Iberville Fortier. Reverting to earlier patterns, task force members championed the development of a central communication agency that could act as a reference center and technical adviser to departments, learn the views of Canadians on government issues and policies, and coordinate departmental resources (especially in crisis situations). The task force published its recommendations in a controversial document titled *To Know and Be Known*. Authors D'Iberville Fortier, Bernard Ostry, and Tom Ford called for the creation of a comprehensive and innovative communication policy that included selection standards and training requirements for public relations practitioners. They also argued that the directors of Information Services should sit on department management committees and report to the highest level of each department executive. In other words, they recommended that public relations should become a management function.

In 1970 acting on the task force report, the Treasury Board charged Jack Donoghue (then director of Information Services at the Department of Energy, Mines, and Resources) with developing a career path for IS officers, and subsequently, Donoghue gained Cabinet approval for a "Career Plan and Manpower Guidelines" (sometimes called the "Y" theory of IS careers) that upgraded and clarified the public relations function within government.

Also in 1970, the government made a second failed try at centralizing the communication function in the body of Information Canada, an agency that came under severe criticism from members of Parliament, government departments, and journalists. Information Canada ceased operations in 1976. Eric Miller wrote a report that explained its failure in terms of orphaned operational responsibilities, a weak and unclear mandate, a sensitive political climate in which everyone assumed a "big brother" mentality about Information Canada, lack of a clear constituency or clientele, lack of support from ministers with clout, isolation from

bureaucratic realities, harsh judgments by the media, and a dependency that came with a cost recovery budget.

Nonetheless, in 1977, shortly after the separatists took power in Quebec, the government made a third effort at establishing a central agency to coordinate public relations activities. The Canadian Unity Information Office (CUIO) had a clear mission: to contribute to the patriation of the Constitution and to foster national unity. To accomplish these tasks, the CUIO established sophisticated public opinion research and media monitoring systems to track constitutional and unity issues. Like its forerunners, the CUIO came under attack almost immediately for being a propaganda tool, partisan in mission and operations. And so the CUIO fell, within months of the conservatives coming to power in 1984.

The next significant development occurred when the Tories commissioned a management review of communications in 1987. As part of the review process, government undertook an occupational analysis of communication functions. They found that public relations specialists were acting as media liaisons, writers, editors, exhibition designers, speech writers, and other creative positions. Subsequently, Cabinet approved a series of decisions that formed the basis for the 1988 *Government Communications Policy*, authored by Assistant Secretary of Communications to Cabinet Mary Gusella, with the assistance of Paul Tellier (Clerk to the Privy Council) and Jack Manion (Assistant Clerk to the Privy Council).

This document was a key development, transforming the work of the government communicator into a strategic management function. The new policy required communication officers to research and analyze the public opinion environment, engage in planning, perform an advisory function, and manage communications. Public relations specialists across the government registered in a massive retraining effort to prepare for their new strategic roles and responsibilities.

The goals of the new communication policy were to set out basic principles of communication within the context of representative government, encourage transparency and the free flow of information between government and citizens, highlight the importance of communication in achieving government objectives, establish a

framework for government-wide management of communication, and provide guidelines for implementing a range of communication activities, such as advertising, publishing, public opinion research, and media relations.

The most recent incarnation of a central communication agency occurred in 1996 with the establishment of the Canadian Information Office (CIO), later renamed Communications Canada. The formation of this agency followed on the heels of the Quebec referendum—a referendum that came within two percentage points of dividing Canada into French and English entities. The federal response was decisive. With ministerial approval, the Treasury Board established the Corporate Identity and Government Communications Division in late 1998. The division had a twofold mandate: to brand the Government of Canada and to renew the 1988 *Government Communications Policy*. Jean-Pierre Villeneuve was appointed to head that renewal process.

Also in 1998, Assistant Secretary of Communications to Cabinet Ruth Cardinal steered a government-wide committee that created a vision statement for the communications community. That vision statement outlined the need for communicators in partnership with stakeholders to develop strategic and operational communication plans; implement communication plans, projects, and activities by using modern communication tools and techniques; evaluate and adjust communication plans and activities, as needed; and ensure a capacity to respond quickly and effectively to crisis situations. The committee also contributed to a competency profile for communicators, part of the Universal Classification System initiative undertaken by the Public Service Commission. The competency profile included categories related to knowledge, cognitive thinking abilities, interpersonal and partnering skills, and specialized and technical skills.

More than a decade after initiating its review of the 1988 *Government Communications Policy*, the Treasury Board issued a revised policy in April 2002. That policy document resulted in a greatly expanded definition of the government communications function. According to the policy, the job duties of communicators range from informing and serving Canadians to environmental analysis; public opinion

research; consultation and citizen engagement; risk communication; crisis and emergency communication; management and coordination; planning and evaluation; internal communication; Internet and electronic communication; media relations; involvement with public events and announcements; advertising; establishment of partnering and collaborative arrangements; marketing; publishing; and the production of films, video, and multimedia products.

Organizations

The two principal professional associations operating in Canada are the Canadian Public Relations Society (CPRS) and the International Association of Business Communicators (IABC).

CPRS is a federation of 14 locally based societies from Vancouver Island to Newfoundland. Its 2013 membership is listed as more than 1,800 members. Similar to the Public Relations Society of America, with which it is loosely affiliated, CPRS fosters the interests and professional stature of the field and offers its members professional development opportunities through chapter programming, an annual national convention, an online resource library, and so on. It has an accreditation program leading to the designation APR; nearly 500 of its members are accredited. CPRS was established in 1948, linking separate bodies in Montreal and Toronto.

IABC has a strong presence in Canada, with approximately 5,000 members as of mid-2012. Its largest chapter worldwide is in Toronto. There are 14 other Canadian chapters within its two Canadian districts—including a chapter in the Caribbean whose members determined that they had more in common with Canadian practitioners than with their more proximate U.S. colleagues. IABC members have access to professional development opportunities similar to those of its sister organization, as well as an accreditation scheme leading to the designation ABC (Accredited Business Communicator). Several of the association's world leaders have been Canadian. Both CPRS and IABC are members of the Global Alliance for Public Relations and Communication Management, founded in 2000.

Canada also has a number of organizations linking practitioners in specific industry sectors. These

include the Health Care Public Relations Association of Canada, with seven chapters; the Canadian Association of Communicators in Education, which embraces communicators from school boards, teachers unions, and provincial ministries of education; and the Canadian Council for the Advancement of Education, whose members are drawn from the postsecondary education sector.

Status

Just as in the United States, public relations in Canada is an unlicensed profession. In the 1980s, surveys indicated that up to 60% of practitioners supported mandatory licensing, a call echoed by several CPRS leaders, such as 1987–1988 president Allan Sinclair. Nothing came of these pronouncements, however, and public relations remains open to entry by anyone, though increasing numbers have taken some form of public relations education at the postsecondary level.

The 2001 Statistics Canada census found that 4,360 respondents listed public relations and customer service as their major field of study at the university level. The figure was based on a 20% data sample of those at least 20 years old with a university degree or degrees.

Educational programs in public relations appear most often in community colleges. The exceptions are programs at Mount Saint Vincent, the University of Ottawa (in cooperation with Algonquin College), l'Université Laval, and the University of Quebec at Montreal, which offer the opportunity to specialize in public relations within their communication programs. The University of Guelph, McGill University, the University of Regina, l'Université de Montréal, the British Columbia Institute of Technology, Ryerson University, and the University of Lethbridge (in cooperation with MacEwan University) grant diplomas or certificates in public relations. (These programs do not always fall under the aegis of communication.) Courses relevant to the study of public relations also appear within a number of communication and continuing education programs in Canadian universities, such as the University of Calgary.

Opportunities for graduate work in public relations are limited. Royal Roads University offers an MBA in Public Relations and Communication

Management. A joint program between l'Université Laval (Quebec) and l'Institut d'Etudes Politiques de Bordeaux (France) grants a diploma of graduate studies in Public Affairs and Lobbying.

There is some evidence that Canadian public relations practitioners enjoy about the same status as their U.S. counterparts. A 2002 survey by IABC, for example, shows similar rankings on such measures as job satisfaction, job security, and level of managerial responsibility. Indeed, to the extent that links to senior management are a marker of status, Canadian respondents reported somewhat greater access than Americans, and they were more apt to regard the reporting relationship as effective. The average salary of Canadian respondents in the IABC survey was about one-third lower than that of their U.S. peers, when adjusted to U.S. currency; however, they were no more likely to complain that their salary was too low for the number of hours they are compelled to work. As elsewhere, women in the field have increased in number. For example, CPRS membership in 1958–1959 was 13% female; at the turn of the millennium, the figure was 60%.

CAPTION/CUTLINE

A caption, or cutline, refers to those identifying words that appear beneath a photograph when it is used to accompany an article or to stand alone in a news publication. If a photograph accompanies an article, the caption or cutline should summarize the article, as the reader may rely only on the caption or cutline for information.

The intention is that captions or cutlines should be interesting enough to entice the reader to read the entire article. “Research repeatedly demonstrates that photographs with captions are most effective at increasing readership and understanding than news stories standing alone. Studies also show that news stories are more effective than photographs without a caption” (Morton, pp. 17–18).

Photographs can be considered among the most effective publicity tools. Single photographs with captions or cutlines are sometimes called “wild art” by editors. These are photographs that are taken with the intent to draw reader interest.

Captions or cutlines should identify all individuals who appear in a photograph from left to right. Be sure to include their titles and their involvement as they relate to the photograph’s purpose. Photograph consent forms should be obtained, especially for anyone under the age of 18.

Most often, public relations practitioners are responsible for writing captions or cutlines for their organizational newsletters or for photographs being submitted to the media. When submitting a photograph with a press release, or as a stand-alone item, submit the caption or cutline in press release format, including contact information. Write in the active tense and try to limit it to no more than three sentences.

Public relations practitioners may be responsible for taking photographs or directing a photographer at special events. Plan out the shots ahead of time by making a list of who needs to appear together in photographs. For example, if board members or staff members will be present in honor of a special guest, work to get these people together for a quick photograph during the event.

When directing or taking photographs, public relations practitioners should try not to have more than four individuals appear in each picture. Photographs that capture people in their natural state

as they are talking or looking at objects are preferred over those that are posed. Avoid, if at all possible, publishing (or taking) photographs of individuals who have alcoholic drinks in their hands or are smoking cigarettes to avoid any liability issues that could ensue.

CASE STUDY

The case study is a descriptive, qualitative research method that analyzes in great detail a person, an organization, or an event. Case studies are found in most applied areas, such as business, law, and marketing, and offer insight into practices and tactics. The case study’s major advantage is the detail and analysis it provides of a specific person, organization, or event; its major disadvantage is that it cannot be generalized to situations other than the one that was studied. A major problem in using case studies is the “it worked here, it will work for me” mode—that is, trying to take specific tactics or messages from one case and applying them to another. Even in situations where cases are within an industry, trying to compare Case 1 to Case 2 is like trying to compare apples to oranges.

Case Study Types

There are three major types of case studies common to public relations: linear, process-oriented, and grounded. The *linear case study* focuses primarily on the entity as the object of research from a historical perspective. Its function is, as Jerry Hendrix (1995) noted, a linear ROPE (Research,

Objective, Program, Evaluation) model. The *process case study* examined the object of research as a unique event within a larger process. As suggested by Allen Center and Patrick Jackson (1995), this case study type included feedback loops whereby campaign strategy and tactics can be revised or changed due to evaluation carried out against planned benchmarks. Both types are linked to some type of communication theory. The *grounded case study*, on the other hand, is crafted around a business objective and relies less on communication. Its function is to demonstrate the business principles in play and typically is based on some business model, such as Management by Objectives (MBO).

Conducting a Case Study

The actual application of any of the three case study types follows a historical review of a public relations campaign, specific event, institution, or person. As such, a case study typically follows a *timeline format* that focuses on the events leading up to, and then follows through to a campaign or event, or it chronicles the individual or institutional life. If the case study takes a problem-solution approach then the case is formatted based on causes and effects, typically following a deductive logic. Regardless of format, the case study usually includes a statement of the problem; a research phase; the goals and objectives of the campaign, event, institution, or person; the communication strategy employed (if employed); and evaluation.

All public relations case studies focus on some element or problem. Defining and stating the problem or element is the first step in conducting the case study. This is typically phrased as a problem, opportunity, or situation and sets the stage for the research phase. Case studies have been conducted on economic, political, environmental, and personal problems. For instance, the handling of the Clinton-Lewinsky affair might provide insight into how to handle a political problem on a personal level. A case study of Dell Computer Corporation might examine how the CEO influences public relations strategies and impacts the bottom line.

The research phase is an exhaustive review of all documents—published and unpublished—relevant to the case. The research phase may also include visits to sites, interviews with participants,

and interviews with representatives from other publics affected by the case. Although there may be interviews, most of the case study's efforts are found in historical research. Historical research tries to examine as many primary sources (original documentation) as possible in order to paint as complete a picture as possible of the case. This requires visiting libraries and other places where documents may be found. In many instances, the case study researcher has to travel to specialized libraries, such as the mass communication collection that houses John W. Hill's personal papers at the University of Wisconsin or the archives of the company or institution under study. The key is to obtain as much original material as possible. This data is followed up with secondary sources: newspaper articles, reports of various industries or the government, and so forth. For instance, in a crisis management case, the researcher might examine stock prices before, during, and after the crisis.

Based on this research, the case's goals and objectives are formally stated and then the communication strategy used to meet the goals and objectives is examined. At this phase of the case study, a content analysis of messages may be employed and key figures may be (re)interviewed. Here the researcher attempts to state specifically the campaign or individual goals and objectives and the benchmarks against which it will be evaluated. In addition, the actual communication strategy and the various written, visual, and verbal tactics employed are addressed. Many grounded, business-oriented cases do not offer great detail here, mainly because they are more concerned with a cause-effect model. In a linear model, the case progresses to the next phase, but in a process model the evaluation of benchmarks is presented and any revisions of strategy and changes of tactics explained.

Finally, the case study evaluates whether the objectives were met and the goals achieved. This is done by reexamining the problem, opportunity, or situation, the goals and objectives, the communication strategy, and the tactics and comparing them against either the benchmarks or some other criteria that provide indications of success or failure. Given the advantage of hindsight, suggestions for improvement may be offered for objectives and goals not met as well as a critical appraisal of output tactics offered.

Importance of the Case Study

Case studies provide public relations practitioners with examples of good and bad public relations tactics. In some instances, a case study provides insight into how a public relations firm operated, such as Karen Miller's case study of Hill & Knowlton. Others might provide insight into how public relations was not employed and the impact of that failure, such as James O'Rourke's Ford Motor Company versus Firestone. Each provides the practitioner with examples of successful and unsuccessful strategy and tactics.

CATALYTIC MODEL OF ISSUES MANAGEMENT

The catalytic model of issues management explains how organizations can proactively initiate certain issues and stimulate the public agenda with the goal of managing an issue through its life cycle. Richard E. Crable and Steven L. Vibbert (1985) extended Barry Jones and Howard Chase's (1979) process model of issue management by proposing a catalytic model that maintains that organizations should not merely respond to developing issues

and react to the strategies of others but should instead catalyze issue discussions as a means to achieve organizational goals.

The catalytic model segments issues into life cycles with five stages: (1) *potential* stage, when one or more individuals attach significance to a problem; (2) *imminent* stage, when many others accept a problem as a legitimate concern; (3) *current* stage, when the media widely disseminate information about an issue, making an issue a topic of conversation among many stakeholders; (4) *critical* stage, when an issue is ready for decision and groups argue for a resolution in their favor; and (5) *dormant* stage, when policy decisions on an issue have been made or an issue is "resolved." Issues often resurface when new problems are identified, in effect restarting the issue life cycle again, at various stages.

The catalytic approach argues that organizations should not wait for potential issues to become salient to others to start managing them. There are three steps in catalytic issues management.

Situation Assessment. Issue managers need to take stock of potential outcomes that benefit profit or survival motives of the organization. Managers should examine how environmental conditions enable or constrain desired outcomes.

Goal Establishment. Organizations catalyze favorable policy by creating issues and effectively managing them to a desired outcome. Desired outcomes should be solidified into clear goals and objectives. Managers should identify what law, policy, economic, cultural, or informational factors need to change in order for organizational goals and objectives to become reality. Subsequently, managers should assess the potential positive effects of a change against potentially negative effects. If the potential positive effects outweigh the negative, managers determine if the organization can indeed catalyze the desired change through influencing the policy process.

Agenda Stimulation. An organization can work to establish an issue's potential with internal and external publics through tactics that explain the issue as justified and legitimate. Moving an issue to the imminent stage is accomplished by gaining the involvement and endorsement of other groups so

that an issue becomes legitimized in the eyes of many stakeholders. Next, through agenda-building techniques and media relations, issue managers try to position and frame an issue in the mass media, helping it to reach the current stage and become part of the public agenda. In the critical stage, skills such as lobbying are needed to influence public policy and resolve an issue in a manner that benefits the organization.

As a long-term planning tool, the catalytic model enables organizations to initiate desired issue discussions rather than waiting for others to develop trends or favorable policy conditions. While initially conceptualized as a tool for business, research has widely recognized that all forms of organizations—corporate, government, non-profit, or activist—can catalytically manage issues to their advantage.

CAUSE MODEL OF RISK AND CRISIS COMMUNICATION

The CAUSE model is an approach to studying risk and crisis communication. Inspired by Lloyd Bitzer's (1968) concept of the rhetorical situation, this model assumes that situations where people are communicating about hazard or threat are beset by predictable tensions. Katherine Rowan (1991, 2009) and associates argued that these tensions are suggested by components of all human communication (i.e., sources, messages, topics, channels, and contexts) and indexed by the letters in the word, CAUSE. When people communicate about

an uncertain danger, a lack of trust or *confidence* is likely. Often there are challenges in gaining *awareness* of danger. Third, even when awareness exists, deep *understanding* of the harm may not. Fourth, because risk and crisis communication situations involve matters where people disagree, there is a need to build *satisfaction* with solutions. Finally, because such situations involve motivating people to move from merely agreeing that some behavior is a good idea to acting on that belief by, for example, locating the exits in a theater, *enactment* is often crucial.

Research on these five tensions and steps for managing them is available in fields, such as communication, psychology, disaster sociology, political science, management, and decision sciences. Scholars and practitioners use the model by asking, in the context studied, what is the *principal* tension or obstacle and what steps reduce that tension?

For example, in 2012, the Metropolitan subway in Washington, D.C., stopped systemwide for 30 minutes on a hot summer Saturday. Temperatures climbed in some cars; occupants began to feel ill. Some riders were tourists who did not know they could contact the train operator through an intercom to report their discomfort. After this event, officials said the stoppage occurred because of a hardware problem and that since their computers are on a “closed loop” system, they were not vulnerable to cyber attack.

To use CAUSE to analyze this situation, one might ask: Did officials' statements earn *confidence*? In many risk and crisis situations, earning confidence is the most difficult step. Were Metro riders sufficiently *aware* of their options if the temperature in their compartment became unbearable? Research shows that people have trouble detecting slow onset problems, such as slowly increasing heat. Did stakeholders *understand* the statement that the computerized system running Metro is a “closed loop” system? Is it the case that closed-loop systems are not vulnerable to cyber attack? Were riders and officials *satisfied* with management of this incident? Will riders continue to use Metro? This final question is raised by the *E* for *enactment*.

After considering such questions, one can determine which tensions were most severe and identify steps to address them. The CAUSE model has been used to explore communication challenges

concerning hazardous chemicals, carcinogens, agricultural biotechnology, terrorism, and emergency preparedness.

CAUSE-RELATED MARKETING

Cause-related marketing links a product or a company to a charitable cause. The funds that are donated to the charitable cause usually come from a portion of the sales of the product. For example, when a person buys cosmetics from Avon, a portion of the sales profit is donated by Avon to support the breast cancer research cause. In this way, cause-related marketing is an indirect form of corporate sponsorship. It is often used as part of an integrated marketing campaign since it relies on advertising as well as public relations.

The concept of cause-related marketing was first pioneered in the early 1980s. One of the first companies to use it was American Express when the company linked its marketing campaign to the refurbishing of the Statue of Liberty. A portion of profits from credit card use was donated to the Statue of Liberty Fund. Use of the credit cards increased because customers felt they were making a contribution to the cause.

The purposes of cause-related marketing are twofold, and the two purposes must be balanced for the marketing effort to be effective. The first

purpose, of course, is to increase sales. The second purpose should be a socially responsible effort on the part of the company to support a cause and to be a good corporate citizen. When the second purpose is sincere, the first—sales—is better served.

If cause-related marketing is strategically designed, it can be an effective marketing tool that can increase media exposure, help a product cut through media clutter, increase sales by adding an additional benefit to the purchase of a product, and increase the chance of reaching specific audiences. A survey of 2,000 adults in the United States by Cone-Roper found that 78% said they would be more likely to buy a product that supported a cause in which they believed. A little more than half (54%) said they would pay more for a product that supported a cause they cared about, and 66% said they would switch brands to support a cause.

To use cause-related marketing strategically, a company must understand what charitable causes appeal to the customers the company is trying to attract and, at the same time, find a cause that is a good fit for the company and the product. There must be a logical connection between the cause and the target market for the product, the cause must be relevant to the consumers, and equally as important, there should be a logical and strategic connection between the vision and values of the company and the cause. And finally, the relationship needs to show long-term commitment to the cause.

An example of a company that has used cause-related marketing effectively is Avon. Avon's "cause," breast cancer research and related support efforts, is a good fit for the company, the product, and the consumers. Part of Avon's mission statement reads, "Our dedication to supporting women touches not only beauty, but health, fitness, self-empowerment, and financial independence" (www.avon.com). The Avon Breast Cancer Crusade matches the vision and values of the company. It also has an identifiable link to the product—cosmetics—that makes women feel good about themselves. Additionally, the company has shown long-term and genuine commitment to the cause. The Avon Foundation was established in 1955, and in the last 10 years has raised more than \$250 million for breast cancer research, education, early detection programs, and clinical care and support services for women. The Breast Cancer

Crusade is clearly identified and associated with Avon and Avon cosmetics.

One definition of public relations is “doing good and getting credit for it.” For cause-related marketing to have maximum benefits for a company, information about the cause must be integrated into as many elements of the communication efforts of the company as is possible and appropriate. It is not enough to have a cause; the cause must be communicated to the customers. For instance, Avon integrates the pink ribbon—the breast cancer awareness symbol—into most of its advertisements and public relations campaigns. In some cases, whole-page advertisements are used for image and advocacy advertising, promoting the Avon Foundation Breast Cancer Crusade rather than for advertising its products and cosmetics. In product ads, information about the crusade is included, and information about the Breast Cancer Crusade is also prominent on the company’s website and is included in product packaging.

When there is a good fit among the cause, the customers, and the company, the company’s image is enhanced and the customer feels good about the product purchase. An emotional element is added to the relationship between the company and customer, which can help position the company in the customer’s mind and differentiate it in a positive way from the competition. It can help make the company seem less “commercial” and more socially responsible.

A word of caution: If the cause is not consistent with the company or product’s image and does not seem logical for a particular company to promote, or if the cause is not relevant to the target consumers or is not well communicated, then cause-related marketing is useless as a way to increase sales. Furthermore, if the commitment between the company and the cause does not appear to be long-term and genuine, cause-related marketing can backfire. Cone-Roper conducted a survey and 58% of the people surveyed think that cause-related marketing is done only to improve the image of the company. The perception that a company is using cause-related marketing to be self-serving rather than altruistic can result in decreased sales.

CHAOS AND COMPLEXITY THEORY

Chaos theory replaces the common usage of chaos as a state of confusion and disorder with the more structured sense of the concept as movements between order and disorder that, over time, are only apparently haphazard. It provides, sometimes supported by mathematics, guidance that can structure certain disorderly looking, dynamic, and nonlinear systems (i.e., where outputs are not directly proportional to inputs).

Weather, for instance, is a dynamic system; it is difficult to predict and nonlinear in that many consecutive days of sunshine can be succeeded by a sudden storm. However, since 2007 meteorologists have a 95% accuracy record in 3-day forecasting of global weather and earlier weather research stimulated a wider interest in chaos theory. While running computer weather predictions, meteorologist Edward Lorenz found that seemingly trivial rounding differences in input data led to huge variations in outcome forecasts. He popularized his research by asking, “Does the Flap of a Butterfly’s Wings in Brazil Set Off a Tornado in Texas?” and his findings, on the need to be sensitive to initial conditions and to be aware of the possibilities of disproportionate outcomes, fused into the term *the butterfly effect* and stimulated widespread research into tremendous changes arising out of tiny variations. In public relations, chaos theory was first applied to such unpredictable matters as issues, risks, and crises.

Chaos theory is complemented by complexity theory. Both form part of the so-called sciences of uncertainty and share orientations relevant to wider public relations practice and research. Both, for example, foreground the loss of control by

conscious entities, which is a recurring feature in crises and news releases; both acknowledge persistent unpredictability, which relates to adaptability in mindsets and tactics for addressing turbulent change (e.g., radical media restructuring); and both work with nonlinear behavior, which can massively influence everyday activities from event management to investor relations. Both also contribute to the management trend away from imitating the traditional sciences of certainty that motivates the search for measurable behavioral prescriptions for managers to deliver universally predictable outcomes. Instead, they approach organizations and societies as complex response processes in which people engage in multiple communication interactions culminating in collective actions that they may not have intended.

Accordingly, although possible parameters for activist publics and corporate crises can be outlined, neither the result of the activities of the former nor the unfolding events of the latter can be completely controlled or predicted. This sets limits on how much public relations—an organization-centered and purposeful process ostensibly able to strategically manage communication and its outcomes—can succeed. It implies that practitioner claims for assured outcomes should be modest. More positively, complexity's identification of key intervention moments and phases of change in other uncontrollable real-life situations offers pointers on how to reduce, and respond to, disorder in public relations. Its theories liberate practitioners to adjust overly rational management approaches, such as adherence, to plans based on earlier risk uncertainty with contextual awareness and history-sensitive knowledge. Complexity foregrounds the potential for those experiential assets to be effectively combined with the patience to watch and wait for the right moments to act (i.e., where intervention can have large effects). This may involve shifting between spells of smart surrender, and doing virtually nothing, and periods of intensive intervention. Well-timed actions can leverage accumulated local knowledge and assist real-time responses to specific events and agent behaviors, and so achieve more than the preprepared rationale and sustained proactivity.

Complexity theory can be defined as the study of how such actions can emerge, often without planning or central command, from the collective

and self-organizing behavior of relatively basic units, adaptive agents. This is relevant to public relations beyond already existing research on issues, crises, risks, and challenges to reputation. Searching for patterns in nature and change in local interactions between many agents, complexity examines how they can spontaneously produce order, or distinctive patterns, that cannot be predicted either from inputs or from existing environments. Often agents in complex adaptive systems operate around a few simple rules. In business, this may be akin to how two early Google commitments—to producing the best search engine in the world and to following the informal motto: “Don't do evil”—helped take the company from nowhere to the forefront of business.

Beyond business, major contemporary challenges (e.g., epidemics, terrorism, and other risks) involve complex systems challenges; each one has to be met by anticipating and engaging diverse, adaptive entities, whose acts are interdependent. Feedback, or the potential to modify a system's process by that system receiving information about its impact in real time, is central to these interactions. Feedback is nonlinear—think of the immediate screech of a loudspeaker system prior to being adjusted to human hearing—but contributes to adaptation and learning as the system discovers the effects it is producing. From a complexity perspective, feedback informs the system in ways that foster co-creation and virtually continuous self-modification and helps build self-organizing capabilities.

Public relations is currently coming to terms with feedback from self-organizing social media groups that often co-create meaning and coalesce, especially via networks, into powerful players in public opinion and knowledge formation. Wikipedia illustrates how knowledge has moved outside the sphere of limited groups of experts—whether academics, media pundits, or subject specialists—and toward ordinary people. Through the Web these people gain more public trust than expert views and spokespeople pronouncements, and this new phase in the environment impinges on public relations, notably through the blogosphere. The speedy and largely unsupervised feedback processes in the emergent phenomenon of blogging, and its large-scale citation by conventional media, have established it as an economic and social force.

Analysts estimated that the United States had over 20 million bloggers by 2009, with almost 2 million profiting from their work, and almost half a million using blogs as their main source of income.

The role played by public relations practitioners in funding bloggers can distort feedback in favor of their clients in the short term, but at the risk of losing reputation in the medium term, and destroying trust in bloggers as sources altogether in the long term. This is especially true if funding is not transparent; openness of any kind influences the behavior of the agents involved. Agents can be animate, as with stock investors, or inanimate, as algorithms programmed to adjust investments automatically on selected share price movements. In studying how such agents adapt and co-create new states, complexity theorists seek consistent processes, such as emergence, and patterns in all kinds of unrelated complex systems, such as how birds flock, how civilizations rise and fall, and how disciplines evolve and decline. Along these themes, complexity-influenced work has examined interactions between public relations, marketing, and network theory.

As the vocabulary of adaptation indicates, complexity frequently draws metaphors and models from biology and evolution. As a result, just as an ecosystem is greater than the sum of its flora and fauna, complexity researchers look at an organization as a complex adapting system evolving to a whole greater than the sum of its computers, personnel, and premises. In these emerging institutional systems, which are both shaping and shaped by the interplay between buildings, language, and workforces, evolutionary discourse impacts on perceptions and feeds into practices. Biological imagery helps restore the meaning of managing as the sense of coping with, rather than controlling, uncertain environmental conditions. Companies may set margins for return on investment (ROI), but ROI remains vulnerable to co-creation, with agents as fragile as consumer whims and algorithm-generated share-buying.

The business equivalent of evolution's survival-of-the-fittest, or most adaptable species, is sustainable organizational success, which also emerges through coevolution. Dominant coalitions, politicians, and media all constitute interacting parts of organizational systems. Nevertheless, they are just parts, and all are highly sensitive to public opinion,

its interplay with government regulation, and its mediation by public relations. The ramifications of the 2011 British phone-hacking scandal surrounding Rupert Murdoch's News International demonstrate how the interdependence of agents around trust can escalate a crisis across continents. Complexity thinking also suggests that Murdoch's family-heavy board lacks the diversity needed for the media empire to fit a contemporary landscape that is global, diverse, and increasingly transparent. Again drawing from biology where species experiment by blending competition and cooperation between different agents to create innovation and responsiveness, complexity thinking offers diversity lessons to public relations as well as media moguls.

In terms of methodology, chaos and complexity prefer prototypes, provisional trials, and computer-generated experiments or simulations. Rather than setting plans, they emphasize flexible preparation that combines loose prescribing for unknowable contingencies with fast, real-time adaptation by many diverse participants. In general, they lend encouragement to continuous learning from experience, and complexity-influenced public relations theorists argue specifically for deploying action learning, action research, inclusive dialogue, and scenario testing. The shift suggests that provisional approaches better accommodate conditions of volatility and better align with the post-command and control, and post-symmetry, views. These views acknowledge that stability is provisional rather than permanent and is not a desirable end goal for living systems since they risk becoming inert or even extinct. At times, complexity thinkers have advocated deliberate disruptions so that an "edge of chaos" situation can stimulate innovation.

The chaos and complexity emphases on fast adaptation suit present day conditions of rapid and unprecedented change because there is no reliable evidence base for forecasting futures and predicting risk manifestation. In engaging with contemporary shifts between states of order and disorder, these two sciences of uncertainty have a consistent logic. As well as local responsiveness to changing environments, that logic follows from their commitments: to learn from feedback, even when it is painful; to surrender illusions of control, even given the messy co-creation involved in diverse, intelligent, and wide participation; and to deal with the

unpredictable, even if it is nonlinear. They also open a space for transformational change because, although linear progression can produce much-modified caterpillars, only nonlinear pathways allow for the unexpected suddenness of butterflies.

CHASE, W. HOWARD

W. Howard Chase is best known for coining the term *issue management*. A man of unique intellectual and experiential depth, Chase argued for the following statement as the official definition of the Public Relations Society of America (PRSA) in 1947: “Public relations is an operating philosophy that integrates the corporation into the daily lives of the people it serves” (Crane, 2003, p. 49). With this line of reasoning, Chase was one of a few leaders who recognized that constant change and innovation

were necessary not only for how people practiced public relations but also for how the profession was defined. As businesses were sharply criticized during the turbulent 1960s, he was primed to demand more responsiveness and leadership from practitioners and helped revolutionize the practice in many ways during the 1970s and 1980s.

A Phi Beta Kappa cum laude graduate of the University of Iowa, Chase received the Sanxay Award granted to “the outstanding senior who gives promise of achieving the highest career.” Postgraduate studies included the London School of Economics and Harvard University. Dongguk University in Seoul, Korea, the largest Buddhist university in the world, awarded Chase an honorary doctoral degree in economics. He taught at Harvard-Radcliffe, Drake University, New York Polytechnic Institute, The George Washington University, and the Graduate School of Business Administration at the University of Connecticut, where he introduced the first course ever offered on issue management.

As the first chair of the Executive Committee of PRSA, Chase was one of many leaders of the profession who helped to found this organization of working professionals. Chase twice received the PRSA’s Gold Anvil Award for “distinguished professional proficiency.”

Chase’s corporate service as officer or director included American Can Company, General Mills, and General Foods. In 1951, Chase assumed the post of political public relations director for U.S. Army Gen. Dwight Eisenhower, in charge of all Republican National Convention arrangements for Eisenhower’s presidential nomination in 1952. Subsequently, he served as assistant secretary of commerce for the initial Korean War mobilization. He also served as deputy administrator for the Office of Defense Mobilization under Charles Wilson, Lucius Clay, and Sidney Weinberg. He served as a trustee at Wellesley College, Sarah Lawrence College, and Mannes College of Music in New York City.

In 1962, Chase created the Council for Management of Change, with the monthly newsletter, *The Innovation and Management of Change* (IMC), as an incubator of his ideas. The newsletter’s thesis was “The principle of responsibility of senior executives today is the successful management of change itself.”

In 1976, he coined the term *issue management* as part of a robust discussion centering on the question: How should management respond to the deep and wide criticism being heaped on corporate America during the 1970s? With the publication of his 1984 book, *Issue Management, Origins of the Future*, Chase presented his signature comprehensive approach to strategic issue management. He defined the new field's objectives, in the debut edition (April 15, 1976) of the newsletter *Corporate Public Issues and Their Management* (CPI), as follows: "to introduce and validate a breakthrough in corporate management design and practice in order to manage corporate public policy issues at least as well or better than the traditional management of profit center operations" (Chase, 1976, n.p.). That same year, the Institute for Public Issues Management, of which Chase was founder and director, in cooperation with the Graduate School of Business at the University of Connecticut, sponsored the first of a series of seminars on issue analysis and techniques for corporate reorganization of public policy functions.

The first Issue Management Process Model, developed by Howard Chase, Barry Jones, and Teresa Yancey Crane, was published in 1977 in a special edition of CPI. (See also Jones & Chase, 1979.) The Public Affairs Council, under President Raymond L. Hoewing's leadership, held its first issues management conference for corporate public officers in 1977, and Chase was a presenter at what has since become an annual event. The Chase Award for Excellence in Issue Management, named in his honor, is annually bestowed by the Issue Management Council.

Speaking as cofounder and chairperson of the Issues Management Association in 1982, Chase offered the following widely quoted definition: "Issue management is the capacity to understand, mobilize, coordinate, and direct all strategic and policy planning functions, and all public affairs/public relations skills, toward achievement of one objective: meaningful participation in creation of public policy that affects personal and institutional destiny" (1982, p. 1). Chase stressed the proactive aspect of issues management that "rejects the hypothesis that any institution must be the pawn of the public policy determined solely by others" (1982, p. 2). In 1984, Chase defined issue management as issue identification, analysis,

change strategy options, action programming, and evaluation of results.

An issue change strategy option is a choice among carefully selected methods and plans for achieving long-term corporate goals in the face of public policy issues, a choice based on the expected effect of each method of employment, cost, sales, and profits. (1984, p. 56)

Action programming entails the use of resources to gain the strategy option selected.

Chase passed away on August 19, 2003, in Stamford, Connecticut. In his address as PRSA president in 1956, he advised practitioners to realize that their profession entailed more than competent or even excellent communication skills. Their profession required that they be counselors to help their employers and clients to more completely win the public's approval by deserving that approval.

CHASE MODEL OF ISSUE MANAGEMENT

The Chase model of issue management is the original attempt to explain the “new science” of how organizations can and should respond to significant public issues. Developed along with colleague Barrie Jones, W. Howard Chase used the model to feature five key steps: issue identification, issue analysis, issue change strategy options, issue action programs, and evaluation of results. The assumption of the model is that instead of acting as passive reactants to the interests of advocacy groups, corporations can and should use their discourse as an organizational resource, in the same way that they deploy technology, capital, and human resources.

Chase asserted that the tracking of issues and the organizational response to those issues should be systematic to elevate the public relations function of the organization from an auxiliary enterprise to the strategic management level. Early examples of major issue management campaigns include those by the then Mobil Corporation in the 1980s, which offered “observations” about technology, conservation, and government regulation, as well as a campaign by the Insurance Information Institute in the 1990s as a public policy response to the so-called lawsuit crisis.

Issue Identification

The first stage of the Chase issue management model is issue identification. This stage seeks to identify trends, which might become issues. An issue conversely is a matter that is ripe for a public policy decision. Here a futurist research approach is taken toward issues that may affect an organization. Chase recommends that issues be classified according to their type (e.g., social, economic, political, technological), impact and response source (e.g., business system, industry, corporation, subsidiary, department), geography (e.g., international, national, regional, state, local), span of control (e.g., noncontrollable, semicontrollable, controllable), and salience (e.g., immediacy, prominence). As such, since it is impossible to manage every issue, a company must develop a process by which it can monitor any and all related issues.

Issue Analysis

The second stage, issue analysis, involves the application of theory and research to analyze the identified trends and issues. Here social, economic, and political trends are analyzed in an effort to understand which will develop into issues. The use of quantitative (e.g., public opinion surveys, content analyses) and qualitative analysis (e.g., statements by opinion leaders) helps aid the process. The point of such analysis is to use this data to make judgments about issues and set priorities to aid in determining which issues warrant a response.

Issue Change Strategy Options

Issue change strategy options, the third stage of the model, describes an organization’s choices about how it responds strategically, using communication as an organizational resource in order to manage an issue to public policy resolution. Chase reviews three issue stances typically taken by organizations: reactive, adaptive, and dynamic. The reactive approach is best characterized as stonewalling. An adaptive approach indicates an openness to change that seeks to offer accommodations as an organization seeks to participate in final public policy decision making. The third approach, and the one advocated by Chase, is a dynamic approach that shapes the resolution of a public policy issue by defining it in such a way that it realizes a resolution in terms that are favorable to the organization.

Issue Action Programming

In the fourth stage, Chase advises management to formulate a company policy to support its change strategy and operate an issue action program. Here, an organization begins with a strategic goal and specific program objectives. It then allocates and coordinates financial and human resources toward the project, determining which information resources are utilized and what messages are communicated through media to specific target audiences. Chase recommends using tracking surveys to determine if a campaign is working to create the desired response and acknowledges adjustments may be necessary.

Evaluation of Results

In the final stage, Chase advocates that such programs must be evaluated systematically. Here an organization must ascertain whether the campaign met its objectives as well as evaluate the performance of program managers. Ongoing monitoring of social, political, and economic changes is also recommended.

Conclusion

It is challenging for an organization to manage an entire public policy issue on its own. While it is difficult to measure the success of issue management, other justifications for engaging in issue management are the positive effects that these efforts have on a company's image as well as the support that issue campaigns are able to build with strategic constituencies who might be needed at a future date.

The long-term effect of the Chase model of issue management cannot be underestimated. It created a whole subset of public relations activity and study, and it helped elevate the role of communication-based public relations activities in organizations. While Chase initially articulated it in terms of corporate objectives, its application to institutions and other organizations is well recognized.

CHAT

Online chat is the synchronous, interactive, real-time exchange of messages via a mediated source. Traditionally chatting is conducted in “chat rooms” where multiple users engage in text-based conversations about topics of interest (e.g., music, television, sports, dating). With technological advances, video chatting, which allows participants to be seen and heard, has become popular. Some chat rooms provide video chatting capabilities for users who have Web cameras, or users can engage in video chatting with selected others via services, such as Skype, Yahoo Messenger, or Google Talk. Mobile telephones and handheld devices, such as iPads also offer video chatting capabilities.

In one of the first articles to discuss public relations' use of the Internet, including chat rooms and other platforms, G. A. Marken (1998) recognized the opportunities, dangers, and possibilities of chatting for organizations. Marken advised practitioners to stay informed about new technologies, as well as the need for organizations that use resources, such as chat tools to be vigilant about monitoring comments made by clients. This advice is even more relevant for organizations today as chatting continues to be an increasingly important real time organization–public communication tool. For example, the Public Relations Society of America annually holds weekly chats with members on the state of ethics in public relations during September, which it recognizes as “ethics month”.

There are also negative consequences associated with online chat participation. Because chat participants typically present themselves as socially desirable, misrepresentation is common and can range from exaggerating an aspect of one's physical appearance, such as height, weight, or attractiveness, in text-based chats to pretending to be someone else completely for more nefarious purposes. Further, incidents of harassment, from cyberbullying to terrorism, are on the increase in online forums. Research indicates that individuals who participate in high-interactivity social interactions, such as online chat, have significantly reduced face-to-face interaction with family members and friends, hobby group participation, telephone interactions, and television viewing.

These behaviors can have negative implications for practitioners because the ability to build authentic relationships is impeded. Crises occur when public relations agency and corporate department personnel engage in misrepresentations. For instance, some agencies have their own representatives post favorable comments about a client's product or service; however, because the representatives do not clearly identify themselves as such, the posts appear to be written by unbiased, third-party users. Such falsehoods are not only unethical, but potentially harmful to relationships and reputation.

The technology used to allow chatting has been around for decades. The earliest instance of synchronous communication was the 1960's TENEX system, which linked two terminals that allowed text typed into either terminal to appear on both. In 1968, the Advanced Research Projects Agency (ARPA), under the U.S. Department of Defense, created ARPANET, a network that became the foundation for the Internet. The introduction in 1974 of transmission control protocols (TCP) and Internet protocols (IP), the rules (protocols) that deliver data between computers, expanded the network to more users.

In 1988, Internet relay chat (IRC) was introduced and allowed multiple participants to chat via connections between servers. Early IRC users faced issues of compatibility, network congestion, slow connectivity, and rudimentary design of the chat features. In 1997, America Online's instant messaging system (AIM) revolutionized chat room usage and allowed access across wide and varying audiences. Although IRC exists on a much more limited scale today, direct website links and greater accessibility to video chatting provide more popular chat options.

Online chatting is popular. Beyond prevalent social uses, such as entertainment, online dating, social support, and gaming, online chat is becoming a common method for providing real-time customer service. Chat functions are also used frequently in education, business settings, by Diaspora and expatriates, and by the aid community, in order to allow interaction among geographically disparate individuals and groups.

CHINA, HONG KONG, AND TAIWAN, PRACTICE OF PUBLIC RELATIONS IN

Along with Brazil, Russia, and India, China has become one of the world's most rapidly developing markets. Its growing economy is creating new public relations opportunities and challenges within and outside its borders, thereby rousing worldwide interest in China's emergent engagement with the public sphere. These challenges and opportunities constitute the history and status of the public relations practice, professional associations, and public relations scholarship in mainland China, Hong Kong, and Taiwan. Discussion of public relations in Greater China focuses on the nature of Chinese business practices and the forms these practices take within a society noted for its traditionalism and its association of anticapitalist ideology with the West.

Mainland China

Systematic public relations practice began in mainland China during the late 1970s, coinciding with developments in state policy that fostered a greater level of public interaction with private institutions. The "Opening policy" in 1978 had a major impact

because the Chinese government elected to open its country to outside stakeholders; since then, according to Wu, Lin, and Guo (2001), the Chinese economy has transformed into a market-based socialist economy as joint ventures and wholly foreign-owned enterprises established public relations departments. In 1985, Shenzhen University established the first public relations program in higher education, noted Yu (2006). Wu, Lin, and Guo (2001) reported that international public relations companies, such as Hill & Knowlton (1984) and Burson-Marsteller (1985), entered the Chinese market, bringing with them international professionals and standards.

The renewed economic reform policy, declared in the 14th Communist Party of China National People's Congress in 1992, set the stage for countless new business ventures in China and radically shifted the country from isolationism toward development of one of the largest markets in the world. Major events, such as the World Trade Organization accession in 2001, the Beijing Olympics in 2008, and the Shanghai World Expo in 2010, contributed to the advance of public relations practice in China. Moreover, mainland crises rippled through China and influenced public relations practice. From the Asian financial crisis in 1998, bird flu outbreaks in 2001, SARS crises in 2003, and the Wenchuan earthquake in 2008, to the more recent food safety crises, public relations has played a critical role in Chinese life, both public and private. These disasters contributed directly to the creation of new public relations strategies in branding communication, business marketing, crisis management, and risk communication. In geographic terms, the profession expanded rapidly during this period from south to north and from the east to west of China. By 2008, Jiang was able to note that three thousand local public relations companies had been founded across the mainland. Correspondingly, professional organizations and qualification systems also emerged to cope with the new development and resulting challenges.

The 2011 annual survey released by the China International Public Relations Association (CIPRA) estimates that the size of the mainland public relations market amounted to 26 billion RMB (US\$4.1 billion) in 2011, with an annual growth rate of 23.8%. Public relations in the mainland primarily focused on the automotive,

healthcare, and financial industries, as well as information technology (Chinapr, 2012). Recent years have witnessed a significant increase of governmental and nonprofit organizational public relations. Furthermore, interactive communication patterns, such as instant messaging (IM), bulletin boards (BBS), microblogs, and strong government and nongovernment digital initiatives have contributed to making the Internet a major forum for public relations (Chinapr, 2012).

The salary satisfaction survey of the public relations industry in China reported that of the 2,658 practitioners who participated, most are from Beijing, Shanghai, and Guangzhou (17PR, 2011), 60% are females, and around 200 are younger than 29 years of age. In the first half of 2011, 80% earned more than 3,000 RMB (US\$473) as their monthly salary. The average income is around RMB 5,600 (US\$882), and the pretax average annual salary is around RMB 67,200 (US\$10,000). The staff turnover rate is 30% and nearly half of the public relations staff works over 45 hours per week, which indicates that public relations is labor-intensive work.

Two major professional associations operate in mainland China. The China Public Relations Association (CPRA), founded in 1987, is the industry's official representative in China. The Chinese International Public Relations Association (CIPRA), established in Beijing in 1991, is a national organization that aims at international cooperation among public relations organizations. CIPRA is mainly responsible for the national vocational qualification certificate system used in China. It publishes two magazines, *Public Relations World* and *International Public Relations*. Each major province or city has its own independent branch. For example, the Shanghai Public Relations Association (SPRA) is the earliest established public relations association in China.

H. L. Dong's (2008) research found that public relations is one of the most popular programs in universities. According to Dong, in 2008, 92% of mainland universities offered courses in public relations. Among them, 14 universities offered undergraduate degrees, 18 universities offered master's degrees, and five universities offered Ph.D. degrees in public relations. The courses are mainly set up under the disciplines of communications, management, and sociology.

Hong Kong

Compared with its recent development in mainland China and Taiwan, public relations emerged in Hong Kong in the 1890s when it was under the control of the British colonial government (SISU public relations research in China, 2010a). Foreign-owned public relations companies, such as Hill & Knowlton, were established there later through cash flows pouring into Hong Kong from American and European investors during the 1960s.

During the 1970s and 1980s, a thriving free market promoted the flourishing of public relations in Hong Kong. Hostel, banking, catering, and shipping industries were among the first to establish public relations departments.

A later, more critical time for Hong Kong public relations was in 1997, which saw its integration with China as well as a turbulent period of economic and health crises. These crises—combined with social, economic, political, and cultural changes and an increased emphasis on business connections with the mainland—created opportunities for professional practice that broadened the function in China to include reputation and crisis management, according to Martin (2009).

In Hong Kong, results of the latest Council of Public Relations Firms (CPRF) of Hong Kong benchmark study estimated that the public relations industry has achieved annual profits of 1.33 billion HKD (Hong Kong Dollar) (US\$17 million), with 2,000 staff serving around 2,865 corporate clients (Eaton, 2011).

According to the 2003 and 2005 annual report of statistics of the Hong Kong Public Relations Professionals' Association and the Hong Kong Census and Statistics Department, Hong Kong's practitioners from 270 firms number over 5,300: 80% are female, 57% graduated from college, 40% hold master's degree certificates or certificates of completion of public relations postgraduate coursework, 62% of employees work in internal public relations and the rest work as public relations consultants (Cui, 2008). The 2011 salary index shows that workers' monthly salaries range from 25,000 HKD (US\$3,220) to 125,000 HKD (US\$16,000) (ClassifiedPost, 2011). Nearly 71% of practitioners work more than 60 hours per week. The turnover rate is 25%, and they report feeling a great deal of pressure on the job (SISU public relations research in China, 2001a).

Results from the latest survey of CPRF of Hong Kong (Eaton, 2011) show consumer marketing (35%), corporate communications (25%), and financial communications (15%) produce the highest percentages of consultation fees. Despite this, CSR Asia (2008) reported the growing success of corporate social responsibility (CSR). Martin (2009) found this was mainly because of the rise in advocacy and citizen activism from 1997 to 2009. Also, companies in Hong Kong demonstrated superior CSR disclosure when compared to other Asia-Pacific listed companies: 69% of Hong Kong-listed companies disclosed their CSR company policies and codes.

Martin (2009) noted that the major professional public relations organizations in Hong Kong are (1) the International Association of Business Communication (IABC/HK), established in 1983, with more than 500 active participants; (2) Public Relations Professionals' Association Ltd. (PRPA), founded in 1995 as an independent organization composed of public relations practitioners from the commercial and public sectors; and (3) the Council of Public Relations Firms in Hong Kong (CPRF/HK) is the newest professional organization with member firms rather than individual practitioners.

The Hong Kong Shue Yan College first set up undergraduate courses around 1976. The Chinese University of Hong Kong in 1987 and Hong Kong Baptist University later in the 1990s opened full-time and part-time master's programs, respectively. Public relations education in Hong Kong generally follows the market development trend and tends to focus on financial public relations, CSR, and investment relationships. Still, Cui (2008) observed that there is no special research institution devoted solely to the study of public relations.

Taiwan

Wu, Lin, and Guo (2001) noted that public relations practice in Taiwan began during the early 1950s under government control. It did not begin to flourish there until 1987 when martial law and restrictions on newspaper licensing were lifted. Beginning in the 1990s, professional fields, such as high-tech public relations and election public relations, emerged.

The *Brain Magazine* conducted a survey of 73 public relations firms in Taiwan and found that the

average turnover of the market in Taiwan was approximately 3.4 million TWD (Taiwan Dollar) (US\$ 0.1 million) in 2004. The largest firm has 130 employees, and the smallest firm has only two. Firm capital ranges from 0.1 million TWD (US\$33,000) to 24 million TWD (US\$0.8 million); the average capital is 0.7 million TWD (US\$200,000).

According to statistics from the Council of Labor Affairs (2011), of the public relations practitioners in Taiwan in 2010, women constitute the majority, and the ages of Taiwanese public relations practitioners range from 20 to 45; 90.5% work in service industries (such as hotels and catering). Average monthly salary is around 48,600 TWD (US\$1,622).

The public relations business types in Taiwan include consumer-oriented industries, high-tech industries, and the health care industry. Tsai (2007) reported that Taiwan's industry is distinguished for having professional political public relations companies that work closely with political parties. Wu, Lin, and Guo (2001) found that these consulting companies play a critical role in urban markets, Taiwanese elections, and the broader public relations field (Wu, Taylor, & Chen, 2000).

Professional associations in Taiwan include the Chinese Public Relations Association, the Foundation for Public Relations, and the Taiwan Public Relations Management Association (TPRMA). TPRMA is responsible for professionally certifying public relations managers and administrators (SISU public relations research in China, 2011b).

Since the World College of Journalism (now Shih Hsin University) opened the first public relations courses in 1963, 30 universities have set up public relations courses. These universities include National Chengchi University, National Chiao Tung University, and Taiwan Normal University, according to Yan (2009). Huang (2004) concluded that the courses offered may be categorized using four subfoci: theories, management, practice, and special topics.

Public Relations in Great China

Generally, public relations practices in mainland China, Hong Kong, and Taiwan have shared a similar fate. From their start and through rapid development to their current professional development stage, the same four factors have played important

roles in influencing public relations practices: government, social codes of conduct, the free market, and professional practitioners, according to Wu, Lin, and Guo (2001). These, however, are only the broad similarities; there are many more precise parallels.

First, research in the mainland (17PR, 2011), Hong Kong (Cui, 2008), and Taiwan (Council of Labor Affairs, 2011; Yang, 2003) suggests that more than 50% of employees in all three regions are females. Furthermore, young employees outnumber older ones. Staff turnover rate remains high across the three regions (Cui, 2008; 17PR, 2011; Wu, Lin, & Guo, 2001).

Second, practitioners reported that interaction with the media is the single greatest focus of the practice in mainland China, Hong Kong, and Taiwan. In the mainland, CIPRA's 2011 survey shows that media activities are the central focus of the practice. Martin's 2009 analysis of 20 self-reported areas of the practice found that 100% of public relations consultancies in Hong Kong have a media relations division. Likewise, in 2005 the industry in Taiwan emphasized its media activities, and the proportion of media relations services greatly increased since 1992 (Brain Magazine Newsroom, 2005). Because China has recently been affected by the impact of scandals, including tainted pet food, toys, infant formula, and milk, crisis management emerged as another major area of concern for practitioners (Chinapr, 2012).

Third, public relations companies in China, Hong Kong, and Taiwan emphasize relationship building with stakeholders. In that regard, Huang concluded that cultural rules of Confucianism, Buddhism, and Taoism justify relationship building. However, more specifically practitioners employ *guanxi* and give face and favor, maintaining harmony, and constructing an asymmetrical, hierarchical structure of human relationships (Huang, 2001).

Finally, researchers pointed out the need to pay attention to other public relations professional activities. For example, strategic management and crisis management increased substantially as subfields in China, Hong Kong, and Taiwan as practitioners increasingly recognized the importance of these disciplines.

CIRCUIT OF CULTURE

As public relations practice evolves internationally and grapples with the tides of globalization, the need for a more nuanced and culturally sensitive theoretical base has emerged. Increasingly, post-modernist theory and cultural studies have become rich avenues for public relations theory that seeks to incorporate critical approaches to understanding public relations scholarship and practice. From this orientation, Patricia A. Curtin and T. Kenn Gaither (2007) adopted the *circuit of culture* from cultural studies to public relations.

The model is composed of five components, or “moments,” specifically production, regulation, representation, consumption, and identity. As a nonlinear model, the circuit has no starting point,

and each moment works in concert with the others to yield a shared cultural space in which meaning is created, shaped, and recreated. While each moment is a singular space, the moments work synergistically to create meaning. In the parlance of the circuit of culture, the points at which moments overlap are called articulations, where meanings are both contested and negotiated.

The circuit of culture is a useful tool for analyzing and guiding public relations practice globally. Each moment provides a pathway into this dynamic model, with no moment privileged over the others. The moments are *production*, which circuit cocreator Stuart Hall outlines as the processes by which creators of cultural products imbue them with meaning; *regulation*, which comprises the control on cultural activity; *representation*, the form an object takes and meanings encoded in that form; *consumption*, when audiences decode messages; and *identity*, meanings that accrue to all social networks, from nations to organizations to publics.

The heart of the circuit is consideration of how meaning is created through relationships with special emphasis on power at a micropolitical level and the primacy of culture in public relations. The model holds that public relations is a contested practice that is culturally bound with cultural particulars that are not grounded in Western notions of public relations practice.

In its first iteration, the circuit was used as an organizing framework for understanding cultural implications of the Sony Walkman. The circuit helped explain the uses and identities of the Walkman as a cultural artifact. Since its adoption to public relations practice, the circuit has been used to explore Coca-Cola's failed attempt to launch New Coke in 1985 and to deconstruct the public pressures that ousted a Starbucks café from the Forbidden City in China. It was tested to identify cultural value orientations that influence Arab culture for public relations professionals and scholars. These studies identified the fluidity of meanings within cultural contexts, suggesting challenges and opportunities particularly for practitioners who communicate across cultures, boundaries, and spaces. The circuit of culture advances the notion that public relations is a global practice predicated on effectively navigating differences across publics, organizations, cultures, and nations.

CIRCULATION

Circulation refers to the number of copies of a print medium that are distributed. For the public relations practitioner, circulation figures are important to consider when evaluating an advertising vehicle. When considering circulation figures, it is also important to distinguish between actual subscribers and how many copies are sold directly from the newsstand. Subscribers are most likely to be devoted to the publication—as is shown by the number of people who are renewing subscribers. When meeting with representatives from publications, it is important to gather not only circulation figures, but also the demographic information of the audience the publication reaches.

In the age of technological advances and social media, the public relations professional must consider statistics concerning online subscribers, as well as website hits and click-through rates on the publication's website. According to a 2010 report by the Pew Research Center, every news platform saw audiences either stall or decline—except for the Internet. Also, for the first time more people said they turn to the Web for news rather than to newspapers. The report projected that online ad revenue in 2010 would surpass print newspaper ad revenue for the first time.

The Pew Research Center's report titled *The State of the News Media 2012* indicated that the problems of newspapers became more acute in 2011. According to the report, even as online

audiences grew, print circulation continued to decline, and in 2011, losses in print advertising dollars outpaced gains in digital revenue by a factor of roughly 10 to 1, a ratio even worse than in 2010. When circulation and advertising revenue are combined, the newspaper industry has shrunk 43% since 2000, according to the report.

Public relations practitioners must research publications extensively to understand readership—both in print and online—before making decisions to run advertisements and or pitch reporters for possible placement of a story.

CITIZEN JOURNALISM/REPORTING

Citizen journalism/reporting is when members of the public actively engage in a process of collective discovery, problem solving, and information sharing on events, issues, and trends through various online forums and digital mobile technologies. Citizen journalists use the same tools as traditional journalists but avoid gatekeepers, such as editors and publishers. This allows independent, unfiltered, and decentralized information in the form of stories, pictures, and videos to quickly and directly reach the public. Although there is debate on whether citizen journalists/reporters are equal to traditional journalists/reporters, they are increasingly becoming noticed by organizations, government entities, and traditional media as a force that can inform the public and influence public opinion. By including, engaging, and partnering with citizen journalists, public relations professionals

can utilize them as critical sources of information as well as extend the reach and influence of their message.

Citizen journalism's prevalence has increased due to access and use of online and mobile communication technologies, such as weblogs, social media, Internet, cell phones, and digital cameras that allow them to potentially have global reach and influence. Citizen journalists see themselves as filling a vital gap in traditional journalism by allowing the public to serve as active consumers and producers of information through dynamic, democratic, and grassroots conversations. Citizen journalists can provide local, real-time, first-person perspectives of news and events that traditional journalists sometimes cannot cover due to shrinking staffs and budgets. They also can serve the same watchdog function of traditional journalism by monitoring, investigating, and commenting on what corporations, government institutions, and even the media are doing, or not doing, and saying.

Some question whether citizen journalists are equal in credibility, accuracy, and professionalism to traditional journalists. Critics cite lack of education or training in journalism techniques, the reporting of rumors, and the idea that any citizen who posts something online is a reporter. Those who argue for citizen journalism reason that they gain credibility through consistent reporting, accuracy, and transparency of sources and methods, have the benefit of community engagement and self-policing to quickly confirm or correct information, and agree that not all online citizen posts are journalism, but some can engage in the act of journalism. Organizations are recognizing the potential influence of citizen journalists by giving them the same access to organizational events and media briefings as traditional journalists. Organizations and media outlets are reaching out to them to provide critical and uncensored information when members or reporters don't have immediate access to an area or in-depth knowledge of an issue. Examples of this include blogging about tornado, flooding, or wildfire damage to a community; real-time updates on information and resources available; and the civil uprisings of the 2011–2012 Arab Spring.

CITIZENS ADVISORY COMMITTEES/ PANELS

Citizens advisory committees/panels (CAC/P) are composed of individuals, with membership drawn from a cross section of the community, who serve as a link between the public and various organizations that operate in the region by providing counsel and recommendations on matters of public affairs and public policy.

Citizens advisory committees/panels perform key functions for community residents, private interest groups, government, nongovernmental organizations, and private industry. They improve the quality of services by encouraging closer ties between the public and organizations that have an effect on their community, and they make for improved decision-making capabilities that involve perspectives from interested parties who participate in the process. Citizens advisory committees/panels incorporate strategic community relations values, such as the cooperation of key stakeholders, information and perception exchange, and the development of trust, sense of control, credibility, and consensus making.

Through the implementation of public policy at the community level, CAC/Ps provide a level of accountability for government, nongovernmental, and private organizations, opening up decision-making and policy formation processes to concerned citizens while providing resources for citizens to participate in the public policy process.

The use of advisory committees moves the role of external input and influence to an internal

advisory role working within the system. This public/private partnership facilitated by the role of the advisory committee is the “buckle that fastens the administrative process to the dominant institutions, elites, and value in society” (Cottin, 1973, p. 1140). The proliferation of and increased use and dependence on advisory committees is a product of a response to the needs of the citizenry, the needs of government officials, and the demands of special interest groups to work together in reaching compromise and solutions to numerous public policy concerns.

Originally categorized as lay advisory committees, CAC/Ps gained a foothold in U.S. society because, as a representative democracy, they provide a means by which citizens represent their community in addressing particular public affair issues ranging from education to land preservation.

The Western development and use of citizens committees can be traced back to England, where the use of such advisory groups for education and government was seen on a wide scale. In the United States, formal community advisory groups have been in operation since the first presidency. There was a significant increase in the number and types of community advisory groups during World War I, when many governmental commissions had citizens serving in an advisory capacity. Their role expanded during the depression of the 1930s, providing counsel on such topics as national illiteracy and emergency aid. During and following World War II, CAC/Ps expanded into areas of labor-management relations and postwar training programs for agricultural and industrial production.

The development and expansion of CAC/Ps have been driven not just by citizens' desires to participate in the public policy process, but also by national legislation aimed at increasing community input on vital issues. This approach is often called legislative citizen participation.

At the federal level, the 1972 Federal Advisory Committee Act (Public Law 92-463) defines an advisory committee as any committee, board, commission, council, panel, task force, or similar group established in the interest of obtaining advice or recommendations for the president or one or more agencies of offices of the federal government. The act also required that all records of advisory committee meetings be made public, with the exception of those pertaining to the National Academy of

Sciences, the National Academy of Public Administration, the CIA, and the Federal Reserve Board. Federal advisory committees constitute one of the most significant vehicles for special interest group representation and influence on the policy-making process of the national government. This form of government by committee has been termed the fifth arm of the federal government.

In the past 20 years, there has been a tremendous growth in legislated citizen participation in many areas. At present, most federal agencies have mandated citizen participation for many of their programs. The Mental Health Systems Act of 1980 (Public Law 96-398), for example, relies heavily on the voluntary efforts of citizens who advise and govern local community mental health center programs.

Typically there are two types of CAC/Ps: Short-term committees are organized to address specific issues and concerns for a finite time period, and long-term committees address specific as well as sweeping concerns and problems, providing continuous feedback from the community.

There are some typical rules and responsibilities of CAC/Ps across a broad spectrum of organizations. Advisory committees are appointed when there is a definite function to be performed; they are appointed primarily to advise and are not typically requested to perform specific services. Their composition should represent the entire community related to the function to be performed, with membership reflecting various segments of community life ranging from lay representatives to acknowledged experts. Staff members typically are not appointed, but if they are they constitute a minority of any such committee and the chairperson is chosen from among the lay members. Typically, the public is made aware of major recommendations, and the overseeing board or organization controls public announcements.

CAC/Ps are active in areas of education, health, manufacturing, transportation, and virtually every other facet of public policy decision-making that affects communities. For example, within the chemical industry, a CAC/P consists of a group of individuals who live near or around a chemical facility and who represent their community and have made a commitment to meet with the management of the local plant on a regular basis to discuss issues of mutual interest. Members include

environmental groups, civic leaders, business leaders, homemakers, hourly workers, and individuals who represent key elements of a community, such as clergy, health care providers, emergency responders, and educators.

CITIZENS UNITED V. FEDERAL ELECTION COMMISSION (2010)

In 2010, the U.S. Supreme Court ruled in *Citizens United v. Federal Election Commission* that Congress cannot ban political expenditures based on the speaker's corporate identity. The highly controversial holding overruled two precedent cases, shook the foundation of modern campaign finance law, stimulated a heated debate over the rights of corporations versus individuals in the political process, and resulted in calls for a constitutional amendment limiting corporate political spending.

The case began during the 2008 presidential primary elections, when Citizens United—a conservative, nonprofit advocacy corporation—used individual and corporate donations to finance a documentary film that opposed the candidacy of Senator Hillary Clinton for the Democratic Party nomination. Under the Bipartisan Campaign

Reform Act (BCRA), corporations and unions were forbidden from using general treasury funds to finance “electioneering communications,” which could only be paid for through a corporate or union political action committee (PAC). The BCRA defined an electioneering communication as any broadcast, cable, or satellite communication for or against any identifiable federal candidate made 30 days before a primary election or 60 days before a federal election. The Court had upheld that provision of the BCRA in 2003 in *McConnell v. Federal Election Commission*, reasoning that the law advanced “the important governmental interest of preventing corruption and the appearance of corruption” in federal elections. As written, the BCRA would subject Citizens United to criminal and civil penalties for broadcasting and/or promoting its film on regular or cable television.

The Supreme Court had focused on avoiding corruption in political campaigns as a justification for campaign finance regulation since its landmark 1976 decision in *Buckley v. Valeo*. In that case, the Court ruled that political spending constitutes a form of political speech protected by the First Amendment. To ensure the integrity of the electoral process, however, the Court upheld limitations on political contributions given directly to federal candidates as a means of avoiding real or apparent “quid pro quo” corruption, which it defined as the exchange of money for political favors. On the other hand, the *Buckley* Court found that limits placed on independent expenditures made by natural persons for or against a candidate did not present an equivalent risk of corruption, and therefore those limits violated the speaker’s First Amendment right to engage in political speech.

Two years after *Buckley*, the Court extended First Amendment protection to corporate speech in *First National Bank of Boston v. Bellotti*. That case established that the state could not prevent corporations from spending their own funds to purchase advertising supporting or opposing ballot initiatives. The *Bellotti* Court emphasized two factors in its decision: (1) the public’s First Amendment right to be exposed to diverse political views, including corporate perspectives, and (2) the lack of quid pro quo corruption associated with referendums as opposed to candidate elections.

Candidate elections, however, were a different matter. In a 1990 decision, *Austin v. Michigan*

Chamber of Commerce, the Court upheld a state law that prohibited unlimited corporate expenditures—not merely contributions—in election campaigns. To justify the restriction, the Court enlarged its *Buckley* definition of corruption from the exchange of political favors to include the “distorting effects of immense aggregations of wealth” that it believed unlimited corporate spending would inflict on the electoral system. According to the *Austin* majority, corporate expenditures could be limited to prevent corporations from achieving “an unfair advantage in the political marketplace” by using “resources amassed in the economic marketplace.”

Citizens United expressly overruled both *Austin*’s holding and its antidistortion rationale. The Court referred back to its reasoning in *Buckley* to conclude that if restrictions on independent expenditures violated the First Amendment rights of natural persons, restrictions on independent expenditures by corporations or unions would also be unconstitutional. Writing for a 5–4 majority, Justice Anthony Kennedy stated that “[i]f the First Amendment has any force, it prohibits Congress from fining or jailing citizens, or associations of citizens, for simply engaging in political speech.” Any attempt by the state to limit corporate political expenditures to avoid marketplace distortion was characterized by the *Citizens United* Court as an unconstitutional attempt to equalize speech based on the speaker’s identity. The Court also overruled *McConnell* to the extent that it upheld the BCRA limitations on corporate or union expenditures for broadcast advertising for or against an identifiable candidate.

In a sharp and lengthy dissent, Justice John Paul Stevens characterized corporate spending limits as permissible time, place, and manner restrictions that served to keep corporate speakers from clogging up the channels of political communication. In his view, corporations exert too much influence over officeholders and the electoral system and, therefore, corporate spending limits are needed to protect the integrity of the political process. “While American democracy is imperfect,” Justice Stevens wrote, “few outside the majority of this Court would have thought its flaws included a dearth of corporate money in politics.”

Based on *Citizens United*, the United States Court of Appeals for the D.C. Circuit ruled in 2010 that PACs can accept unlimited amounts

from individuals, unions, or corporations for the purpose of making independent expenditures, as long as those PACs do not contribute to candidates, political parties, or other PACs. Because of their resulting ability to raise and spend large sums of money, these PACs are commonly referred to as SuperPACs.

Citizens United is one of the Court's most controversial recent holdings. Following the decision, many state legislators, local governments, advocacy groups, and unions sponsored measures demanding that Congress pass a constitutional amendment to revoke the First Amendment rights of corporate speakers. Given the unlikely success of a constitutional amendment, some legal scholars have suggested that states enact legislation requiring shareholders to approve all corporate political expenditures.

CIVIL SOCIETY

Public relations is traditionally viewed as a business function. In a business-oriented perspective of public relations, practitioners work to help their organization achieve its goals, typically an economic benefit. It supports a variety of organizational activities, such as marketing, brand image, reputation, and public policy issues relevant to

economic benefit. Thus, public relations contributes to an organization's bottom line.

In 2004, Carl H. Botan and Maureen Taylor argued that another approach to public relations was taking place that was just as valuable to organizational survival as the functional practices of public relations. The co-creational approach to public relations reflects a turn to more public-centered approaches that provide a framework for understanding a broader and more profound role for public relations in society. The co-creational approach encompasses theories and frameworks that argue that its role is to facilitate the creation of shared meaning through engagement with organizational stakeholders in a society. Organizations build relationships and those relationships have value to the organization, the public, and the society as a whole.

Civil society theory embodies many of the assumptions of the co-creational turn but takes the level of analysis to a higher, societal level. Civil society is one theoretical framework, along with fully functioning society theory, for understanding a broader societal role for public relations. Civil society may eventually emerge as an umbrella theory for the co-creational approaches to public relations.

Civil society describes a normative/ideal space where people interact and negotiate outcomes. It is an evolving process of engagement, cooperation, and trust. The trust that emerges from cooperative interactions is another type of capital: social capital. One way to understand the value of social capital is to conceive of it as the invisible wealth of a community that strengthens civil society. Ethical public relations communication through such activities as media relations, information subsidies, activism, political communication, and social media all contribute to the ability of people to share ideas and participate in decision making. When people interact, share information, or work in collective action, then civil society is strengthened.

Civil society is not a panacea nor does every type of collective action build social capital or public good for a community. Yet, the relationships that are created by public relations become the foundation of civil society. Through public relations, both functional and co-creational approaches, new relationships emerge. Communication and interactions are generative—one interaction begets

another, which begets another, and so on. Public relations efforts not only build the relationships, they also sustain and improve them.

Key Partners

There are many organizational partners in civil society. Maureen Taylor and Marya L. Doerfel (2005) identified seven key partners in civil society initiatives:

1. Individuals become *publics* when they co-create meaning with others and start seeing that they share interests with others in an issue.

2. *Social cause groups*, such as activists, nonprofit organizations, and nongovernmental organizations (NGOs), are partners in civil society. Examples of social cause groups include environmental groups, political organizations, social welfare groups, health promotion groups, and human rights defenders. Their collective activities contribute to civil society because they produce and benefit a common or public good.

3. *Societal institutions* comprise another layer of civil society. Societal institutions are long-standing organizations that have the perceived legitimacy to participate in decision making, such as associations of doctors, lawyers, and educators. When the American Medical Association (AMA) or AARP weighs in on an issue, people and politicians listen. Institutions, such as universities, unions, and religious groups, have a role to play in civil society.

4. The *media* are key partners in ensuring that there is a civil sphere. Traditional and new media organizations have the potential to perform an important function in strengthening the civil sphere. They are expected to disseminate accurate information that citizens use to make decisions. The independent media serve as watchdogs to ensure that government officials and businesses are held accountable for their actions. The traditional concept of media was that of television, radio, or print outlets that covered news for a community. The dominant mass communication media had wide dissemination and allowed for shared interpretations of local, regional, national, and international events. Newer forms of media, with more niche audiences, are now competing outlets

for news users and have also emerged as watchdogs and commentators on current events. Today, with the advent of citizen journalism, anyone can post their interpretations of news and events online for others to read, see, or hear.

5. The *business community* plays a role in the development of civil society. Business organizations have opinions on issues, such as regulation, licensing, access to natural resources, price controls, immigration laws, and legal reform. It is to their advantage that their voices also be included in the civil sphere. And, an ancillary benefit gained by the civil society is that with business participation, communicative links with other civil society entities (government and media) are formed.

6. Another partner in civil society is *governance*—the local, regional, and national leaders that participate in policy formation. Government leaders, as well as members of the bureaucracy who support government, need to be accountable to the aforementioned partners. Government leaders need to carefully monitor public opinion and be willing to adapt to the publics' changing needs. In a normative model of civil society, government leaders at all levels understand issues and resolve them in a manner that benefits those they lead. Government leaders take their cues from the multiple discourses of civil society partners.

7. Finally, *international organizations* have an important role in fostering civil society. There are two types of international organizations: donor organizations and supranational groups. In developing and post-crisis countries, the United Nations (UN), the United States Agency for International Development (USAID), and the George Soros Open Society Institute (OSI) provide financial and human resources to help facilitate development. A second kind of international organizational type includes supranational groups, such as the World Bank, World Trade Organization, International Atomic Agency, climate change consortiums, and other global regulatory groups that can shape national and global discourse in the civil sphere. Although, it must be noted that they require the other partners in global civil society to enforce any international practices. For instance, if the World Health Organization (WHO) recommends that every child be vaccinated against polio, it

needs the support of many different civil society partners to accomplish this recommendation: the public, local NGOs, media, governance, and other donor NGOs. If one partner in society is unwilling to help, the other partners have a more difficult time accomplishing this objective.

The seven partners create the foundation of civil society. While each partner has its own goals, issues, and needs and represents different citizen interests, civil society is the place to have the inter-related objectives among these different groups come together. When the interests of two or more partners converge, there is a much greater opportunity for them to achieve their goals. For instance, when the business community, social cause groups, and governance agree that something needs to be done to safeguard the food supply, there is a greater chance for collective action. If only one group believes there is a need, that group should reach out to other civil society partners through both functional and co-creational public relations approaches, to build awareness and support. An effective civil society rests in the intersection of all of these partners' interests. In this intersection of interests, the role for rhetorical public relations activities becomes most clear.

Toward a Broader Role for Public Relations in Society

Public relations has a broader role in society than the functional practices of media relations or supporting marketing. Public relations can help individuals, groups, and governments participate in the marketplace of ideas and provide the information that forms relationships. It is in this relationship building function that the field will find the answer to the question, "what does public relations contribute to society?" The answer is clear: Public relations' role in society is to create (and recreate) the conditions that enact civil society. Public relations provides all of the communication functions necessary to build awareness, build relationships, and coordinate action in a society. It gives a voice to the individual, empowers the organization, provides content to the media, and promotes an orientation to others that enables collective action that creates a common good.

CLIENT

The client is the representative entering into a contractual relationship with a public relations firm for the purpose of securing the firm's expertise. The representative can be an individual, such as a political candidate or an entertainer, a department or subsidiary of a larger organization, a corporation, and so on. Firms are hired by that client for any number of reasons ranging from general promotions to strategic planning and issues management. Larger organizations may contract with several firms for needed specializations, such as hiring one firm for international relations work and another firm for crisis management. These relationships may be short term, such as for the duration of a crisis, a particular special event, or the publication of specialized collateral material, and in these cases the client sets up some project-based method of payment for the services. The business may also be long term based on providing longer-standing services through continued counseling or augmenting the organization's staff in particular areas, in which case a retainer method of payment for the services is the usual preference.

The client initiates the relationship, of course, by recognizing a need for some kind of assistance in the area of public relations. The better the client can explicate its objectives, the more likely the result is an efficient and highly successful search. The search can range from informal to formal. In some cases, one representative of the client handles the entire process, and in other cases the team may include several representatives of the organization. Ideally, the team includes the key contact person for the firm and the final decision maker, because these players are critical in establishing the relationship with the firm selected.

If the search is handled informally, it may be based solely on contacts. The client possibly had a productive past relationship with a firm and chose to renew that relationship. If the need for the firm is local, very specific, and specialized and the budget is limited, the search may be a matter of simply determining availability of a local firm.

In the more formal cases, the selection process may be managed either by the client or by a consulting firm that specializes in assisting groups with the details involved in a formal search of public relations firms. Time may be a determinant in whether the client organizes the search or hires out the search process. Using a consulting firm means that the firm identifies the public relations firms most likely to be of interest, manages the request for proposals, and organizes the formal agency proposal processes.

Regardless of whether the client or another firm manages the search, it begins with networking and general research to identify potential firms. The firms viewed as most interesting in terms of perceived capabilities and reputations are sent requests for proposals (RFPs). RFPs are questionnaires designed to narrow the field of potential firms and may include demographic data related to the firm (size, length of time in the field, specializations, and so on) as well as a few screening questions to determine expertise in the client's area or ability to handle the issues at hand. RFPs allow the organization to examine the firms from a distance to determine the firm's expertise, its style, and especially to identify any conflict of interest if one of the potential firms is representing a competitor. RFPs, furthermore, allow the public relations firms themselves to "self-select" their formal participation in the search; for example, some firms may opt out of the process due to other commitments,

or the size of the project is either too large or too small for their preference. The organization then generally chooses three to five firms to interview. The client may want to consider finalists for the continued search process based on variety—of size, services (full service to boutique), location, ownership (independent to multinational)—as well as various specializations. Including a variety of firms allows the client to better assess a range of issues affecting the final decision. Smaller firms with fewer clients may be able to provide more attention to the issue, whereas larger firms with offices throughout the United States and overseas may be better prepared to manage international product introductions or other broader based public relations programs.

The firms considered as finalists in the search process are contacted and asked to put together a presentation (also known as a pitch), which may consist of general information on the firm or a specialized presentation with suggestions for addressing the prospective client's objectives. The more specific the presentation requests, the more conscientious the client must be. Clients may need to consider payment for formal presentations complete with specific program proposals; many such presentations are copyrighted and selection of one firm to implement another firm's program could likely involve legal ramifications.

Following the various pitches, the client then must select one firm. The selection typically focuses on which firm is best qualified to handle the account, which firm best understands the organization as well as its business or service, and which firm the decision makers feel most comfortable in working with or the "chemistry" perceived during this selection process. In some cases, the client may have difficulty choosing between two firms and may request a follow-up interview, often conducted as a conference call or through email.

At this point, the firm generally sets up a contract based on estimations of costs for the objectives to be accomplished. The client and the firm agree on the contract as well as the billing procedures. Billing is frequently managed by a projected cost with monthly billable hours toward that projected cost. Projected costs may or may not include out-of-pocket expenses and commissions for any subcontracted work (e.g., with a printer). Clients can then monitor expenditures and determine

whether the firm is staying within reasonable budgeted programs or whether the progress of the program may warrant additional expenditures.

As is evident, much time is invested in initiating and establishing the firm–client relationship. Once secured, the client representatives can focus on their own jobs knowing that the firm is ably managing the public relations program. The firm formalizes the account team with a designated account executive who is the primary point of contact between the firm and the client. Note that the ideal pitch involves individuals who remain part of the account team. If only the firm’s CEOs manage the pitch, the client should proceed with caution because the relationship is set by those who work on the account daily, not by the CEOs. On the client side, the key contact points and decision-making process should be established and streamlined as much as possible to reduce delays in processing approvals.

Ideally, the firm–client relationship stretches far into the future without the need to undergo another search. Nevertheless, the economy, management changes, and other business developments may lead to a need for a different or an additional firm.

The ultimate goal of the successful firm–client relationship is to achieve what is considered the most efficient contract (per “agency theory” derived from finance and economics research). The burden of demonstrating efficiency is often placed on the agency or firm, yet the client sets the tenor of the relationships. The ideal client who ultimately finances this relationship to secure or augment available public relations expertise stays involved and interested in the public relations program. The ideal client does not micromanage but strikes a balance of trust in the firm and supervision of the firm. Clients should be cautioned that some monitoring may be necessary to ensure that the client interests remain paramount for the firm and to verify that all billing is appropriate and per contract. This balance can be achieved with clear expectations, regular communication, and timely payments for services rendered. The ideal firm similarly provides clear plans and programs, meets deadlines, stays within budget, and communicates regularly.

The successful relationship, then, depends on evaluation—of the public relations program as well as of the relationship itself. Clear and honest communications about the program, as well as any

impending changes to the client organization, are critical to managing expectations and program fulfillment. If the public relations firm does not initiate evaluations at various points in the relationship, then the client may request or implement them. The evaluations may range from informal discussions (although the evaluation should be a specified agenda item if not the sole topic of discussion) to formal checklists that would then be discussed with the agency account executive and CEO as well as key client liaisons.

CLIENT–AGENCY RELATIONSHIPS

The client–agency relationship is the state of interaction between an organization (or its representative) and the public relations firm it hires to represent it. Their relationship can be the most important factor in the success of the client’s public relations program and the firm’s ability to serve the client well.

Much of the pressure to maintain the relationship rests with the agency. The ability to build a strong client–agency relationship is one of the most important skills a practitioner can offer. Serving the client requires that the agency staff keep the client’s best interests in mind and share the client’s

understanding of and passion for its business goals, while at the same time working toward the agency's own goals.

Some client–agency relationships have been so strong that they make history. For example, the widely praised handling of the Tylenol product-tampering crisis in 1982 was the result of the bond between Tylenol maker Johnson & Johnson and its firm, Burson-Marsteller. This case is widely recognized as one of the most important in the history of the practice of public relations and exemplifies the ideal client–agency relationship qualities of mutual respect, trust, and understanding of the client's needs.

Client confidence in the agency, free-flowing communication, willingness to compromise on both sides, and collaboration between client and agency are also key. The client wants the feeling of being top priority regardless of what other accounts the agency is working on. The most successful account people remember that on and off the job, they represent not only themselves and the agency but the client as well, and they must exhibit professionalism at all times. In addition, thoughtfulness and consideration of both the agency staff and client contact's work and personal situations can help the relationship flourish.

The client also wants the agency to be problem solvers. Industry leader Harold Burson once said that the counselor's main objective is to identify and deal successfully with a problem. Burson also advised taking advantage of opportunities; developing a set of options and a range of their advantages/disadvantages; honing the ability to get up to speed quickly on a problem and to listen; and knowing the client's business.

The most valuable commodity the agency can offer is its counsel—the ability to advise the client on the proper course of action. The ability to counsel comes with experience, but it also means being able to sift through issues and information and make a recommendation. Even the most junior-level staff member can demonstrate this skill.

The practitioner must balance serving the client with an obligation to the public at large, urges the Public Relations Society of America (PRSA), the world's largest professional society for public relations practitioners. In its *Member Statement of Professional Values*, PRSA says the

practitioner must serve in the public interest while remaining loyal to the client. PRSA also advises that the agency must disclose on whose behalf it operates, and avoid deceptive practices. The increasing use of technology has seemingly presented new ways in which agencies and their employees are tempted to disregard these tenets, yet they do so at the risk of losing their client relationships and moreover damaging the reputation of the industry.

The client and agency may not always agree. Sometimes counseling means being able to persuade a client who is not open to what the agency has to say. When the agency and client disagree, the agency must decide whether to push to persuade—or challenge—the client. It takes a delicate touch to know when to take that stand, and a strong relationship provides the foundation for respectful give-and-take.

Sometimes the working relationship between the client and agency creates conflict that cannot be resolved, and the result is either a reassignment of those working on the account or a parting of ways. If the client fires the agency, more often than not, it is because the client is not satisfied with the agency's performance. Sometimes, the client expected too much; but in many cases, companies who fire their agencies say it is because of sloppy work. Better communication between the agency and client might prevent such an outcome.

Conversely, a firm might resign the account because of problems with the relationship, such as client mistreatment of account people. Again, in a strong relationship such behavior can be addressed and resolved, preventing the severing of ties.

Ideally, the client appreciates and draws on the agency's level of expertise, looks to the agency to provide direction, and considers the value of the agency's work well worth the cost. A successful agency is able to produce excellent results, maintain a nourishing workplace, and meet its own business goals while nurturing its client relationships to the betterment of both client and agency.

CLIP (NEWS CLIP) AND CLIPPING SERVICES

A clip, or news clip, is an actual copy of an article about an organization or company that has appeared in the media. Traditionally, news clips were limited to print articles, but today, “clippings” can consist of print, broadcast, and online media sources.

Clipping services, also known as media monitoring services, monitor the media for references of a client’s organization or company and supply the client with a compilation of the clips. These clips are essential to gauging the success of a media relations campaign because they allow the client to keep track of how many times the organization or company was mentioned and where these articles appeared. Information gained from media monitoring services allows communications professionals to gather important insight about how their organization is being portrayed in the media, what topics are deemed newsworthy, and which reporters are covering the topics.

There are many companies that keep track of media “hits” for an organization on a paid subscription basis. Some companies are limited to one medium, whereas others not only keep track of all media, but also analyze and interpret the numbers. Some of the best known clipping services include BurrellesLuce (www.burrellesluce.com), Bacon’s (www.bacons.com), Vocus (www.vocus.com), Lexis-Nexis (www.lexisnexis.com), CyberAlert (www.cyberalert.com), EWatch (www.ewatch.com), CyberScan (www.clippingservice.com), and a host of other companies that have developed over the past few years.

Originally, only print media were monitored. When Burrelle’s began its service in 1888, only New York City daily newspapers were included in the service. Today, however, Burrelle’s and other companies that provide monitoring services scan not only newspapers but also magazines, radio and TV broadcasts, wire services, and various news programs found on the Internet. Additionally, media from across the United States and international sources are often included in the service.

Monitoring services have taken their products a step further and now monitor the Internet for rumors about a company as well as search for

general news stories. By catching negative chatter about a company in Internet chat rooms and discussion forums, corporations can become aware of any rumor that is circulating online and swiftly respond, if necessary.

Subscribing to these services may be cost prohibitive for small companies and organizations. Annual costs for a media monitoring service can easily surpass \$30,000; therefore, it is necessary to determine whether the considerable cost justifies the means, or if it is practical to subscribe to a more limited service.

COALITION BUILDING

Coalition building is the process of developing working relationships among individuals, groups, organizations, or nations for the purposes of mobilizing collective action, sharing information, coordinating communication efforts, or using any combination of these functions. Coalitions are a type of an alliance; however, unlike alliances, such as the North Atlantic Treaty Organization (NATO), members frequently organize coalitions for short-term purposes. For example, several NATO nations

formed the Coalition to Disarm Iraq in 2002. In addition to government coalitions, Fortune 500 and nonprofit organizations commonly use coalitions to advance their interests. Given the frequent diversity and competing interests of coalition members, the construction and maintenance of successful coalitions requires skilled facilitation and communication by coalition organizers.

Coalition building is an important part of public relations because it can enable like-minded members to exert increased influence by working together. The synergy of coalitions can enhance credibility for a particular position by demonstrating widespread agreement. Using combined economic, social, and political resources, coalition lobbying can increase clout with key decision makers and boost media coverage. Communication networks among coalition members can facilitate rapid information sharing, which can serve as early warning systems for issues that arise that impact the coalition, its members, or both.

Internal Coalition Building

Internal coalition building occurs when employees create alliances with other employees in an organization. Public relations practitioners commonly engage in internal coalition building when they need additional support to influence organizational decision making. For example, public relations practitioners could engage in coalition building to convince their employer to choose an ethical course of action or respond to a crisis in a particular way. Internal coalition building can occur overtly or behind the scenes. A public relations practitioner could engage in overt coalition building by receiving permission to sit in on key decision makers' meetings. Public relations practitioners also commonly engage in coalition building behind the scenes. For example, a public relations practitioner could meet with other employees informally to seek their support for a position prior to a vote at a meeting.

External Coalition Building

External coalition building differs from internal coalition building by involving members of different organizations. To identify coalition members, consideration should be given to the organization's reputation and how it might help or discredit the

coalition, the organization's position on the issue, whether the organization is easy to work with, and how the organization might contribute in terms of thought leadership, financial backing, and outreach to grassroots advocates.

A coalition might consider inviting unlikely partners if an agreement can be reached regarding the coalition's objectives, strategies, and tactics. By crossing lines, such as ideology and geography, coalitions can enhance their credibility by positioning themselves as representing broad interests. For example, when car manufacturers wanted to oppose a proposed increase in fuel efficiency standards, which could lead to fewer large cars and vans, they created the Coalition for Vehicle Choice, whose members included disabled veterans' organizations and senior citizens' groups, both of which depend on large vehicles for transportation. A second example is the Common Ground Network for Life and Choice, which prochoice and prolife organizations formed in 1999 to increase awareness and support for adoption. In both instances, these coalitions achieved more visibility and progress together than either member could have done alone or with its more common allies.

How coalitions are structured is an important aspect of their formation and management. A common structure is equal partnerships in which each member commits to sharing power from the earliest planning stages to the final efforts. Even relatively minor details, such as who gets to speak first at a dinner event, whose name appears first on an invitation, and who is quoted in media materials, can threaten the vitality of relationships among coalition members. Consequently, organizers in an equal partnership should have coalition members affirm their commitment to equal control. In unequal partnership designs, one or more members assume a majority of the responsibility for the coalition's efforts. Dominant members often fund all coalition costs, develop all public relations materials, and take full behind-the-scenes responsibility for the planning, execution, and evaluation of coalition actions. Prior to preparing materials, dominant coalition members commonly recruit new members for the coalition. New members receive name recognition on coalition materials while the coalition enhances its legitimacy by demonstrating the support of additional members and, implicitly, their supporters. In addition, members

that play minor coalition roles typically receive free media materials from dominant members; in turn, dominant members benefit from the message being further publicized without added cost.

The mobilization of collective action is one of the most powerful uses of coalitions. Skilled facilitation is required to coordinate the coalition's efforts, and either a public relations professional or another type of executive can fulfill this role. The chosen facilitator should have a transformational leadership style, which involves building personal rapport and focusing on collective interests rather than a personal agenda. Transformational leaders are charismatic and can mobilize audiences.

Facilitators must coordinate the development of the coalition's ground rules, which can include desired member behavior, information regarding confidentiality, the identification of who can speak on behalf of the coalition and who can commit the coalition to meet with outsiders, as well as a procedure for ethical decision making. Facilitators working in coalitions with equal partnerships should consider developing the ground rules with the group. Regardless of the partnership design, coalition members should agree on the ground rules as a condition of membership. Coalitions commonly formalize their ground rules in a written document and ask each member to sign it to indicate agreement. Some coalitions follow a win-win or no-deal model by only adopting positions that every member supports. Public relations practitioners have found creative ways to agree in public policy contexts without compromising coalition members' positions. One way is to have coalition members support a general position, which is expressed in all coalition materials. Each member's specific materials can include the coalition's position, as well as its specific stance on it.

Despite having ground rules in place, conflict can arise when developing the coalition's mission statement, goals, measurable objectives, strategies, tactics, and plans for assessment. Facilitators need to embrace conflict rather than shy away from it. Skilled facilitators can draw out quiet coalition members, prevent vocal members from dominating meetings, keep the atmosphere constructive, build morale, and foster relationships among members, which is known as peer linking. The quality of personal relationships among participants is critical to members' ability to work together effectively. This

is especially important, considering the common turf battles that coalition members encounter as they compete for resources in their work outside of the coalition. In addition, facilitators should ensure that every member feels valued. Regular assessments by the facilitator and coalition members can result in identifying any adjustments to the coalition to improve effectiveness, which can include changing the organization's internal procedures. Facilitators should also ensure that there are established communication channels for keeping coalition members informed about the group's activities and achievements.

When presenting the coalition's position to a wider audience, coalitions should coordinate consistent messages among members. Coalition members can reject, agree on, and create new terms to encourage a particular position on a situation. For example, the term *so-called* typically precedes words that coalitions reject, and coalitions can encourage the media to use desired terms and place the qualifying word *so-called* in front of rejected terms. In addition to determining words to use and avoid, coalitions can develop message points for media inquiries and train experts to whom coalition members can refer these inquiries. Sometimes coalitions want to present a united front on contentious issues; however, at other times, members might prefer to coordinate communication privately.

CO-CREATION OF MEANING THEORY

Robert L. Heath pioneered the use of co-creation of meaning theory for public relations in his approach to management of corporate communication. He drew on the work of Eric M. Eisenberg who stressed the need to focus on the concepts of meaning and interpretations as a means for understanding organizational communication. Eisenberg (1984) emphasized how relationships between people both in organizations and outside of them depend on shared meanings. Co-creation allows all parties to contribute to the shared view of organizational and social lives needed for coordinated enactment, as we can learn from Eisenberg (1984).

As Heath (1994) emphasized, co-creation differs fundamentally from a referential view of how words come to have meaning:

A referential view of meaning assumes that people think of the same referent as they interpret the definition of a term or phrase. A co-orientational view of meaning acknowledges the presence of ambiguity, and assumes that one person can understand the other by knowing how that person interprets a word or phrase even if the two people hold different interpretations. (p. 25)

Thus, for instance, both employer and worker share meaning for the activity “work,” but corporations can apply the meaning “cost” to work, whereas employees see it as their identity. A referential approach assumes that both parties look to the activity or thing to define the word. A

constructionist, co-creational view presumes as the basis for shared meaning that meaning cultures, which can differ markedly, depend on meaning that develops through interactions.

Co-orientation assumes that through interaction people develop the interpretations and expectations they need to coordinate their activities. In managing corporate communication, the key issue is to manage the interactions in such a way that compatible zones of meaning are created with and among stakeholders. This presumes dialogue rather than monologue.

In organizational theory, Stanley A. Deetz, Sarah J. Tracy, and Jennifer Lyn Simpson (2000) focused on the “enactment of meanings” (p. xiii) by which learning processes are developed individually and collectively through the use of language. Through interaction, people develop various interpretations of an event. Thus, people’s understanding of an event are framed or reframed through language, stories, and rituals; conversations are useful for creating alternative futures and opening the business to a wider collective learning process.

Co-creation of meaning theory is found in European approaches to public relations. For example, Roland Burkart viewed public relations as the facilitation of dialogic interaction between organization and its publics. Ansgar Zerfass (1996) called dialogues “arguments in which new meanings develop” (pp. 31–32). Just as language in use is an ongoing process, so is meaning creation. The intellectual basis of this view of public relations is contemporary rhetorical theory, which explains discourse tactics as what players use to maneuver in communicative interactions. A key aspect of this view is the creation of many meanings based more on a “battle” of interests than on harmony of interest.

Heath’s (2000) rhetorical enactment approach reasoned “that all of what an organization does and says is a statement. It is a statement that is interpreted idiosyncratically by each market, audience, and public” (p. 4). In a co-creation of meaning theory of public relations, the aim is to find deliberate and pluralistic solutions for problems. By doing this, an organization produces and reproduces its environment and is, therefore, a key actor itself. The key perspective is that by facilitating interactions, new meanings are continually created. That is why this is an open-ended model, a learning process that never stops.

The concept of meaning is a much-debated concept in human communication theory. Meaning can be explained as the “whole way in which we understand, explain, feel about, and react towards a given phenomenon” (Rosengren, 2000, p. 59). A crucial question is whose meaning is created by whom, and what does it mean for interpreting the world?

Recent approaches to the concept of communication are focused on communication as a fundamental two-way process for creating and exchanging meaning, interactive and participatory at all levels. This is a paradigmatic change from a sender/receiver orientation to an actor orientation.

Regarding the character of meaning, many theorists differentiate between connotative and denotative meaning by stressing that the connotative meaning steers behavior much more than the denotative meaning does. A denotative meaning of a phenomenon is the dictionary meaning. It is the literal or overt meaning that is shared by most people of a same language or culture. The connotative meaning refers to subjective associations. In a co-creation of meaning theory, the connotative perspective of meaning is seen as most powerful in steering behavior.

Co-creation of meaning theory is rooted in symbolic interactionism: The idea that reality is not “something out there,” but that human beings construct reality themselves. This idea was popularized by one of the most frequently cited works in social sciences, *The Social Construction of Reality* (Berger & Luckmann, 1966). Accordingly, reality is a quality pertaining to phenomena we recognize as having a being, independent of our own volition: We cannot wish them away. Knowledge is the certainty that phenomena are real, but possess specific co-created characteristics.

Thus, the sociology of knowledge is concerned with the social construction of reality. Likewise, social structure can be seen as an essential element of the reality of everyday life.

At one pole of the continuum are those others with whom I frequently interact in face-to-face situations—my inner circle, as it were. At the other pole are highly anonymous abstractions, which by their very nature can never be available in face-to-face interaction. Social structure is the sum total of these typifications and of the recurrent patterns of interaction established by means of them. (Berger & Luckmann, 1966, p. 48)

Languages, as a shared system of vocal signs, build up semantic fields or zones of meaning that are linguistically circumscribed. While it is possible to say that humans have a nature, it is more significant to say they construct their own nature, or simply, that humans produce themselves through language. This self-production is always, and of necessity, a social enterprise. Humans together produce a human environment, with the totality of its sociocultural and psychological formations. It may be that a given social order precedes any individual organism’s development, but social order is still a human product, or, more precisely, an ongoing human production.

By playing roles, individuals participate in a social world. By internalizing these roles, that world becomes subjectively real to them. Roles represent institutional order. Some of these, however symbolically, represent that order in its totality more than others. Such roles are of great strategic importance in a society, since they represent not only that of the other institution, but the integration of all institutions in a meaningful world. These roles have a special relationship to the legitimating apparatus of society.

Historically these roles have most commonly been located in political and religious institutions. This is no longer the case; today, nongovernmental organizations and corporations have more power than politics and religion. According to Peter Berger and Thomas Luckmann, legitimation is a process best described as a “second-order” objectification of meaning. Its function is to make objectively available and subjectively plausible the “first-order” objectifications that have been institutionalized. It embodies the institutional order by ascribing cognitive validity to its objectified meanings and justifies them, but in the modern world, there is always a rivalry between definitions of reality; as such, an examination of reality is not inherently functional to resolve meaning conflicts. Rather, social structure and order predict the outcome of shared meaning without which people (and organizations) cannot coordinate their activities and live their futures.

In these ways, symbolic interactionism has inspired scholars to adopt a constructionist view of reality. In 1993, German communication scholars Manfred Rühl and Günter Bentele introduced a constructionist view that human beings reflect the other to themselves, and social reality is a

dynamic process. Thus, constructing social reality is a shared process of meaning construction. In this view, reflective interpretation and conceptualization of meanings are at the forefront in a constant process of de- and re-construction; so, they are a “reflection.” Similarly, Klaus Krippendorf mentioned the “recursiveness” of communication: An ongoing social process of de- and reconstruction of interpretations. That is why Werner Faulstich and other constructionist public relations scholars state that public relations is not just interaction between human beings (e.g., organization and its publics), but societal action where interpretations are constantly de- and re-constructed. Consequently, public relations can be seen as understanding and steering these de- and re-constructions, a view basic to most European public relations theory.

CODES OF ETHICS

A code of ethics is a formal statement of conduct or a set of rules, standards, or guidelines for appropriate member behavior that has been adopted by an organization or professional association. Ethical codes, such as General Motor’s *Winning with Integrity* and Microsoft’s *Standards of Business Conduct*, have been popular in organizations since at least the 1970s. Codes of ethics were originally created by many organizations and professional associations in the 1950s and 1960s partly in response to specific ethical wrongdoings. Some were even mandated by the courts as part of larger legal settlements. Codes are associated with professions, such as law, marketing, accounting, and counseling. Some professional codes, including the Hippocratic Oath in medicine, have ancient origins.

Ethical codes take a variety of forms. Some are specific legalistic documents with a mechanism for enforcement and signature pages requiring that the employee explicitly agree to abide by the code. Others are very general statements of values or principles that the organization or association aspires to with no specific enforcement provisions. Some codes include vignettes or cases to illustrate ethical conduct and assist in training. Statements of core values or mission statements sometimes serve as the organization's formal declaration of ethics. Codes are typically distributed to members of the organization, may be posted on websites, and in some cases, are prominently displayed throughout the organization.

Codes serve a variety of functions, including protecting the organization from legal liability, constraining and focusing employee behavior, elevating the levels of conduct and limiting unethical behavior, assessing and judging member behavior as a defense against criticism, and enhancing the image and reputation of an organization or professional group. In the latter sense, ethical codes themselves may serve as an issue management, image restoration, or public relations function. Codes also help communicate value positions and ethical standards to stakeholders and facilitate discussions regarding appropriate organizational or professional ethics and values. In this way, codes are often the most important and explicit means whereby organizational and professional values are communicated. It is relatively common, for example, for all new employees to receive copies of ethical codes. Codes and ethics programs are related to improved ethical climate and are particularly important during times of uncertainty, transition, and even crisis.

Ethical codes and guidelines function in part by explicitly clarifying issues of responsibility and accountability. Many corporate codes are designed to clarify issues of conflict of interest, loyalty, and obligations. Increasingly, corporate codes discuss issues of corporate social responsibility and identify larger obligations to society, the environment, communities, and other stakeholders. Some organizations have established ethics officers or committees responsible for both promoting the code and enforcing its standards. Richard L. Johannesen (2002) suggested that codes serve an argumentative function, "to stimulate public and professional

scrutiny of major ethical issues" (p. 201). Codes, for example, discuss the value of a good or ethical reputation and encourage members to interact in a professional and responsible manner with external stakeholders. Ethical codes and value statements, however, should not be seen as panaceas for ethical communication in organizations or among professionals.

Codes of ethical conduct are recognized as one hallmark of a professional community. They suggest that the members of that profession reached consensus regarding professional standards and values and that members agreed to abide by those standards. They may also help create cohesion and professional identity. These codes may allow the association to impose minimum standards and consistency on member behavior. Although there are legal issues regarding enforcement, some professional associations suspend the membership of those individuals who violate ethical codes. Professional groups, such as in accounting, medicine, law, nursing, education, government, psychology, and public relations, have generated sophisticated ethical codes and associated standards for professional conduct.

Associational and professional codes for communication professionals have been used for several years. These include codes for journalists, marketing and advertising professionals and broadcasters, as well as public relations. The Public Relations Society of America, the International Association of Business Communicators, and the International Public Relations Association all developed elaborate associational codes for the public relations profession. These codes embody a variety of professional values and standards and are used to judge and sometimes publicly sanction member behavior. Public relations codes are grounded in larger communication values, such as free speech and free access to information, honesty and truthfulness, and fairness. Public relations codes of ethics were particularly important given its somewhat sordid early history of manipulative and deceptive practices. Ethical codes have helped public relations practitioners clarify professional expectations, maintain higher standards of professional conduct, and, in general, elevate the reputation of the profession.

Although ethical codes are clearly very popular, some critics described them as worthless

exercises in vagueness, irrelevance, and mere window dressing largely designed to avoid responsibility and legal liability. Some critics have even called ethical codes exercises in deceptive public relations. It is optimistic to expect a code of ethics to resolve complex ethics dilemmas and competing values. Codes of ethics, at the very least, however, elevate the level of debate and discussion regarding ethics and lay down a formal record regarding those standards and values to which the organization or professional community aspires. They may enhance the quality of decisions and behavior and provide a basis for making ethical judgments. Although codes are a critical component in improving professional and organizational ethics, they cannot alone be expected to ensure ethical conduct.

CODES OF PUBLIC RELATIONS PRACTICE

Codes of public relations practice are formalized statements of professional obligations, standards, norms, and conduct adopted by the professional associations of public relations. One of the first initiatives of the Public Relations Society of America (PRSA) was to establish an ethical code of practice for its members. The desired outcome of this code was to establish clear standards for practitioners, clarify these standards for management, and distinguish ethical public relations professionals from those who engage in deceptive and unethical communication. The importance of codes has not diminished since the creation of the PRSA code. A survey conducted by PRSA in 2000 found that half the members have at some point felt “an extraordinary amount of pressure” to jeopardize their ethical standards (Fitzpatrick, 2002b, p. 119).

Establishing a code of professional conduct and social responsibility is essential because “business exists at the pleasure of society, and its behavior must fall within the guidelines set by society” (Daugherty, 2000, p. 389). Robert L. Heath (1997) explained that public relations specialists are active players in the process of determining social responsibility; “through their comments—as well as actions that reveal their commitment to mutual interests—companies help shape the standards by which they are judged” (p. 132). Standards of social responsibility have increased as activist and watchdog groups have called out organizations seen as not adhering to those standards.

Codes of practice allow practitioners to move beyond relying on “merely subjective judgments” (Day, Dong, & Robins, 2000, p. 406). Patricia A. Curtin and Lois A. Boynton (2000) found that “codes also may reinforce ethical expectations to public relations novices and deter government intervention, thereby enhancing professionalism” (p. 415). The perceived benefits of such codes is manifested in the fact that businesses have “increasingly developed their own codes of ethics and have hired ethics officers to establish standards for what is right and wrong, or good and bad, within the organization” (Leeper, 2000, p. 435).

The three best-known codes for public relations are PRSA's Member Code of Ethics; the International Public Relations Association's (IPRA) three related codes, known as the Codes of Venice, Athens and Brussels; and the International Association of Business Communicator's (IABC) Code of Ethics for Professional Communicators.

PRSA offers the most detailed and complex code (first adopted in 1950) of the three organizations. Its current version, adopted in 2000, features six core values and six code provisions. The values include advocacy for clients and an open marketplace of ideas, honesty, expertise, independence in the form of objective council and personal accountability, loyalty to both clients and the public interest, and fairness. The six code provisions are composed of free flow of information, competition among professionals in a manner that serves the public interest, disclosure of information in a manner that builds trust with the public, safeguarding confidences to protect privacy rights, avoiding conflicts of interest, and enhancing the profession through building trust in all levels of interaction. The code ends with a brief mention of enforcement. Members are asked to sign a pledge to uphold the code with the understanding that "those who have been or are sanctioned by a government agency or convicted in a court of law of an action that is in violation of this Code may be barred from membership or expelled from the Society" (Fitzpatrick, 2002b, p. 135).

IPRA's first International Code of Ethics, the Code of Venice, was adopted in 1961 and revised in 2009. Two subsequent IPRA codes were developed, the Code of Athens in 1968 and the Code of Brussels in 2007. The Code of Venice is composed of 14 general aspirational provisions addressing issues of conduct toward employers and clients, conduct toward public and the media, conduct toward colleagues, and conduct related to digital communication. Provisions are grounded in principles of fairness, conflict of interest, avoiding misleading and false information, and respecting the integrity of communication channels. The second code, the Code of Athens, references the United Nations Charter and its principles of fundamental human rights and human dignity and worth. The 14 provisions include general aspirational provisions as well as more specific behavioral requirements. The code repeatedly advocates preserving

the human rights entitled by the Universal Declaration of Human Rights. The code asks professionals to perform their duties within the moral principles and rules of the Universal Declaration of Human Rights, to uphold human dignity, to recognize the rights of all parties involved to express their views, to act in a manner that is respectful of the parties involved—including the interests of concerned publics—and to show loyalty and integrity in order to keep the "confidence of clients or employers, past or present, and all the publics that are affected" (Matrat, 1968). Finally, the code asks professionals to refrain from "subordinating the truth," circulating information that is not based on "ascertainable facts," taking any action that is "unethical or dishonest or capable of impairing human dignity and integrity," and using exploitive techniques "to create subconscious motivations which the individual cannot control of his/her own free will and so cannot be accountable for the action taken of them" (Matrat, 1968). The final IPRA code, the Brussels Code (2007), was designed to address the public affairs function sometimes associated with public relations. This code includes 12 general principles, including integrity, transparency, dialogue, and accuracy.

The IABC Code of Ethics for Professional Communicators has 12 articles and does not include a provision for enforcement, but it seeks compliance through promotion. The code is grounded in three principles: Professional communication is legal, ethical, and in good taste. This code explicitly refers to "honest, candid and timely communication," "free flow of information," "free speech," and "access to an open marketplace of ideas." It addresses confidentiality and conflict of interest and challenges professional communicators to be honest, both with others and with themselves.

While the PRSA, IAPR, and IABC codes share basic values of professional integrity, honesty and fidelity to basic processes of communication, there is debate over the proper function of professional codes. Some argue that effective codes should "provide the grounds for charges of wrongdoing and defenses" (Day, Dong, & Robins, 2000, p. 406). From this perspective, critics argue that most professional codes of practice are "vague, unenforceable, or applied inconsistently" and that they cannot account for the diversity of views in a globalized society (Curtin & Boynton, 2000, p. 415).

Evidence supports claims that professional codes are difficult to enforce. For example, K. R. Fitzpatrick (2002a) pointed out that only “five formal sanctions were imposed against members [based on violations of its code] as a result of PRSA investigations from 1954 to 2000” (p. 105). She argued that “unless one assumes that most of the allegations were groundless, the PRSA enforcement system was clearly ineffective in adjudicating ethical misconduct” (p. 105). In response to such criticism, PRSA’s code revision in 2000 moved away from enforcement toward inspiration as a means for influencing member behavior. Fitzpatrick (2002b) explained that the revised code of PRSA, like the code sponsored by IABC, is “aspirational and educational, designed to motivate ethical behavior rather than punish unethical misbehavior” (p. 111).

Another concern is that professional codes of responsibility are so vague that they are of limited value to practitioners. For example, Curtin and Boynton (2000) explained that the PRSA code “proscribes lying,” but it fails to provide “clear guidance on when withholding information is justified” (p. 415). Consequently, some practitioners have called for operational definitions in the code that clarify the standards and leave less ambiguity. In contrast, other practitioners argue that codes simply cannot “encompass all potential problems” and that “if they are too detailed, then they might be inflexible and unlikely to be read” (Daugherty, 2000, p. 397). Others maintain that some degree of ambiguity is an inherent part of public relations activity and that ethicality of ambiguity is dependent on the intent of the communicator.

A final concern involves the capacity of professional codes to account for the diversity of the multiple cultures that are involved in international business activity. With the advent of globalization, some practitioners assert that professional codes are “unlikely to gain wide acceptance” and that such codes are “so broad as to lack pragmatic application” (Curtin & Boynton, 2000, p. 416). Thus, IABC and IPRA emphasize sensitivity to intercultural issues. These provisions encourage practitioners to alter their practices to avoid insult or insensitivity to members of any culture and to promote universal human rights.

Ideally, codes of professional practice provide practitioners with objective means for proactively

assessing their behavior as they engage in their profession. In response to such concerns, codes established by PRSA, IAPR, and IABC, among others, strive to meet the challenges and evolving standards for ethical communication.

COLLABORATIVE DECISION MAKING

Collaborative decision making entails working together rather than independently in a decision making process. Although it can refer to as few as two individuals working together to make a decision, collaborative decision making in public relations typically refers to organizations working together with one or more external publics in a shared decision-making process. Common contexts for collaborative decision making in public relations are community relations and employee relations, and instruments of collaboration range from citizen surveys and public meetings to negotiations, mediations, and search conferences. Done well, collaborative decision making can lead to greater trust among participants and higher quality outcomes that a public views as more acceptable and legitimate than decisions where publics were not involved. Done poorly, collaborative decision-making efforts can leave participants feeling used, undervalued, and distrustful of future interactions.

The spirit of collaborative decision making is evident in early democratic principles, such as the right of citizens to have a voice in decisions that affect them. Early examples in the United States include the ubiquitous town hall meeting, where colonialists debated the future of the fledgling nation. The freedom to share in decision-making efforts has not always come without a struggle, however, as evidenced by the women's suffragist movement to earn voting rights or the labor movement to earn collective bargaining privileges. In response to greater calls for collaborative decision making, the latter half of the 20th century saw more legislation guaranteeing the right of citizens to participate in government-sponsored decision-making

processes. Private organizations also experienced greater protest from publics that resisted being excluded from decisions that affected them.

Today, the techniques used for collaborative decision making are varied and can be targeted at internal as well as external publics. Because different techniques produce different outcomes, choosing the appropriate technique requires public relations practitioners to consider the context and goals of the collaboration. One of the first considerations entails who will have the final decision-making authority. The degree of collaboration in a decision can range from consultation and advisement to full-fledged partnership and control of the decision. Ensuring that all participants in a collaborative decision-making process know from the beginning their likely impact on the decision reduces the potential for later misunderstandings about how decisions were made. Table 1 provides descriptions of several techniques available for collaborative decision making. The table includes typical participants of the techniques as well as typical impacts participants have on decisions.

As the table illustrates, public meetings involve collaborative decision-making techniques where participants act in more of a consultant or advisory role. Rather than making a decision at the meeting, participants typically provide information or feedback to meeting organizers, who then make a decision sometime after the meeting. Benefits of public meetings are that they are open to any member of the public to attend; therefore, decision makers can often access a wide range of knowledge from people who attend. Drawbacks include the sometimes limited nature of collaboration, which may frustrate meeting attendees who want a greater role in the decision-making process. Biased representation is also a frequent criticism of public meetings, since only those most interested in the decision—though not necessarily most impacted by the decision—typically attend.

Advisory committees and advisory panels are also methods of collaborative decision making, where publics serve as consultants to the organization. These methods differ from public meetings in that participation is usually limited to participants who have been purposively selected for their expertise or ability to represent a particular viewpoint. For instance, the U.S. Food and Drug Administration (FDA) relies on its many advisory committees to

Table I Common Techniques for Collaborative Decision Making

<i>Techniques</i>	<i>Participants</i>	<i>Primary Purpose</i>	<i>Typical Public Impact on Decision</i>
Public meetings (public hearings, availability sessions, scoping sessions)	Open to a wide range of self-selected individuals	To provide information and obtain feedback	Limited—public serves primarily as consultant to organization, which is not obligated to follow recommendations
Advisory committees (advisory panels, advisory boards, citizen juries)	Individuals having some expertise or characteristics vital to the issue	To evaluate the situation and provide recommendations over a period of time and multiple issues	Limited—public serves primarily as consultant to organization, which is not obligated to follow recommendations
Citizen surveys (public opinion polls)	Representative sample of stakeholders	To assess attitudes from affected individuals who may not otherwise participate in the decisions	Limited—public serves primarily as consultant to organization, which is not obligated to follow recommendations
Workshops (study circles, deliberative polling, roundtable discussions)	Interest group leaders, experts, officials	To bring members of the public and organization together in a working session	Mixed—organization is not obligated to follow recommendations
Referenda (ballots)	Self-selected sample of registered voters	To make a choice about whether to approve or disprove the issue on the ballot	Substantial—in most cases, votes are binding
Search conferences	Wide range of individuals representing stakeholders internal and external to organization	To identify shared goals and strategically plan ways of attaining them	Substantial—participants share responsibility for making and implementing decisions
Negotiations (collective bargaining, alternative dispute resolution, arbitration)	Individuals directly and/or legally involved with the issue	To find mutually acceptable solution	Substantial—in most cases, results are binding

evaluate research and make recommendations about issues related to foods, drugs, biologics, and medical devices. The FDA specifically chooses members for their expertise, and members meet frequently over a period of years to assist the FDA in its decision making. As with most advisory panels or committees, the FDA is not obligated to follow its committees' recommendations.

Other techniques in which external publics typically have less direct impact on decisions include citizen surveys and workshops. Surveys can provide

useful input from a representative sample into a decision-making process, although some people criticize that surveys only provide a "snapshot" of opinions at a particular moment. In response, deliberative polls are a type of workshop where a representative sample is selected to attend an intense discussion, often over a weekend or other three-day period. Participants complete questionnaires at the beginning of the workshop and at the workshop's end. Supporters of this technique argue that this provides a truer gauge of public opinion as if the

public had access to the available expertise on the issue. Both citizen surveys and workshops (with or without surveys) are typically used as a component of a larger decision-making process; therefore, their impact on the final decision will vary.

Negotiations, referenda, and search conferences are collaborative decision-making processes where external publics have comparatively more control in formulating final decisions. Negotiations entail participants working together to find some agreeable solution. Referenda are essentially ballots where individuals cast their input on a decision using a formulized vote-taking process. Search conferences are large gatherings where people work together to identify shared goals and strategize ways to reach them. Although serving different needs, negotiations and search conferences both have the advantage of face-to-face deliberation, which referenda do not, and many view face-to-face deliberation as an important precursor of successful collaborative decision making.

The aforementioned techniques represent commonly used processes of collaborative decision making. There are many variations among them and this list is not exhaustive. Organizers can also use more than one technique as part of a decision-making process, such as when public meetings are held to keep a more general audience apprised of a negotiation's progress. In addition to the processes themselves, many guidelines exist to enhance interaction in group decision making. Although exploring these guidelines is beyond the scope of this entry, there is some suggested research listed in the Further Readings.

When planning collaborative decision-making efforts, public relations practitioners should also consider legal, practical, logistical, and philosophical issues. One of the first factors is whether collaboration is legally mandated or conducted voluntarily. This is important because mandated collaboration could involve additional requirements. For instance, legally mandated government-sponsored public meetings typically occur at a specific time in a decision-making process. Although this is not always the case, mandated meetings also tend to be more formal than non-mandated meetings. On the plus side, the formal procedures that accompany mandated collaboration can help to ensure that the process is viewed as fair by all parties. However, the formality of

some meetings can leave some participants feeling constricted in how they can contribute. Finally, some publics can view an organization suspiciously if it only seems to be collaborating because the law says it must. In comparison, if an organization is voluntarily collaborating with publics in a decision, publics can interpret this meeting as more of a "goodwill" effort than if collaboration was required.

Practical issues relate to the topic of the collaborative decision-making effort. For instance, decisions that deal with highly technical topics may hinder participation from nontechnical publics. This may be most apparent in techniques geared to wider, more general audience participation, such as public meetings and public hearings. To offset the power imbalances that can arise from this situation, practitioners often provide nontechnical audiences with access to unbiased, technical support. The U.S. Environmental Protection Agency, for example, provides Technical Assistance Grants up to \$50,000 to communities to assist them in participating in decisions about eligible Superfund sites.

Logistical issues relate to the implementation of the decision-making effort. For instance, if the forum for collaboration is a public meeting, logistical issues include choosing the location, timing, and length of the meetings; soliciting participants and coordinating schedules; and preparing appropriate handouts. Choices about timing and location of meetings can send signals to participants about the degree to which their attendance is valued. Meetings held during holidays or at remote locations, for example, can result in lower turnouts for reasons unrelated to the issue at hand. In addition, if poor scheduling results in a lack of attendance, this can detract from the credibility of the process. Meetings that occur late in the decision-making process can also leave participants feeling dissatisfied and angry.

Philosophical issues refer to the incentives for participants to collaborate. Participation scholar Daniel Fiorino recounted that traditionally people argued that decisions—especially technical ones—should be left up to administrative officials, who would consult as necessary with the appropriate experts, elected officials, and other representative interest groups. He summarized the argument against such an arrangement as having normative, substantive, and instrumental

qualities. The normative argument states that individuals have a right to participate in decisions that affect them and excluding them from the decision-making process thus violates democratic ideals. The substantive argument states that input and knowledge from nontechnical audiences can be as sound, or more sound, than experts' or officials' knowledge or input. For instance, local groups could have a much greater sensitivity to contextual factors, such as culture, which can influence the successful implementation of decisions. Finally, the instrumental argument states that involving individuals in the decision may decrease conflict and increase acceptance of decisions.

As noted in the instrumental argument, when properly executed, collaborative decision making can have the added benefit of reducing conflict among organizations and publics. This requires, however, an acknowledgment of the role that power and control play in the decision. Not everyone is inclined to collaborate with their internal or external publics, preferring to follow an elite model of decision making. Even when parties choose initially to collaborate, at some point, discontinuing collaboration could be strategically better for one or more participants. Roger Fisher and William Ury of the Harvard Negotiation Project coined the term BATNA to refer to the state when the incentives to act unilaterally exceed the incentives to collaborate. BATNA refers to the Best Alternative to a Negotiated Agreement. Before coming to the negotiation table, shrewd participants have identified their BATNA as well as attempted to learn the other side's BATNA. Collaboration does not necessarily mean compromise or accommodation, especially if participants have identified their BATNA. However, scholars have suggested that parties in a negotiation or conflict should try to identify shared interests in efforts to reach some type of agreement.

Parties attempting to reach some type of agreement can consider the use of traditional or contemporary mediation. The contemporary model of mediation has gained prominence in recent years among some of the people who believe that unaffiliated third parties have biases that prevent them from effectively fulfilling the traditional role as outside, disinterested experts. A contemporary mediator tends to be an insider to the context,

rather than an outsider, and acts in a way that shows his or her passion or deep commitment to the involved parties rather than approaching the situation with a neutral demeanor. In the contemporary model, a mediator's credibility comes from his or her specialized knowledge about the situation. For example, a public relations professional at the national level of a multi-tiered advocacy organization could serve in the contemporary mediation role by facilitating collaborative decision making between one of its state organizations and one of the state organization's affiliates. The public relations professional is deeply invested in his or her relationship with both parties and is committed to finding a mutually beneficial outcome. This person approaches the situation with specialized knowledge of the tensions that can exist in this type of situation. Regardless of the mediation model, a mediator's credibility can influence the quality of the collaborative decision making and, ultimately, whether a mutually beneficial solution can be reached.

There are several ways to evaluate the effectiveness of collaborative decision-making techniques. Some of the criteria focus more on process-oriented variables whereas others examine outcomes. Process-oriented criteria examine the success of the implementation effort, including the number of people who participated, the degree of interaction among participants, the fairness of the procedures, and the length of time people deliberated. Outcome-oriented criteria examine the results of the procedures, including the quality of the decision, whether the decision is viewed as fair or legitimate by participants, and participant satisfaction with the decision. Recently, more attention has been given to long-term outcomes, including relationships between organizations and their publics. For example rather than viewing collaboration as simply a one-time event, long-term outlooks consider the likelihood that additional interaction will occur and therefore pay attention to ways to increase trust among participants.

COLLATERAL

Collateral is a term used to describe promotional materials accompanying an advertising or public relations campaign. Collateral most often includes any print or visual work done in addition to advertising in its traditional form (i.e., print advertisements, radio spots, and television commercials). Examples of collateral materials include newsletters, brochures, pamphlets, fliers, handouts, table tents, cards, ad reprints, direct-mail pieces, catalogs, booklets, magazines, posters, signage, PowerPoint presentations, position papers, backgrounders, websites, displays, and exhibits.

To be effective, collateral materials must meet an objective and communicate directly to a targeted public. Common objectives include increasing awareness of a product, service, or cause; educating audiences about an organization's stance on a particular issue; reinforcing a brand's image; communicating key message points to a particular group of stakeholders; and informing customers about the benefits of a product or service.

Collateral materials can be distributed directly to consumers in person, through the mail, or online. Public relations practitioners who work in

marketing communications are often responsible for collateral materials that support the marketing or sales function. They develop customer newsletters that are more sales-oriented, brochures that explain product features, and magazines geared toward the buyers of a product or service. These practitioners also ensure the proper implementation of the corporate identity system throughout all collateral materials, which may even include posters, fliers, postcards, and pages on the Web.

A brochure is a printed piece of collateral material used for public relations, advertising, and marketing purposes. Brochures are considered a communication tool or tactic and a form of direct media (i.e., fliers, newsletters, posters), which reach their audiences through distribution channels other than mass media (i.e., newspapers, magazines, radio, television). Other terms used to describe brochures are pamphlets, considered a simple version of a brochure, and booklets, which are brochures produced in small book-like formats.

Every organization, whether corporate or nonprofit, needs brochures to convey key messages to particular target audiences. A brochure is a tactic with a specific objective. For example, brochures can educate an employee audience about company policies, inform customers about new products, or encourage members of a community to use a program offered by a nonprofit organization. Brochures communicate a sizable amount of information to a single reader at a handheld viewing. An orderly sequence of information is presented in stages through panels using a common design thread that visually connects all of the panels and helps entice and sustain the reader's attention.

A newsletter is a type of publication produced most often by public relations practitioners. Almost all organizations—nonprofit and for profit—create and distribute newsletters to members of their key audiences. With the development of desktop publishing, newsletters have grown in popularity. Although they share similar traits with magazines and newspapers, newsletters are smaller, less formal publications that are directed toward a specific audience, such as employees, customers, donors, volunteers, or shareholders.

Collateral services is an agency term often used to describe noncommissionable forms of service, such as the creation of sales promotion materials, new product studies, research, and merchandising.

These types of services are usually performed on a negotiated fee basis rather than a percentage of an advertising media buy.

COLLEGE AND UNIVERSITY PUBLIC RELATIONS

Colleges and universities engage in public relations in order to manage their relationships with key constituencies. Their public relations activities typically are divided into three areas: news, development activities, and alumni relations. The news function is part of a university news service housed under the rubric of university relations or external affairs; development, also called advancement, is located within an office of development, donor relations, or a university foundation; and alumni relations work is by and large conducted within an office of alumni affairs, though often in a partnership with development.

Much of the difficulty in managing public relations is the diverse constituencies to whom a multifaceted educational institution has to address and respond. Not only must a college or university deal with internal publics, such as faculty, staff, and administrators, it also must manage external constituents as broad and diverse as parents, alumni, trustees, clubs, community and business leaders, neighbors, athletic boosters, legislators, governmental agencies, unions, accreditation agencies, as well as area employers who hire graduates. With such a task in mind, universities face a complex public relations environment as they seek to create a distinct brand or narrative story for their institution.

University Relations

The principal location where the public relations work of an educational institution is completed is commonly called university relations. As such, one of the major components of public relations is a news service whose job it is to communicate stories that originate from the campus. University relations officials do this by responding to calls from media who need information, as well as fielding inquiries from the general public. This information takes the form of news releases and feature stories about significant episodes in a university's life, such as hiring a new president or a building dedication; regular occurrences, such as publication of the dean's list or annual commencement ceremonies; as well as newsworthy research and creative activities by faculty and staff members. In larger colleges and universities, intercollegiate athletics typically disseminates sports news separately from the central university news service, usually through a staff led by a sports information director.

As part of its news service, many universities also produce news calls—prepackaged news stories disseminated throughout a state or region and accessed by broadcasters—as well as make their news available through RSS feeds or Twitter accounts. In addition to external efforts, university relations seek to communicate with internal publics through print and electronic newsletters and other media. The chief spokesperson for the university is housed within a university relations department.

A second area of work in university relations is that of special events management. An educational institution is overwhelmed with special events—which can include major grant announcements, technology transfers, new building groundbreakings, orientations, homecoming events, campus races, as well as events that commemorate a university's founding.

A third area of effort is graphic arts and Web design. Such work usually includes the control of the presentation of the institution's brand standards, such as its name and logo, project planning, design and layout assistance for the many places across campus that need brochures and other promotional materials, and a great deal of photography, whether documentary, news-related, or an updating of the faculty and administration photo files. In addition, the development of college and university webpages normally falls under the purview of university

relations, in that this is an area integral to the communication of the university's brand.

A fourth area of work by university relations personnel is the creation and production of university publications, for example view books or alumni or research magazines. Other types of materials produced by university relations are fact books, expert guides, and annual reports.

Finally, additional tasks that fall under the purview of university relations are the development of a campus-specific style manual, offering editorial assistance to departments, engaging in crisis management when matters do not go so well, as well as providing media training to faculty and staff.

Development

Development is a second distinct public relations activity by colleges and universities. The goal is to secure the future of the institution by engaging in systematic efforts to increase financial support. Colleges conduct fund-raising activities to support their endowments, recruit faculty by creating "named" chairs, increase financial aid for students, as well as build and equip new buildings and renovate old ones. Gift giving more often than not is organized into levels that offer increased ranks of exclusivity in exchange for larger dollar amounts.

While always an important part of educational public relations, with the national trend of reduced state funding as well as the variable nature of the business cycle, the need to develop potentially new sources of revenue has taken on an added importance. Consequently, it is becoming increasingly common for universities to engage in major capital campaigns, which in the case of large universities often total over \$1 billion. Indeed, the last few years have witnessed the rise of the *permanent campaign*, in which universities engage in continual and ongoing comprehensive campaigns.

Development activities tend to fall into three types: annual funds, major gifts (including planned giving), and corporate and/or foundation relations. Annual funds consist of the ongoing solicitation of monetary gifts through email, letters, or a phone-a-thon that place an emphasis on small to medium-size gifts. Such gifts are important beyond their monetary value; many institutional rating agencies judge alumni involvement based on participation in annual giving.

A second area of development work is in the area of major gifts. Here development officers frequently spend a number of years cultivating donors with substantial assets in order to lay the groundwork for a direct request by the president or another senior academic official. An important component of major gifts is the use of planned giving specific to people who can make sizable charitable gifts through their estates.

The final area of development work, corporate and foundation relations, is designed to facilitate advancement activities by developing relationships with corporations and nonprofit foundations. Many companies that hire a large number of an institution's graduates or benefit from research partnerships find it in their best interest to aid in the development of university programs, by donating or purchasing technology and equipment, underwriting student or faculty travel, and funding research. Foundations also are an option of universities to solicit support for programs or facilities that serve the priorities of those grant-making agencies.

Alumni Relations

A final area of public relations by educational institutions is alumni relations. It deals with a college or university's efforts to keep in contact and facilitate healthy relationships with a critical public—its alumni.

To develop and maintain pride in an institution, colleges and university alumni associations carry out a variety of public relations activities. One is to facilitate the ongoing communication between school and alumni. To this end, alumni associations publish magazines and electronic newsletters and/or websites that keep alumni updated on significant university activities and career milestones in the alumni ranks. Individuals in alumni relations also host a large number of special events, particularly during the fall (i.e., homecoming). Such meetings are not always located on campus; typically alumni relations personnel make efforts to meet with chapters in major cities, and in some cases, overseas. Other types of organizational events are the creation of specific societies of alumni. They are alumni joined by a common interest or theme, such as those who worked at a campus radio station, those from a close-knit or well-known program, or those from a specific ethnic group.

Alumni often help the institution in tangible ways. Many universities seek the political support of their alumni, frequently in the form of organizing a legislative network to lobby for state support of their programs. Oftentimes alumni also get involved by meeting and recruiting potential students. Recent developments in this area include the creation of mentoring programs to help young professionals get established in their careers.

Universities help their alumni stay in contact through the creation of alumni locators and directories; this helps strengthen ties to their alma mater. Finally, universities use alumni relations as a vehicle by which to recognize their distinguished graduates, usually in the form of distinguished alumni awards. These awards serve as the foundation for future development opportunities for the institution.

COLORADO COAL STRIKE

The bitter strike waged against the coal operators of southern Colorado in 1913–1914 was one of the first major tests of the emerging field of public relations in the United States.

The United Mine Workers of America (UMWA) sought to organize the immigrant workers who worked for some 70 companies in the state. However, the largest and most influential coal operator was the Colorado Fuel & Iron Company (CF&I),

which was 40% owned by John D. Rockefeller Sr., scion of the Standard Oil Trust. Rockefeller took comparatively little interest in the company, which he invested in as a favor to railroad tycoon George Gould. The Rockefellers actually intended to sell their stake in CF&I as soon as market conditions improved, but events on April 20, 1914, squelched any hope of that occurring.

On that Monday morning, as the strike ended its seventh month, a gun battle broke out between Colorado militiamen and armed strikers who had been evicted from company-owned houses and were living in a tent colony near Ludlow, Colorado. Accounts vary about how the skirmish began, but by the end of the day at least eight men and one boy had been killed by gunfire before the tent colony burned to the ground. However, the real tragedy of the “Ludlow massacre” was the suffocation deaths of two women and 11 children who were consumed by smoke after hiding from the crossfire in earthen pits below ground.

The union, aided by sympathetic and sensationalistic newspapers in Denver, quickly blamed the entire affair on Rockefeller and his son, John D. Rockefeller Jr., who had assumed responsibility for the family’s business affairs. Although they were 1,500 miles away from the incident and had not been in Colorado for 10 years, the Rockefellers were labeled as personally responsible for the strike, for the attack by the militia, and for the deaths of innocent women and children.

Newspapers across the country carried glaring headlines for the first several days about the tragedy, but the real pressure came as newspapers in New York and the East covered efforts by Congressman Martin Foster and President Woodrow Wilson to seek a settlement of the strike. Rockefeller had steadfastly refused to meddle with the local managers who, like their counterparts in all other Rockefeller investments, were allowed and expected to operate the day-to-day business. CF&I was a member of a mine operators association that staunchly opposed union recognition, particularly any union led by the leaders of UMWA District 15.

Rockefeller told a congressional subcommittee in early April 1914 that he was not opposed to unions, but JDR Jr. (and presumably his father) staunchly believed philosophically that men should not be forced to join a union and should be able to work anywhere they wished. About the

strike, he had told the committee prior to Ludlow, "My conscience acquits me." Those words would haunt him.

The Rockefellers were helplessly sucked into the fray. A well-oiled publicity campaign was launched by Walter H. Fink, publicity director of the UMWA in Colorado. Protests were also organized in Denver by journalist George Creel and in New York City and Tarrytown, New York (home of several Rockefeller estates) by Upton Sinclair. The socialist writer also picketed the Rockefellers' office at 26 Broadway and went to jail instead of paying a small fine in order to generate even more sympathetic press coverage. The Rockefellers received death threats from the radical members of the Industrial Workers of the World (IWW). Sunday services at their church were disrupted. Later, a bomb intended for the Rockefellers exploded in a New York tenement house and killed four suspected protesters.

Rallies were organized in cities around the country, ministers lashed out from pulpits across the country about the brutality in Colorado, and a delegation of miners' wives toured Washington and New York to tell their tales of woe. The Rockefellers were bolstered by positive letters of support from many business people, but crank letters containing threats were also received. For nearly two months, their family homes were under armed guard.

Public Relations Response

After six weeks of intense pressure, John D. Rockefeller Jr., and his staff desperately sought ways to set the public record straight, to rectify the damage to the family's name, and to solve the underlying problem between labor and capital. Therefore, in early June 1914, JDR Jr. enlisted the aid of two consultants, publicist Ivy Lee and industrial relations specialist William Lyon Mackenzie King.

Lee is often referred to as the father of modern public relations, although he always used the term "publicity" to describe his work. Lee was special assistant to the president of the Pennsylvania Railroad and, in addition to his regular job, assumed the job of helping one of the nation's most powerful families.

Lee set out to tell the Rockefellers' side of the story by issuing a series of 15 bulletins that were

distributed to as many as 40,000 opinion leaders across the country. The bulletins detailed previously untold aspects of the strike favorable to the coal mine operators. He also sought publicity opportunities for the bulletins to appear in newspapers and served as an intermediary with the press. Lee moonlighted for the Rockefellers as a consultant for the remainder of 1914 and then joined the Rockefeller staff for 15 months in 1915 and 1916, before becoming an independent consultant with the Rockefellers as clients.

Lee gained considerable notoriety for himself and for the emerging field of publicity when information about his activities and errors pertaining to the salaries of union officials, which were contained in his bulletins, became disclosed publicly. The United States Commission on Industrial Relations (USCIR), which had been created by Congress to investigate industrial strife, grilled Colorado officials, Lee, and Rockefeller about Lee's activities. Although the USCIR's intent was to put Lee and Rockefeller in an unfavorable light, the USCIR hearings in 1914 and 1915 also shined the light of public scrutiny on the emerging power of publicity before World War I.

While Lee attended to publicity matters, King focused his attention on resolving the labor problems themselves. King proved to be a turn-of-the-century advocate for improvement of management-employee relations and proposed a mechanism for conciliation that would bring labor and capital to voluntary organization during a time before unions were guaranteed the right to negotiate.

King was almost as controversial as Lee. After being hired to study labor relations problems by the then-fledgling Rockefeller Foundation, USCIR investigators quickly questioned whether the non-profit Rockefeller Foundation (which received a special federal charter in 1913) was misusing its resources to benefit the Rockefellers in Colorado. King had been the labor minister in Canada, until 1911, and was distrusted by American union leaders for his legislation, adopted in Canada, that required arbitration of labor disputes before any strike could be called.

The centerpiece of King's work for the Rockefellers was the Colorado Industrial Plan (CIP), adopted in 1915. The CIP became a prototype for company unions as it created mechanisms for

dialogue between management and rank-and-file employees. The CIP served as a model for American industrial relations until 1935, when Congress passed the Wagner Act, which guaranteed the right of unions to engage in collective bargaining. Moreover, King was successful in persuading young Rockefeller and CF&I officials about the need for employees to participate in management decisions and the value of good working and living conditions.

King, who became prime minister of Canada in 1921, proved to be more than a labor relations specialist. He also became a long-time trusted adviser to the Rockefellers. King (along with Lee) helped prepare Rockefeller for grueling testimony before the USCIR, organized a program of social welfare to improve economic conditions in Colorado, and orchestrated a highly successful three-week visit by Rockefeller to Colorado in October 1915. While in Colorado, JDR Jr. saw conditions firsthand, met with miners in their homes, spoke with community leaders, and committed himself to much needed improvements.

Industry and Humanity, a book penned by King while he served as a consultant to the Rockefeller Foundation in 1916–1918, serves as a treatise on labor-capital relationships that is a precursor of modern public relations thought. Among King's key points are the importance of two-way communication and mutual respect, the importance of stakeholders in organizations, and the value of publicity so that the activities of organizations are widely known and misunderstandings are avoided.

COMMENTARY, RADIO AND TELEVISION

Radio or television commentary is a spoken explanation or interpretation of an event, activity, action, occasion, or statement by a person to add depth or context to a broadcast. It is an audible expansion of a topic. A person may offer more information on a topic, perhaps giving an illustration or narrative that adds depth or context. At times, a spokesperson from a public relations firm is asked to provide commentary about an event or occasion involving a client during a radio or television broadcast.

A person delivering such commentary uses words that assist in illustrating a point of view or opinion on a topic that may be important during a broadcast. Commentary may be delivered live or as a prerecorded statement. Often broadcasters include a commentator in a live report to discuss an event that is unfolding as the radio or television broadcast occurs in real time.

Commentary occurs on radio and television in many forms. Commentary about sports may be the most recognized form of this type of discussion concerning an organized event. Professional sports games typically have a play-by-play announcer who describes what is happening on the field of play while a commentary announcer gives context to the broadcast by presenting facts and opinions about players involved and the game in general. Political commentary is also an often-witnessed dialogue on network news radio and television stations. Cable television news networks that operate 24 hours a day host programs that often contain commentary from guests. A topic is presented and various people offer audible context and opinion that may inform and educate the audience.

Producers of broadcast programs select representatives from different political parties to comment on certain high-profile platforms during an election. This is known as radio and television commentary, depending on the format of presentation. For example, in the United States, television commentaries usually occur on election nights. Specifically, media establishments, such as NPR or Fox News, may invite university professors who research politics to comment on trends in voting.

Commentary can also take the form of social commentary. When a representative participates in social commentary, he or she uses the opportunity to share opinions or personal experience with an overarching goal of creating social change or providing education about a topic. In modern times, social commentary often centers on gun control, environmental issues, and equality in gender, race, and sexual orientation.

Another common example of social commentary is a religious sermon. Many television and radio broadcasts offer religious sermons that discuss perceived problems within society. Historically, commentary was presented in the streets or on a street corner before broadcast options were available. It has become more important as mass audiences are now available through radio and television broadcasts.

COMMERCIAL SPEECH

Commercial speech, for purposes of First Amendment law, has been defined by the U.S. Supreme Court as speech that does “no more than propose a commercial transaction” or, on occasion, as expression “solely motivated by the desire for profit.” Commercial speech receives less First Amendment protection than does speech on political or social issues of public importance because it has traditionally been perceived as having less value in a democratic society and because of the desire to protect consumers from fraudulent business practices.

Advertisements for products or services clearly are commercial speech, but communication

materials, such as informational brochures and issue ads, are harder to classify. In 1983, the Supreme Court held that whether material, such as an informational pamphlet, is commercial speech depends on three factors: whether (1) it was meant to be an advertisement, (2) it referenced a particular product, and (3) its dissemination was economically motivated. These three factors would not be sufficient individually to turn the pamphlet into commercial speech, but the combination of all three supported a commercial finding, the Court said. The Court was concerned that holding otherwise would lead advertisers to combine false or misleading product information with social or political information to avoid government regulation. The Court has not addressed the issue since, although it rejected an opportunity to do so in the 2002 case of *Nike v. Kasky*.

Nike, the multinational athletic equipment manufacturer, became the subject of a public debate about the use of sweatshops overseas in the early 1990s. Activist Marc Kasky sued Nike in California under the state’s false advertising statute, claiming that statements made by Nike in the course of its public relations campaign to restore its public image were false and misleading. Nike argued that the statements constituted political speech, not commercial speech, and were therefore protected by the First Amendment and not subject to the false advertising act. The trial court agreed, but the California Supreme Court held that the speech was indeed commercial speech because Nike is a corporate speaker, it hoped to reach consumers with its message, and it discussed its own business operations. The court said that Nike was free to discuss the issue of overseas labor in the abstract, but it could not discuss its own practices unless it was truthful and nonmisleading. The U.S. Supreme Court initially agreed to hear the case, but reversed itself, sending the case back to California for trial. Nike subsequently settled with Kasky, leaving the state’s Supreme Court decision to stand.

In determining whether a government regulation on commercial speech is constitutional, courts apply a four-part test. Under what it is known as the *Central Hudson* (1980) test from the case in which it was first enunciated by the

Supreme Court, courts must consider each of the following:

- Whether the commercial speech is worthy of First Amendment protection (in other words, it must be accurate and for a lawful product or service);
- Whether the government has a substantial interest for regulating the speech (courts usually consider the government to have a substantial interest in protecting the health, safety, welfare, and morals of the public);
- Whether the regulation in question directly advances the government's interest; and
- Whether the regulation is no broader than necessary to achieve the objective (it cannot restrict the speech entirely).

Although the Court applies the *Central Hudson* test to all commercial speech cases, it reaches different decisions depending on the kind of product or service advertised. For example, the Court has strongly supported the right of truthful, nondeceptive advertising—even of “vice” products and services, such as gambling, alcohol, and tobacco—to protection under the First Amendment. Yet, the Court has consistently limited the advertising of professionals, such as lawyers, accountants, and dentists. Professionals may advertise the price of standardized procedures, but not of more complex services. The Court has also restricted the means by which attorneys may communicate with consumers.

The idea that commercial speech is entitled to any First Amendment protection is a relatively recent legal phenomenon. The U.S. Supreme Court did not even consider whether commercial speech was protected speech until 1942. At that time, the Court held that “purely commercial advertising” was outside the protections of the First Amendment. The case arose when a businessman included a political protest on the back of a leaflet advertising his business to get around a New York City sanitary code banning the distribution of leaflets except for those of a political or informational nature.

In subsequent cases, the Court clarified its reasons for denying First Amendment protection to commercial speech. First, the Court was not worried about the chilling effect of regulation on commercial speech. One of the Court's primary

justifications for protecting political speech is the fear that people will stop speaking out against the government if they can be punished by the government for so doing, but according to the Court, ads would continue regardless of whether the First Amendment protected them because the desire of businesses to make a profit is so strong. Second, the Court concluded that it was easier to determine whether an advertiser's claims were true than it was to determine whether allegations against the government were true. Therefore, while society had to tolerate a certain level of false political speech to ensure robust political discourse, society did not have to tolerate false ads.

In the 1960s, however, the Court began to carve out areas within the commercial speech doctrine that had some First Amendment protection. The Court began by distinguishing purely commercial advertising from political advertising. Political speech did not lose its First Amendment protection simply because it appeared in an advertising format, the Court held. Later, the Court found that a newspaper ad for abortion referral services was not “purely commercial” because it contained important factual information clearly of interest to members of the public.

The Court continues to expand its protection for commercial speech, finding that such speech can be as important to people as political speech, especially in terms of their everyday lives. The Court emphasized the right of the consumer to have access to information rather than the right of the business to advertise. It is the communication itself that is protected, not the speaker. Despite the movement toward greater protection of commercial speech, such speech continues to receive less protection from government regulation than does noncommercial speech.

COMMITTEE ON PUBLIC INFORMATION

At the outset of United States involvement in World War I, President Woodrow Wilson issued executive order 2594 to create the Committee on Public Information (CPI). The CPI served two vital functions during the war: as the "propaganda" bureau of the administration and to publicize voluntary censorship of national media. David Lawrence, a former student of President Wilson at Princeton, and Arthur Bullard, a reporter and novelist, suggested to the president that he establish a publicity bureau and cautioned about unnecessary censorship efforts. Bullard's arguments for such an approach started long before the 1917 creation of the CPI, and in the early days of the CPI, Bullard did considerable work to help develop the organization and its materials.

The idea of using a government agency to sell the war to the people was also advanced by journalist George Creel. After his initial meeting with the president, Creel was appointed chairman of the CPI and was granted full executive powers. Stephen Vaughn (1980) noted that "President Wilson trusted him (Creel) and never considered any other person for the chairmanship" (p. 17). Although Creel had the full support of the president, his appointment was questioned by others, who noted his inability to accept criticism.

John Dos Passos (1962) said that while Creel was "a hardworking man with an inexhaustible self confidence, his failing was snap judgements [*sic*]" (p. 301). Creel was an activist Democrat who believed that Woodrow Wilson was one of the greatest men who ever lived. He tended to view individuals in two extremes. Those who agreed with his position on an issue were great; those who disagreed with him were "skunks." In fact, Creel wrote, "It must be admitted that an open mind is

no part of my inheritance. I took in prejudices with mother's milk and was weaned on partisanship" (Dos Passos, 1962, p. 301).

Creel's family moved to Missouri from Virginia after the Civil War. Creel grew up in Independence and Odessa, Missouri. While working in Kansas City, Creel met Wilson when Wilson (who was at Princeton) spoke to local high school students. Creel worked to get Wilson nominated for the presidency and worked for his reelection in 1916. Creel was a journalist who worked on newspapers in Kansas City and New York before returning to Missouri in 1899 to found the *Independent* with Arthur Grissom. Prior to World War I, Creel moved to Denver and wrote for the *Post* and the *Rocky Mountain News* and later served as the police commissioner.

President Wilson noted the importance of strong national support for the war in his draft proclamation by arguing that "the whole nation must be a team." "To turn the whole nation into a team it was not enough to punish the expression of the wrong opinions. It was necessary to disseminate the right opinions" (Dos Passos, 1962, p. 300). To create this teamwork it was essential to promote the war to the American people. Creel was given the job of selling the war to the citizens of the United States and many other nations.

The efforts of the CPI are important because they are some of the earliest examples of a large-scale promotional campaign. Additionally, individuals who worked in the CPI were some of the founding members of what we now call public relations. Indeed, Edward Bernays used his experiences with the CPI to create one of the early public relations firms and to start such an impressive career that he is called one of the fathers of public relations.

Creel and the CPI created a promotional campaign for the United States and the world. This campaign used all the channels of communication available at the time. Various accounts of their activities are reported. The following quote from C. H. Hamlin and Charles F. Dole presented this description of the various CPI divisions and provides some evidence of the scope of CPI's activities:

This "Committee on Public Information" issued 75,099,023 pamphlets and books to encourage the public "morale." They hired the services of

75,000 speakers who operated in 5,200 communities. Altogether, about 755,190 speeches were made by these people known as the "Four Minute Men." Exhibits were given at fairs, and war films were prepared for the cinema. . . . A total of 1,438 drawings were employed to arouse popular hatred. An official daily newspaper was issued which had a circulation of 100,000 copies. A propaganda bureau was established by the United States, in the capitals of every nation in the world except those of the Central powers. (1927, p. 91)

The CPI used the press, films, and public speakers to reach its audience—the nation and the world. Through these various channels they carried the views of the president as articulated by Creel. The activities of the CPI would surely compare with those of any of the largest public relations/marketing campaigns of recent years. A detailed description of each of the techniques used by the CPI can be found in Creel's 1920 work, *How We Advertised America*.

The second major area of effort by the CPI involved its attempts to censor the media. In the first few weeks after the United States entered World War I, President Woodrow Wilson was granted wartime powers by the Congress. However, the ability to censor the press, which he desired, was not included in these powers. Because President Wilson's efforts to obtain formal censorship privileges through the War Powers Act failed, Creel and the CPI assumed the task. Creel's efforts to establish some form of control are not surprising in light of his admiration of the president and his position as the spokesperson of the administration. Creel was President Wilson's link to the Censorship Board.

The censorship efforts focused on voluntary guidelines that publishers were asked to follow. The June 2, 1917, issue of the *Official Bulletin*, a publication of the CPI, provided more than three pages of voluntary guidelines for publishers to follow so that the press could not be used by enemy nations. On page 12 of that issue's discussion of the voluntary guidelines, news was divided into three distinct categories:

Matters which obviously must not be mentioned in print; matters of a doubtful nature which should not be given publicity until submitted to

and passed by the committee; matters which do not affect the conduct of the war, do not concern this committee and are governed only by peacetime laws of libel, defamation of character, etc.

Descriptions of types of news that would fall into each of the categories were provided.

On page 13 of the June 2, 1917, issue, specific regulations were given by the committee, noting that "the suppression of all news matter which is obviously likely to be of direct utility to the enemy is urged and expected." The December 31, 1917, issue of the *Official Bulletin* provides revisions for the earlier guidelines. These revisions, like the initial guidelines, were mailed to all editors.

How successful were these voluntary guidelines? The CPI issued the following statement in the June 14 issue of the *Official Bulletin*. "While 99 per cent of the newspapers of the country are scrupulously observing the rules of voluntary censorship, a certain few are printing daily information that may expose American soldiers and sailors to deadly peril." This quote suggests that the vast majority of papers were observing the voluntary guidelines.

Even though the press privately expressed dissatisfaction over the techniques used by Creel, all papers, even opposition papers, remained respectful of the regulations until the end of the war. Dos Passos (1962) summarized the position of the CPI as an agency of censorship. "The CPI became the fountainhead of war news for the Washington press corps. The existence of an official press censorship was consistently denied, but editors were safer if their materials had passed through Creel's hands" (p. 301).

The CPI and its chairman were successful in establishing censorship guidelines to which publishers would submit. Even though these guidelines were voluntary, adherence to them was almost universal. Publishers soon discovered that it was simply easier to submit news to the committee rather than take a chance of violating the guidelines. Although no official censorship was available, the Espionage Act made it illegal to spread false reports that would hinder recruiting. Those reports that did not match the official releases of the CPI were viewed as false.

COMMODYING INFORMATION

Commodifying information means that organizations focus their information acquisition and public relations efforts on the cost effectiveness or productivity of supplying information to help key markets, audiences, and publics make a wide array of decisions. Many think of public relations as a discipline that provides information. The concept of commodification challenges practitioners to go the extra step of being ever more accountable for the return on investment of acquiring and using information for the interests of building mutual relationships.

People desire information to make decisions they deem valuable. Their desire for information is a function of their involvement, need, or desire to make a decision, according to involvement theory. People experience higher levels of involvement when they need or want to make decisions.

Organizations communicate for two broad reasons: to get out messages (containing information) that management wants to be told and to respond to the needs and wants of markets, audiences, and publics. The desire by management and its stakeholders may or may not be a close fit.

Organizations engage in public relations to supply information to people who want information. Executive management people expect public relations to provide information to targeted individuals to influence their decisions and, often, the choices executives want them to make. For various reasons, executives may want to withhold

information desired by others. Information can drive decisions, whether it is information the organization wants people to have or whether it is information people want.

Typically, it is thought to be more costly to provide people with information the organization wants them to have, if the people do not have some reason for receiving and using the information. This condition leads public relations to be thought of as a mass communication discipline, broadly casting information through the mass media to put it before some small part of the public, even if targeted. People are inundated with information. Thus, attracting attention to information and getting it considered is a serious strategic challenge.

A commodity is something that is bought and sold. It affords ease of transaction and convenience. In the purchase of goods and services, this concept is relevant. Most of the goods people buy are a commodity. It is standardized to make the transaction as easy as possible. In some countries such as the United States, people rarely barter. Goods come packaged as commodities, even fruits and vegetables. This commodification makes the transaction easier, one the buyer may feel he or she has more control over.

Services are also commodified. For instance, routine and even special dental or medical treatments are performed at standard fees. Legal and other professional fees can be commodified so that the purchaser has a reasonable sense of what the service is and what it costs.

As public relations practitioners seek to understand and measure their practice, they should realize the advantages of calculating how much various bits of information cost to acquire and to make available to key publics. Thus, for instance, they can calculate the cost effectiveness of providing such information in an “on demand” format, such as a website, because typically persons who encounter information in that medium are looking for it, rather than randomly skimming the mass media. Members of relevant publics are cognitively involved in searching for, getting, and using key bits of information to make decisions. Information on demand for customers or reporters, for instance, can reduce the cost of disseminating the information.

If businesses, government agencies, or nonprofits attempt to broadly “push” information to markets, audiences, and publics, it is necessarily going

to be more costly in delivery, even if its cost of development remains the same.

This sort of analysis lends itself to standard productivity measures. As a mathematical formula, productivity is the result of output divided by input. If output remains the same (the price charged for a bag of apples, for instance), but costs more (more input) to produce, then productivity declines. If output increases while the level of input remains the same, then productivity rises.

To think in terms of commodifying information, practitioners need to learn to calculate the cost of getting information and providing that information in ways that serve the organization's and its stakeholders' mutual interests.

Output value can be assessed in several ways. One is the reduction in the saved cost of regulation or legislation that is appropriately modified or defeated based on relevant information. Another is the increased marketing impact of getting the right information to the right customers at the right time. A third is the appropriate valuation of publicly held companies because relevant information is available to investors.

COMMUNICATION AUDIT AND AUDITING

A communication audit is an assessment tool used for formative, diagnostic, or evaluative research in public relations. The term *audit*, appropriated from the accounting field, has ambiguous meaning in public relations. Both the trade press and academic texts used the term to describe a wide variety of research approaches with distinct objectives, methodologies, and study populations. Some describe a communication audit as a comprehensive study of all an organization's stakeholder

groups and their perceptions of the organization, whereas others define the term more narrowly. In general, all these approaches refer to a research process designed to identify perceptions of the organization or its communication vehicles and culminate in appropriate recommendations for action to management. Communication audits are commonly used by corporations, hospitals, and other large organizations to assess the organization's image among its employees, customers, community residents and leaders, media, and other key publics. Audits are a standard offering of public relations research firms and larger public relations agencies, although various firms may define their audit services differently.

Typically, the audit process begins with an interview with top management to determine the objectives and focus of the audit, specific issues or questions that the audit should address, and key publics to be audited. Then, appropriate methodologies for each group are selected and research instruments developed. Surveys, focus groups, interviews with opinion leaders, and content analysis of organizational publications and media coverage are common research techniques. Often, a package of several research techniques is employed. Data are gathered and analyzed, and a report is written that interprets the research findings and makes recommendations to management for future actions. The findings of a communication audit may serve as a tool to justify a change in strategic direction, to justify funding for new programs, or to help a public relations program gain management approval for such changes.

Types of Audits

In 1977, Otto Lerbinger identified three distinct categories of audits used in public relations: public relations audits, communication audits, and social audits. These terms continue to be used, albeit somewhat inconsistently, and are joined by additional variations on the audit described in the trade and academic press in subsequent years.

Public Relations Audits

The public relations audit assesses the health of the relationships between an organization and its key publics. This type of audit provides insight into

who key publics are and the images they hold of the organization. Surveys and focus groups are often used to determine key publics' levels of awareness of the organization and its products, services, programs, logos and slogans, or key personnel. Rating scales may be used to measure attitudes toward these, including characteristics that the public associates with the organization. The audit may also ask participants to describe and rate their personal experiences or interactions with the organization. Public relations audits may reveal misperceptions about what the organization is or does and disparities between management's perception of the organization and the way the organization is actually perceived by its publics. Recommendations stemming from a public relations audit might focus on tactics to strengthen relationships with key publics.

Communication Audits

Lerbinger's (1977) definition of the communication audit limited it to research to determine whether messages have actually gotten through to intended receivers. Today, such audits focus on evaluating in the eyes of their intended users an organization's communication vehicles, such as newsletters, annual reports, brochures, press materials, websites, and video programs. Typical research methods include readership surveys, content analysis to identify predominate content themes, and measurement of text readability by using standardized formulas that determine reading difficulty based on factors, such as word and sentence length. Respondents may be asked about their actual use of communication vehicles, their preferences for particular kinds of content, and whether they remember particular articles or acted on information; respondents often rate the effectiveness of various communication vehicles they receive on the basis of accuracy, timeliness, and usefulness.

A communication audit can identify information needs that are not being met, distrust of organizational news sources, preferences for particular communication channels, and whether a message is received, is understood, and provoked action. Results of a communication audit may be used to improve the content, design, and distribution of publications, or to revamp or discontinue communication vehicles that are not achieving desired results.

Organizational Communication Audits

Communication audit is a term also used in the organizational communication field to describe research to assess employees' satisfaction with communication in their organizations. Because employee relations is often a key public relations concern, the organizational communication audit may be implemented by public relations managers. The International Communication Association (ICA) audit is the most widely used vehicle for such an assessment. It asks employees to rate how much information they receive on particular topics, such as job duties, pay, and their own performance, versus how much they would like to receive. Respondents also rate the amount of communication they receive from and initiate with superiors, subordinates, and coworkers versus desired levels. An open-ended portion of the audit asks respondents to describe specific interactions they had where communication was particularly effective or ineffective. The data are used to make recommendations to management and may be used to create a network analysis—a diagram depicting the path and frequency of information flow through an organization.

The organizational communication audit can reveal a great deal about the communication climate within an organization. It can identify problems with communication system design, employee information needs that are not being met, and bottlenecks in the communication flow. A limitation of the ICA audit is that it focuses on the amount of communication given and received; it does not ask employees to evaluate the specific strengths and weaknesses of existing communication vehicles. A multitude of studies employing the ICA audit in a variety of settings over the past three decades have confirmed a significant relationship between the communication climate within an organization and employee loyalty and job satisfaction. Employees' preferred source of communication is nearly always their immediate supervisor; however, employees consistently say "the grapevine" and employee publications are their most frequent sources of information.

Social Audits

A social audit evaluates an organization's social responsibility activities, such as voluntary environmental programs, community education programs,

corporate philanthropy and volunteerism, and diversity initiatives. The audit measures public awareness of these programs and perceptions of the organization's performance as a corporate citizen. Most often, survey or focus group research is used to attempt to quantify the contribution of these programs to the organization's image and perceptions of the organization as a good place to patronize or work. Social audits were common in the 1970s, when they were used to assess corporate America's first large-scale social action programs. However, the use of a *social audit* is less frequent, replaced by more recent techniques associated with the practice of issues management, such as environmental scanning.

Comprehensive Audits

Sometimes the terms *communication audit* and *public relations audit* are used to describe a comprehensive audit that evaluates the organization's entire communication program and assesses the image of the organization based on the perceptions of all key stakeholder groups. Such an audit examines every facet of the organization's internal and external communication activities, along with the impact of these tactics on key publics. Research techniques may include interviews, focus groups, or surveys with all levels of employees, consumers, community leaders and media gatekeepers, and critiques of all materials distributed inside and outside the organization, including newsletters, marketing materials, websites, and annual reports. This type of audit is used to identify strengths and weaknesses in the existing public relations position of the organization, to inform the development of long-term communication strategy, and to provide guidelines for future public relations programming.

Other Types of Audits

The public relations literature also describes "crisis audits" (Littlejohn, 1983) and "risk audits" (Ogrizek & Guillery, 1999), both of which are designed to help organizations identify, prioritize, and respond to potential crisis issues. "Public relations agency audits" (Croft, 1997) are described as internal performance assessments to help public relations firms gauge how well they are serving their clients.

Future Trends

The popularity of audits as a research tool in public relations reflects growing recognition of the need to quantify the value of public relations activities. More frequently, formative and evaluative research skills, such as the ability to design and conduct an audit, are expected of communication professionals. To ensure the acceptance of audits as credible research, knowledgeable practitioners or professional research firms are needed to minimize problems inherent in any type of opinion research, such as those associated with sampling and bias in question design. An additional challenge for practitioners is that top management may not always follow through on an audit's recommendations and make suggested changes.

COMMUNICATION MANAGEMENT

Communication management can be defined as a set of techniques used in public relations and related activities to conduct programs, campaigns, and projects.

Commonalities Across Disciplines

Growing numbers of organizations recognized that various communications disciplines share common purposes and are moving toward the integration of communications functions. This convergence resulted (a) from recognition of common

strategic approaches used by public relations and related disciplines, (b) by the convergence of media and the rise of shared media, such as the Internet, (c) by the blurring of the demarcation of traditional communications disciplines, including the rise of integrated marketing communication, and (d) from efforts by organizations to achieve greater synergy and efficiency and to reduce redundancies and costs in communications operations. This centralization trend is far from complete, however. Most organizations continue to maintain separate functional units devoted to managerial communications, public relations, advertising, and technical communication. In Europe, however, *communication management* is the preferred term for traditional public relations.

In the academic arena, communication management is consistent with the umbrella concept of strategic communication, which examines how organizations use communications across traditional professional disciplines to achieve stated organizational goals and objectives. Stated another way, strategic communication involves an organization communicating purposefully to advance its mission. Both communication management and strategic communication purposely look beyond differences in disciplines to focus on the similarity of strategic approaches found in various disciplines.

Table 1 compares six conceptual approaches to organizational communications that can be incorporated under this umbrella, although the conceptual focus and techniques/tactics that are

Table 1 Six Domains of Communication Management

<i>Domain (Typical Organizational Unit Involved in Communication)</i>	<i>Goal/Purpose</i>	<i>Traditional Techniques</i>
Management communication Leadership and personnel throughout organization	Facilitate operations of organization; promote understanding of vision, goals; communicate information used in day-to- day operations, including customer and vendor transactions and customer and staff training	Memoranda, contracts, meetings, and presentations; internal electronic communications
Marketing communication Marketing staff	Create awareness and promote interest and sales of products and services; attract, motivate, and retain users, consumers, and customers, including intermediaries in distribution channels	Trade and consumer advertising and product publicity; direct response and sales promotion; personal selling; also facilitate communication among customers and consumers through social media
Public relations Public relations or publicity, human resources, finance or government relations staff	Establish and maintain mutually beneficial relationships with key constituencies; includes consumers and customers, as well as investors, employees, community, and government	Publicity and corporate advertising in public media, interactive media, controlled media, events, personal contacts
Technical communication Technical support, training staff	Train people to reduce errors and improve their efficiency in the use of technology and procedures used in performing tasks important to organization	Procedures manuals, instructions; telephone call centers and computer- and mobile-based assistance programs

*Domain**(Typical Organizational Unit Involved in Communication)*

<i>Goal/Purpose</i>	<i>Traditional Techniques</i>	
Political communication Politicians, advocacy groups	Influence voting by general public in elections or decisions by lawmakers or administrators considering legislation or regulation	Political advertising, editorial coverage and editorial page opinions, printed materials, direct mail, get-out-the-vote solicitations/personal contacts; lobbying and grassroots politicking
Information campaigns/social marketing Not-for-profit and governmental agencies	Alter human behavior to reduce incidence of risky behaviors or to promote social causes important to the betterment of community	Public service messages, educational materials, events interventions by professionals, family, and friends

used are often different in each traditional discipline or context.

Communication Management Approaches

Strategic approaches to conducting a public relations campaign date back to at least 1935 when Edward L. Bernays first outlined the components of a public campaign. Since publication of Scott M. Cutlip and Allen H. Center's *Effective Public Relations*, public relations has been described as a four-step process. In 1952, the first edition of the classic textbook described three steps: fact-finding, planning, and implementation or communication, while the fourth step of evaluation was added in the second edition in 1958.

Although this four-step model is preserved as a model of professionalism in programs administered by the Public Relations Society of America (including its professional accreditation and Silver Anvil Awards), modern communication management is grounded in the concept of management by objectives (MBO). This idea, first advocated by management guru Peter Drucker in 1954, posits that all organizational activity should be planned around the attainment of measurable goals and strategies and tactics that can be carefully monitored during execution.

Communications managers typically oversee one of more of the following types of organizational activities:

Programs are long-term efforts to establish and maintain communications between organizations

and key audiences. Programs can include the establishment of *channels* (such as a website), *policies* and *procedures*, and ongoing *activities* (such as events) designed to facilitate communication over time. *Program* is the nomenclature most commonly associated with managerial communication, technical communication, and public relations.

Campaigns are coordinated efforts to promote particular ideas among key constituencies over a specified, often limited, timeframe. Campaigns represent the basic framework used in advertising, political communication, and social marketing efforts. Some communicators prefer to use the term *programs* instead of *campaigns*. The *campaign* term's origin in military strategy implies that a victor must triumph over an enemy in a zero-sum game, whereas many public relations professionals seek win-win solutions.

Projects are limited-purpose activities undertaken to accomplish particular outcomes within an organization. Project management, as a management tool, has received widespread attention in recent years. Unlike a long-term program or campaign, projects are of shorter duration and involve representatives of units working collaboratively to accomplish a complex task. Communications professionals may be participants in, but are not in charge of, various projects—annual reports, special events, websites, and so on. Many projects are undertaken within staffs of communications units.

Roles and Type of Plans

Central to the notion of communication management is planning and organizing a communication effort. The preparation of a formal or written plan is deemed a critical element in effective management. Written plans serve as (a) proposals used to obtain client approval, (b) internal control documents for day-to-day guidance during implementation, and (c) historical records of activities.

Communications managers become involved in the preparation of various keys of planning documents. These include the following:

Strategic plans, which guide the overall direction of the organization or the communication unit for a long-term period (often 3 to 5 years)

Annual plans, which outline specific activities to be taken within an organization's yearly planning cycle

Programs, campaigns, or project plans, which specify efforts to be undertaken to achieve particular outcomes (often without regard to yearly planning cycles)

Contingency plans, which are procedures to be followed in case of possible extraordinary events or crises.

Components of a Program/Campaign Plan

Although the specifics vary by domain, by scope of the activity, and by specific plan type, all communication management plans address the following components. As the section below illustrates, these fall within the four-step framework identified above, but are more specific:

Public Relations Processes and Program Elements

Research

Situation analysis—A description of a problem to be resolved or the opportunity to be exploited, compiled from careful investigation about the organization, its offering(s), the opinions of key publics, and opportunities to communicate.

Planning

Organizational goals—The desired outcome of an organization, stated in specific and measurable

terms, that can be realistically achieved within a specified time frame. These are often stated in terms of activity levels (such as unit sales or revenue), profitability, or efficiency.

Communication objectives—The desired changes in *human behavior* (such as awareness or knowledge, attitudes, or behaviors) that contribute to achievement of organizational goals. Common behaviors addressed include buying, investing, donating, working, and voting. Lifestyle changes might include adoption of particular spiritual or other beliefs, engagement in healthy or satisfying or rewarding activities, or avoidance of risky behaviors.

Action strategies—Recommendations for changes in an organization's offerings, policies, or practices that improve the probabilities of successful communications and thus attaining organizational goals.

Communication strategies—The overall conceptual approach to how communication objectives are to be achieved. Usually, this involves (a) targeting particular audiences—which might be defined as market segments, publics, users, voters, or at-risk populations, as well as intervening publics or influentials useful to teach them; (b) choosing media channels or specific vehicles to reach those audiences; and (c) development of key messages or themes to use in a program, campaign, or project to communicate with key audiences. Themes are typically chosen based on newsworthiness, benefits, and features of an organization's offering, or practical information that people can use to benefit their daily lives.

Execution/Control (Sometimes Labeled Implementation or Communication)

Tactics—The specification of tasks (including activities, events, or the preparation of materials and messages) to carry out the communication strategy. As implemented, the communication quality and progress toward achievement of goals and objectives are monitored.

Staffing—Assignment of duties to specific employees/volunteers, agencies, freelancers, or vendors.

Calendaring—Scheduling of activities based on timely delivery of messages.

Budget—A spending plan that appropriates the financial resources needed to achieve stated communications objectives, estimates costs, allocates spending to specific budget categories, and monitors expenditures to avoid overruns.

Evaluation

Assessment—Predetermined methods for assessing whether a communication effort was successful in attaining the stated communication objectives and organizational goals at the conclusion of the effort.

Accountability

Communication management that follows the MBO approach outlined above places a premium on deploying resources effectively and efficiently with the same rigor and accountability imposed on other unit managers. It rejects erroneous contentions that public relations outcomes cannot be measured. Thus, along with planning, evaluation plays a critical role in the management of communication programs, campaigns, and projects.

Communication managers use five broad categories of measures to assess their effectiveness and efficiency:

Qualitative measures include critical examination of their work product in order to identify deficiencies and opportunities for improvements. These often are for the internal use of the communication unit and are intended to serve as benchmarks for future work.

Output measures examine the materials and message produced in quantitative terms. These involve understanding the extent to which materials or tools were used and exposure to messages by audiences. These measures serve as a proxy (indirect) indicator of an effort's impact.

Activity measures, which have received increased attention in recent years, focus on what audiences do with materials or messages—as intermediate steps that might move them toward taking a desired target. These are most readily evident in assessing new media. Examples include time spent on a website, number of website pages visited, direct replies to email or text messages, the forwarding of messages, blog posts, and the

number of “likes” or recommendations for products or messages.

Impact measures assess directly the achievement of communications objectives (changes in people's awareness or knowledge, attitudes, or actions) as well as organizational goals (achievement of desired sales, contributions, productivity, voting, or risk reduction outcomes).

Financial measures include the contribution of the communication activity to the organization, including return on investment (ROI) and determination of the optimal efficiency when two or more tools are available to achieve similar outcomes.

COMMUNICATION TECHNOLOGIES

Since humans first used sticks and charcoal to augment the human voice and gestures, communication technologies have shaped the form, content, and dissemination of communications. Today, technology has become an increasingly important topic for public relations practitioners who have an ever-increasing array of tools available to them to communicate ideas.

A 2010 review of public relations history by Margot Lamme and Karen Miller Russell chronicled the advent of various communications innovations over the past 2 centuries. The advent of printing with movable type, books, newspapers and magazines, the telegraph, photography and new illustration reproduction technologies, the typewriter, the telephone, the motion picture, radio, and television all altered the nature of advocacy, promotion, and persuasion. Meanwhile, the newest computer- and telecommunications-based technologies have escalated the rate of change in just the past two decades.

Technology in the Workplace

Today work planning and production is centered on computer screens, while much information flows electronically in real time via the Internet and wireless communications. Intranets (password-protected, Web browser-based communication systems) allow employees in scattered locations to seek and share work-related information through a variety of tools (email and text messages, webpages, mobile apps and webcasts, to name a few). People also can work collaboratively using groupware and group decision support systems (GDSS) software. Popular forms of these tools include forums, wikis, and Web conferences. Meanwhile

extranets permit suppliers, distributors, retailers and others to participate in training programs, to collaborate on projects, and to access needed information (such as order processing and inventory data) via secured virtual personal networks (VPNs).

Similar to other organization units, technology has transformed virtually every aspect of public relations work. Public relations research today employs numerous electronic intelligence gathering tools, including Web search engines, proprietary databases, systems analytics, and specialized research software to conduct surveys and content analyses of media and online content. Virtually all public relations messages are produced in digital forms using word processing, database, graphic design, photographic/videographic, and electronic presentation software. Although digitalization also has transformed modern printing processes, an increasing amount of content is distributed electronically in digital formats via the Internet and World Wide Web, telecommunications networks, over-the-air broadcasting and cablecasting systems, and satellite uplinks and downlinks.

Impact on Public Relations

Whether communication technology has improved the effectiveness and efficiency of the public relations practice continues to be debated. However, new communication technologies clearly have

- *Increased the sheer volume of information* public relations practitioners create, distribute, and manage—a trend that requires thoughtful planning, dissemination and archiving.
- *Required organizations to disseminate information using multiple tools* to reach the same audiences they could access using fewer tools only 2 or 3 decades ago. Audience fragmentation has resulted in an increase (versus a decrease) in the amount of staff and other resources deployed.
- *Placed a premium on timeliness*. However, the haste to distribute information immediately often results in the distribution of incomplete or erroneous information and a blurring of time that did not exist previously.
- *Altered audience expectations about the availability of information*. Indeed, audiences demand information on a 24/7 basis, and now

audiences—not organizations—determine when, where, and how information needs be distributed. To ignore audience preferences can compromise access and exposure.

- *Transformed audiences into producers as well as receivers* of public relations messages. Many online and mobile public relations efforts today solicit immediate replies or prompt the audience to forward messages to their friends, rate content, make recommendations, or create user-generated content.
- *Provided mechanisms for dialogue.* Indeed, interactivity allows organizations to engage in two-way communication with constituents but also facilitates communication *among* various constituencies. The downside of this trend can be biased anecdotal feedback and potentially damaging word-of-mouth, rumors, and gossip.
- *Reshaped organization structures and cultures.* Boundaries that once delimited organizations have dissolved. Hierarchies have flattened. Authority has waned in its significance. Learning and intelligence sharing are imperatives. Organizations also are forced to be more open.
- *Changed social values pertaining to proprietary organizational information, confidentiality, transparency, and privacy.* Users now expect organizations to provide advice and information at no charge but also now expect—more than ever before—that organizations will safeguard personal information provided to them.
- *Enabled the easy manipulation and duplication of an organization’s intellectual properties by others,* thus leaving organizations vulnerable to digital attackers, hackers, lurkers, rogues, and thieves.

Technology and Public Relations Messages and Media

Theories of technological determinism suggest that technology shapes the nature of societies, organizations, and the communication process itself. Marshall McLuhan popularized this notion when he observed “the medium is the message” and thus contended that media effects result from the experience of using a particular medium, not its content. Similarly, Joshua Meyrowitz argued that media redefine social geography, while media use patterns among audiences shape group identities, socialization processes, and social hierarchies. Ronald Deibert

similarly suggested that the new media alter how information is disseminated, but also social epistemology (the knowledge shared by people).

Table 1 outlines more than a dozen criteria where public relations tools and media can be differentiated based on their technological characteristics.

Table 1 Technological Considerations in Designing Public Relations Messages and Selecting Media

Primary modality: Ear (sound) vs. eye (text, visuals)

Data format: Digital vs. analog (non-electronic or electronic not using binary code)

Interactivity: High (two-way communication) vs. low (limited one-way feedback) vs. none

Audience processing involvement: High vs. moderate vs. low

Ease of use: Difficult (requires knowledge of software or hardware) vs. easy (limited or no knowledge required)

Mediation level: Personal (nonmediated) vs. quasi-personal (partly mediated) vs. nonpersonal (completely mediated)

Carrying capacity: Unlimited (such as a website) vs. high (e-publications) vs. moderate (email) vs. low (text message)

Media richness: Rich (provides many contextual cues about a message’s meaning) vs. lean (few contextual cues, such as a simple data report)

Social presence: Human source present vs. implied vs. not evident

Technological sophistication: Simple (low-tech) vs. complex (high-tech)

Ownership: By a third party (e.g., mass media or social networking sites) vs. message sponsor vs. none

Message control/selection: By third parties/producers vs. by audience/receiver vs. by sponsor/organizer vs. some combination of these

Segmentation/customization of message content for audiences: High vs. limited vs. none

Personalization/choice of display and content options by users: High vs. limited vs. none

Reach: Large audience vs. small audience

Cost per impression: Expensive vs. inexpensive

Best uses: Build mere awareness vs. engagement/interest-building vs. prompting/facilitating action

Although polar extremes are indicated, many of these criteria represent a continuum of options.

To achieve desired outcomes, communication technologies should be deployed strategically and in combination. Importantly, no single communication technology or medium is necessarily the best choice to reach a particular audience segment. Similarly, technologies must be compatible with the content to be communicated.

Various models grounded in technology have been suggested to categorize the tools used in public relations. For example, Laurie J. Wilson and Joseph Ogden (2008) outlined a three-part cluster model based on technology, specifically

the degree to which tools are interactive and personalized. Other models are less technologically based, including practitioner Don Bartholomew's (2010) increasingly popular PESO model, which suggested media exposure can use tools that are *paid, earned, shared, or owned*. Kirk Hallahan's (2004) model of five major public relations media groups identifies three categories where content is delivered through traditional and new communications technologies (*public media, controlled media and interactive media*) plus two other groups (*events and one-on-one communication*) where technologies can facilitate communication. In Table 2, the

Table 2 Integrated Public Relations Media Model

←Mass Communication High-Tech, Perceptually Based, Low Social Presence, Asynchronous			Personalized Communication → Low-Tech, Experientially Based, High Social Presence, Synchronous	
Public Media	Controlled Media	Interactive Media	Events	One-on-One
<i>Key uses in a communication program</i>				
Build awareness; enhance credibility	Promotion; provide detailed information	Respond to queries; exchange information; engage users	Motivate participants; reinforce existing beliefs, attitudes	Obtain commitments; negotiation, resolution of problems
<i>Principal examples of media</i>				
Publicity/advertising/advertorials/product placements in <ul style="list-style-type: none"> • Newspapers • Magazines • Radio • Television 	Brochures Newsletters Sponsored magazines Annual reports Books Direct mail	Email, instant, text, and microblog messages E-newsletters, e-zines Automated telephone call systems Websites, blogs	Meetings/conferences Speeches/presentations Government or judicial testimony Trade shows, exhibitions	Personal visits/lobbying Correspondence Telephone calls/text messages
Paid advertising in <ul style="list-style-type: none"> • Transit media • Out-of-home media (billboards, posters, electronic displays) • Directories • Venue signage • Movie theater trailers, advertising 	Exhibits and displays Point-of-purchase support DVDs/video brochures Statement inserts Other collateral or printed ephemera Advertising specialties	Vodcasts/podcasts Games Web conferences, webinars, webcasts Information kiosks Intranets and extranets Social networking sites Forums (chats, groups) Media sharing sites Paid text/display advertising	Demonstrations/rallies Sponsored events Observances/anniversaries Contests/sweepstakes Recognition award programs (often supported with multimedia presentations)	

media listed in the left columns rely on traditional mass communication and high levels of technology, while media in the right columns primarily depend on interpersonal communication and comparatively low levels of technological sophistication.

COMMUNITARIANISM

Chiara Valentini, Dean Kruckeberg, and Kenneth Starck (2012) argued that 20th-century public relations theories failed to peel back essential layers of inquiry. Questions about society itself were rarely explored, with little critical examination of predominant forms of democracy and capitalism.

Also neglected, they reasoned, was a corollary criticism of the concepts on which public relations paradigms were built.

Such neglect has certainly been true of “communitarianism,” an underappreciated and often misunderstood concept, ideology, and body of literature that offers considerable heuristic value to 21st-century public relations scholarship and practice. Picking up that theme, Jacquie L’Etang (2008) argued that communitarianism has significance for several areas of public relations, notably “internal PR, organizational culture and corporate social responsibility” (p. 255). Hugh M. Culbertson and Ni Chen (1997) and Roy V. Leeper (2005) have emphasized the importance of communitarianism as a foundation for two-way symmetry, that is, James E. Grunig and Todd Hunt’s (1984) well-established and widely accepted normative model of public relations. Leeper added that communitarianism has implications for the way in which publics are defined, in the concept of stewardship, in the role of public relations in nonprofit organizations, and in communitarianism’s perspective on public relations ethics.

The concept, ideology, and literature of communitarianism has a long and complex history and remains somewhat amorphous. Communitarianism, of course, is predicated on and begs definition and description of “community.” The preeminent communitarian Amitai Etzioni (1995) said “community” is a shared set of social bonds or a social web that is distinct from one-to-one bonds. These social bonds are morally neutral but nevertheless possess a set of shared moral and social values. Etzioni argued that true communal values cannot be imposed by an outside group or by an internal elite or minority but, rather, they must be generated by community members through dialogue. However, such communal values must not be in tension with overarching core values. Etzioni further maintained that “new communities” are part of a pluralistic web of communities and that people today are members of several communities. Noting that several critics argue that the concept of community has no identifiable designation, Etzioni (2000) used this definition:

Community is a combination of two elements: a) A web of affect-laden relationships among a group of individuals, relationships that often crisscross and reinforce one another (rather than

merely one-on-one or chainlike individual relationships); and b) A measure of commitment to a set of shared values, norms, and meanings, and a shared history and identity—in short, to a particular culture. (pp. 222–223)

The concept of communitarianism is most often framed in its opposition and antithesis to classical liberalism. As a philosophical tradition, communitarianism emerged from the Greek philosopher Aristotle, but in its modern interpretations, communitarianism has been theorized as a critique of individualism. Avital Simhony (2001) observed,

One major way of capturing the liberal–communitarian debate is in terms of Sandel’s dichotomous classification of “politics of rights” as opposed to “politics of the common good.” Liberal politics of rights is premised on the Kantian claim that the right is prior to the good. Communitarians question that claim and ground the politics of the common good in a conception of the good life while claiming Hegel and Aristotle as their intellectual resources. According to this classification liberals fail to (and indeed cannot) recognize a genuine shared common good. (p. 69)

Leeper (2005) identified the three most common beliefs that communitarian theorists hold: “First, the liberal position that the state should be neutral in regard to ends is harmful to the development of community. Second, state neutrality with regard to ends is itself a value choice that is not neutral. Third, liberalism sees human rights as transcendent and universal rather than historically contingent” (p. 168). In response to John Rawls’s book, *A Theory of Justice* (1971), critics of liberalism expressed fear for the devaluation of the role of the community in society. Robert B. Thigpen and Lyle A. Downing (1987) emphasized that the main point of contention between liberal and communitarian perspectives is deontological liberalism, with its commitment to human rights and individualism rather than moral liberalism, which communitarians recognize as being necessary to avoid autocracy. Thigpen and Downing (1987) observed that communitarian critics of liberalism are unwilling to abandon the achievements of liberalism in protecting persons from authoritarianism; however, communitarians argue that “moral authority should be

lodged in shared understandings and institutions, not in individual choices” (p. 638).

The contemporary communitarian movement began in 1990, when 15 ethicists, social philosophers, and social scientists met at the invitation of Etzioni and his colleague, William Galston. They explored matters that they believed were negatively affecting contemporary society, including the polarization of debate and the “sound bite” public life that were the results of “teledemocracy.” These scholars were troubled by the pressures that were being placed on people to be labeled in either-or/oppositional terms as well as the tendency of Americans to accept entitlement without a corresponding responsibility. They observed that American civic culture encouraged a strong sense of entitlement but did not encourage a sense of obligation to the local and national communities. They concluded that free individuals require a community that defends them from the state, sustaining their morality through the support of relatives, friends, neighbors, and other community members rather than through government control or fear of authorities. Etzioni (1993) noted,

We adopted the name Communitarian to emphasize that the time had come to attend to our responsibilities to the conditions and elements we all share, to the community.

As Communitarians we also recognized a need for a new social, philosophical, and political map. The designation of political camps as liberals or conservatives, as left or right, often no longer serves. (p. 15)

Thus, the communitarian movement became an environmental movement dedicated to the betterment of the moral, social, and political environment by working with fellow citizens to bring about changes in values, habits, and public policies—allowing communitarians to do for society what the environmental movement was seeking for nature, that is, to safeguard and to enhance the future.

Michael Freeden (2001) said the liberal–communitarian debate of the 1980s and early 1990s has left a residue that is difficult to expunge. However, Sor-hoon Tan (2003) said that those who insist that the two perspectives are incompatible have a narrow—oftentimes unreasonable—interpretation of the opposing side’s perspective,

noting that both liberalism and communitarianism include a wide variety of theories. Tan observed that increasing numbers of both liberals and communitarians are seeking a convergence of what is best in each, that is, the best balance rather than a victory of one perspective over the other.

Communitarianism began receiving some attention in the public relations literature in the late 1980s. Kirk Hallahan (2005) said Kruckeberg and Starck's book, *Public Relations and Community: A Reconstructed Theory* (1988), was the first to argue that public relations should be practiced as an active attempt to restore and maintain a sense of community. Leeper noted that the thesis of the Kruckeberg and Starck book argued that community-building should be the foundation for the theory and practice of public relations, for which perspective coincided with the genesis of the modern communitarian movement that was advocating a proper balance between the individual and the community.

More recently, Kruckeberg and Starck (2004), Starck and Kruckeberg (2000), and Kruckeberg and Katerina Tsetsura (2008) built on what they called community-building theory—arguing that society is an organization's most important stakeholder and that public relations practitioners have inherent responsibilities, not only to their imminent and obvious organizational stakeholders but also to society-at-large, the latter of which is an organization's primary stakeholder. This community-building theory was further developed by Kruckeberg (2007); Kruckeberg and Marina Vujnovic (2005, 2007, 2010); Vujnovic and Kruckeberg (2005, 2010, 2011, 2012); and Kruckeberg, Starck, and Vujnovic (2006) into what these authors call an organic theory. This model of public relations does not place the practitioner's organization at the hub of its universe, which is when an organization is primarily concerned about its relationships with its stakeholders; rather, the organization is only one component of a three-dimensional model of a community in which the organization is equally concerned about stakeholders' relationships with one another. However, despite the shared premises, similarities, and compatibility that these authors' community-building theory and the organic theory have with communitarianism, they have not explicitly used the term *communitarianism* in their work, nor have they

identified themselves to be full-fledged communitarians. Rather, their theoretical perspective borrows primarily from the Chicago School of Social Thought (e.g., Dewey, 1927).

Hanno Hardt (1979) said the study of mass communication must begin with a theory of society. He argued,

... questions of freedom and control of expression, of private and public spheres of communication, and of a democratic system of mass communication must be raised as a part of an attempt to define the positions of individuals in contemporary industrialized Western societies. (p. 35)

This same foundation is requisite for public relations, its scholarship, and its practice. Communitarianism provides a rich literature that can contribute greatly to the public relations scholarship and practice as it continues to evolve in the 21st century.

COMMUNITAS/CORPORATAS

Communitas and corporatas are opposite ends of a spectrum from unstructured public interest to

structure and self-interest. In public relations, the terms represent the opposing tensions of public good versus the measurable benefit to an organization. In public relations research, the terms most often appeared in sports contexts, but they can apply to almost any kind of public relations. They provide a vocabulary for discussing the ongoing attempt to balance public and private, or community and self-interested, goals.

Though the terms appear to be almost synonymous with *community* and *corporate*, their usage is not that simplistic. Because Victor Turner originally defined *communitas* in its opposition to hierarchy and structure, the terms today continue to be used largely as a way of labeling outcomes that are more (*corporatas*) and less (*communitas*) tied to a structure. Based on this distinction, a community organization, such as the Red Cross, can still be very *corporatas* in nature while a corporation that emphasizes employee creativity and involvement, allowing for flexible work hours, can function with a greater emphasis on *communitas*. Specific public relations campaigns generally have goals and assumptions that can be located somewhere on this *communitas/corporatas* spectrum.

Communitas public relations focuses on intangibles such as community involvement and goodwill. Community action committees are an outgrowth of a *communitas* approach to public relations. *Corporatas* public relations, on the other hand, is much more bound by structure and self-interest. Measurable objectives, organizational communication goals, and a bottom-line orientation mark a more *corporatas* style of public relations.

In many ways, *communitas* functions as an ideal type for public relations. It is selfless, it is genuine, and it values, in a broad sense, the idea of public good. Because of this, it is, perhaps, too good to be true. Most organizations' public relations pays homage to *communitas* ideals but cannot exist by promoting solely *communitas* ends; on the flip side, organizations that disavow any interest in engagement or individual freedom in favor of a steely-eyed *corporatas* might struggle to maintain legitimacy. The antistructure and antihierarchy that is *communitas* might be appealing, but it is quite possibly unsustainable, existing only temporarily and subject to forces outside the public relations planning process.

One of the biggest *communitas/corporatas* challenges for public relations is living up to a public's expectations. One reason that sports has been a popular context for the application of these terms is that sports tend to fulfill a community-building function. The economic value of a sports team to its community is debatable; at all levels of sport, however, fans have pride in their teams and enjoy being associated with them, as indicated in many ways—wearing team paraphernalia and even painting faces and bodies in team colors. There is an almost childish devotion to the team; fans feel that by cheering, they become part of the team's success. This perspective creates expectations for significant emphasis on *communitas* in a team's public relations. For this reason, managers, coaches, and players often begin postgame comments by thanking fans and giving them credit for supporting the team to victory. Because sports creates such high *communitas* expectations, *corporatas* behaviors can shatter these idyllic illusions and even cause fans to feel betrayed. If the team can no longer afford to keep the star player, or if it trades established players for prospects, or if a season is interrupted because of contract disputes, the *corporatas* nature of sports-as-business (with structure, balance sheets, and contracts) can create public relations problems for the team, players, and management because it violates fans' expectations for a more *communitas*-oriented enterprise. Any business, obviously, must maintain a degree of *corporatas* if it is to be financially successful, but the emotional importance of sport often relegates *corporatas* to the shadows and highlights a need for public relations emphasizing the *communitas* nature of sport.

Existing within this ongoing tension, then, all public relations (sports or otherwise) is both *communitas* and *corporatas*. Certainly, publics might expect and accept sports teams to have a more *communitas* orientation and multinational corporations to have a more *corporatas* orientation, but the team still has to make money and have structure to survive, while the vague notion of being a "good corporate citizen" still matters to corporations, as evidenced by continued social responsibility initiatives. Skillful public relations means meeting publics' expectations for where an organization should be located on the spectrum between the two endpoints.

Outside of sports public relations, the concepts of *communitas* and *corporatas* remain notable contrasts on the public relations spectrum. True grassroots social and political movements, at least in the beginning, are at the *communitas* end of the spectrum. They are spontaneous, genuine, and relatively disorganized. They also gain passionate adherents quickly. As the movement gains strength and becomes more organized, however, it is likely to create structures and become interested in self-preservation. This automatically guides the organization's motives and public relations more in the direction of *corporatas*. Because the initial impulse was so *communitas* in nature, however, the organization must continue to appeal to *communitas* goals to maintain the commitment of its members. This *communitas* front, however, is unlikely to remain "pure" *communitas* as the *corporatas* needs of the organization enter the foreground. Mature grassroots movements maintain a delicate balance between the two polar extremes. At the other polar extreme from the young grassroots movement is the orchestrated grassroots campaign, an approach sometimes labeled Astroturf lobbying. In this case, agencies work behind the scenes in a very systematic manner to produce the *illusion* of a spontaneous outcry of publics. This highly *corporatas* approach, wearing a *communitas* disguise, highlights the conflicting desires of public relations to pursue *communitas* ends but demonstrate *corporatas* results. So, the public relations associated with social movements is subject to the balancing act of *communitas/corporatas* as well.

COMMUNITY AND COMMUNITY BUILDING

Community and community building represent an alternative framework to the notion of *public* for conceptualizing public relations activities.

For most of the 20th century, the idea of public served as the central concept in public relations theory and practice. The term *public* is used today in varying ways to describe the entire citizenry of a country (the general public) as well people affected by an organization or in a position to affect it (stakeholders). Alternatively, a public is defined as prospective recipients of public relations messages (audiences) or as groups that organize to resolve a situation they define as problematic (activists).

By contrast, a community can be conceptualized as a group of people who share a common experience, identity, or interest and who are joined together through their interaction or communication. Importantly, *communis* (to commune) is the root word for both community and communication. Community, as a concept, has deep historical roots in many cultures but has received increased scholarly interest since the 1980s as a way to describe groups of various sorts. The popularity of the term is evident in everyday references to such ideas as the business community, the educational community, and the minority community.

Geographic Versus Symbolic Communities

Traditional use of the term *community* denotes a locality. A geographic community is a particular region, city, or neighborhood. Many organizations engage in community relations programs to reach out to people in geographic proximity to their operations to foster mutually beneficial relationships.

Yet, communities are not bound by geography anymore. Today, they can be plotted along a

continuum from purely geographic to purely symbolic in nature. In a symbolic community, people are tied together because they interact with one another and share common beliefs, values, and cultural artifacts of life—language, traditions, customs, mores, and so on. Whereas proximity and geographic boundaries once delineated communities, the rise of new communications technologies has redefined communities so they can operate on a global basis.

The rise of industrial life was described by early sociologist Fernand Tönnies as a transformation of human life from *gemeinschaft* or community (a small agrarian village where people all knew one another) to *gesellschaft* or society (where people live interdependently among strangers with whom they have few or only specialized relationships). Early sociologists lamented *anomie*, or an emerging sense of isolation and loss of identity among people, as a deleterious effect of modern life. Later researchers, however, recognized that people engage in various activities that help develop a sense of community and overcome alienation. Sociologists from the University of Chicago (known as the “Chicago school of social thought”), for example, examined how people operated as small communities within the larger urban setting of Chicago.

Collectivism Versus Individualism

People in Western cultures have been described as torn between a desire for freedom (being independent and self-reliant) and a desire to belong (and thus become a part of a larger collectivity). The premium placed on freedom in Western cultures is evident in the American and French revolutions as well as in the early-19th-century American literature that focused on the virtues of transcendental individualism. This rise of intellectual interest in individualism paralleled the growth of capital markets, the polis (nation-state), the nuclear family, and the early beginnings of mass society.

The second half of the 1800s, however, saw an increased awareness in the importance of communal life. This was evident in intellectual thought related to politics, morality, nature and genetics, and the nature of intellectual inquiry itself. Importantly, collectivism as a value orientation or cultural dimension never lost its importance in Eastern cultures, where collective decision making

and self-identity as a member of a larger collectivity are stronger than in Western cultures.

Communities Versus Publics

For organizations concerned about building and maintaining mutually beneficial relations with important constituencies, the difference between publics and communities is an important one.

Communities define themselves and thus exist outside the context of any particular organization. One of the benefits of using community as a framework for public relations work, therefore, is avoidance of various conceptual problems that plague the public construct. Communities are not merely audiences and are not defined by their stakeholder relationship to the organization. Communities are the umbrella grouping within which various publics might exist and from which groups of people might form to address issues.

Communities differ from publics because they organize around common interests, not issues, and are apolitical. Their goal is usually to sustain the group rather than to effect change. In this way, communities are proactive, not reactive. Communities have long and well-established histories and people within them routinely interact by sharing a common culture. By contrast, a public created around an issue often has a short-term life span and brings together diverse people whose only commonality is concern about a common problem.

As the term is commonly used, a public is considered to be made up of individuals, yet communities can be thought of as being composed of individuals as well as organizations and institutions. Communities are often easier to locate and to identify, compared to an issues-driven public that must first make its presence known. Importantly, a single-purpose public can evolve into a community, but the group’s focus usually broadens beyond the single issue around which it might have been formed.

Community-Based Theory in Public Relations

Several public relations theorists have called for focusing on community and community building in public relations practice.

Dean Kruckeberg and Kenneth Starck (1988) were the first to argue that public relations should

be practiced as an active attempt to restore and maintain a sense of community. Such an approach places a premium on caring about and for others to create a more human and mutually supportive society. The authors challenged public relations to (1) make community members conscious of their common interests, (2) overcome alienation, (3) use technology to create community, (4) promote leisure-time activities, (5) engage in consummatory (self-fulfilling) communication that can be enjoyed for its own sake, (6) lead in charitable works, (7) help communities share aesthetic experiences, religious ideas, personal values, and sentiments, and (8) foster personal relationships.

L. J. Wilson (1996) similarly argued that creating strategic communities is a means for corporations to foster positive relationships. The following five characteristics are required by corporations: (1) long-range vision, (2) a sincere commitment to community service, not just profit, (3) organizational values that emphasize the importance of people (including trust, respect, and human dignity), (4) cooperative problem solving and empowerment, and (5) a relationship-building approach to public relations.

Other researchers have pointed to the communitarian movement of the 1990s as a potentially ethical framework for public relations. Hugh M. Culbertson and Ni Chen, for example, outlined six major tenets in 1996. These ideas stress the importance of commitment to relationships, interconnectedness and social cohesion, common core values and beliefs, a balancing between rights and responsibilities, empowerment and involvement in joint decision making, and a broadening of perspectives to reduce fragmentation.

Although not using the term *community* per se, various theories related to symmetric communication, symmetric worldviews, two-way communication, and dialogue are all consistent with notions of community. Similarly, the development of communal (versus merely exchange) relationships and community involvement measures has been incorporated into the measure of relationship outcomes in public relations.

Although community can be situated firmly in modern thought, postmodern theorists have especially embraced community as a concept that lends itself to both critical and cultural approaches to the study of public relations. The shift away from

conceptualizing public relations as an organization-centered practice to one in which various social actors engage reflects the importance of power in the community. Similarly, cultural theorists have examined the problems related to universalism versus particularism of public relations practices and how premises of public relations practice must be adapted to particular communities or cultures.

The community construct can be found in numerous aspects of the field, including adoption of new technologies (e.g., the creation of online or virtual communities), risk communication (e.g., community conflict and community advocacy councils), health communication (e.g., community-level interventions and community readiness to change). Other theories in which community plays an important role include public relations field dynamics (community versus self-orientation) and theories of social capital (which measure social cohesion and interaction as a basis for assessing the quality of life).

Three Dimensions of Community Building

Community has been criticized as an abstract, idealized state that can never be achieved. Some would argue that true community can be achieved only where everyone shares an affinity or like-mindedness, where people always like one another, and where consensus is always present. Yet, such an approach to community is improbable in today's pluralistic society.

Others suggest that community exists where people are conscious of others and recognize people's personal needs for expression, growth, and transformation. In such a community of otherness, many points of view are present, but polarization is avoided. Such communities are functional because members support the well-being of the group so that everyone is successful and social order is maintained.

Public relations representatives of organizations can participate in and build communities in three ways:

1. *Community involvement* involves facilitating an organization or cause's participation in an already existing community—the traditional boundary spanning function commonly associated with geographic community relations. Involvement includes socially responsible gestures (such as

attendance at community events) and participation in discussions and dialogues—in order to interact with others as responsible community citizens.

2. *Community nurturing* entails fostering the economic, political, social, and cultural vitality of a community where people and organizations or causes are members—beyond mere involvement. Organizations can be official sponsors of activities, such as a Little League team or a major event. Organizations can also recruit volunteers or engage in philanthropy to help communities. Community-oriented organizations can view their involvement as matters of social responsibility (where no quid pro quo is expected), as relationship building, or as enlightened self-interest in that some reciprocity is expected. True nurturing, however, excludes efforts by organizations that are intended simply to put a positive face on the organization through adroit impression management.

3. *Community organizing* involves the grassroots forging of new communities among disparate individuals or organizations with common interests. Such is the case with the creation of formal or informal groups within organizations as well as efforts to create clubs, associations, and societies outside of an existing organizational context. To the extent that efforts are rooted in social problems, community organizing closely resembles the formation of a social movement. Yet, interests—not issues—define communities.

Public relations practitioners can play varying roles in this community organizing process. In community involvement, public relations professionals are agent representatives of an organization or cause who become active participants in community activities and conversations. In community nurturing, public relations professionals act as program facilitators, orchestrators of events, producers of information, and managers or coordinators of volunteer and philanthropic activities. In community organizing, the roles are as leaders, recruiters, and advocates. The overarching metaphor for all of these roles is *community builder*.

COMMUNITY RELATIONS

Community relations is a public relations function focusing on the management and communication challenges organizations need to meet to be welcomed partners in communities where they want to operate. It features interactive networks and social constructions for the benefit of both organizations and community residents as a dialectic of harm and benefit. As dialogue, this process is grounded in participants’ rights, corporate social responsibility, and the power of community opinion.

Some general conclusions that can be drawn about community relations:

1. It is inherent to an organization’s need to be legitimate, as the right to operate.
2. It sets the foundation for issue contests, crisis response, and risk management.

3. Its complexity requires ongoing, careful, and thorough analysis of relations with various publics.
4. It can be local, regional, national, or global.
5. It is affected by forces in the environment that require ever-changing strategic and interactive approaches.

Historical Development of Community Relations Concept

Community relations developed as a result of dissatisfactions and tensions between organizations and their near publics. Originally, strategic philanthropy in terms of support for the arts, sponsorship of community activities, or jobs was considered to be sufficient to generate goodwill for an organization. Community relations became a matter of serious research as activism brought changes in standards regarding organizational legitimacy.

Historically, in the early stages of 19th-century industrial expansion, businesses were widely viewed as a benefit to a community. New industry provided jobs and supplied the community with an ample tax base. However, as time passed, it became more and more evident that corporations often exacted a toll on each community in terms of layoffs, relocations, pollution, increased health problems, employment safety issues, the attraction of large groups of people, as well as domination of local government.

Initially, activists directed their ire toward specific businesses within a geographical community. As technology and transportation improved, the geographical constraint became less of a central factor. The “voice” of the community became regional, national, and even international. Complaints translated into issues wherever the organization was located.

Groups of critics were being organized with generic names like unions, service groups, and educators to organize and represent certain issues. Those groups became branded by issue: environmentalists (e.g., Greenpeace and Sierra Club), animal rights (e.g., PETA), or senior citizens (e.g., Gray Panthers). Such opposition groups sought to bring organizations into public disfavor, justifying issue debates and seeking constraints over operations as well as attacks on reputation.

These forces resulted in the public relations function of community relations, which was designed to monitor emerging issues, address the acceptability of policies and operations, and assess the strength of relationships between the organization and citizens. Nonprofits and government are faced with similar challenges. The community relations function in public relations is also well established in nonbusiness organizations. It is often central to the survival of the nonprofit organization; for instance, symphonies were no longer merely expected to perform but also to reach out to increase music appreciation in schools.

Consumer Forces

The earliest dissent groups formed were coalitions representing consumers. In the United States, particularly, the organizational power of communities resulted in many consumer laws restricting and regulating business organizations. In response, more organizations dedicated community relations resources to working with consumer activists. The level of sophistication in strategic communication has become quite complex for the organization and publics. A potent activist challenge, for instance, is a local, national, or international boycott.

New Media

Traditionally, protests might be local and personal. Increasingly, even when clashes manifest at business or governmental properties, the criticism and challenge of community relations “goes viral.” This expansion of community discourse via social media helps citizens share grievances and information, especially youth who have become proficient in communicating dissatisfaction. Today, youth protests emerge through tweets, texting, and visual postings about many matters, such as the lack of jobs in Spain, frustration with England’s higher education policies, and concerns about authoritarian rule in what became known as the Arab Spring. Activism can now be more dynamically transparent because digital technology integrates communities in discourse.

Goals for Community Relations

Community relations involves more than appearing positive and offering small benefits to

the community whose goodwill the organization needs. Community relations professionals can help prepare an organization for meeting the challenges in a diverse often unpredictable climate.

Because stakeholders often seek recognition, a hearing, and sincere consideration, the public relations professional must prepare by completing the following series of stages: initiate or reestablish a community relations intent; research internal and external infrastructures, attitudes, requests, and so on; build dialogic bridges; monitor the environment; and integrate the data and actions into a synergistic approach that allows for a mutually beneficial coexistence for organizations and the stakeholders. Both organizations and stakeholders must create trust to support ongoing dialogue. Stakeholders especially need to be integrated into the dialogic process.

Communication: A Metatheoretical Approach to Community Relations

How this evolution of opposition developed to stimulate the need for community relations is attributed by some to the individual who discovers power in joining groups and thus having more of a voice about issues. As advocates of strategic issues management, Robert L. Heath and Michael J. Palenchar (2009) featured the need for dialogue and collaborative decision making. Heath and Lan Ni (2010) reasoned that corporate social responsibility and community relations should link in ways that lead organizational managements to consider whether they are the sorts of neighbors citizens welcome. The type of organization is at minimum *nice*, contributing to community activities, such as sponsoring little league teams and supporting education. The organization is a *good or generous* neighbor if its revenue contributes directly to the community, starting with attractive facilities, good jobs, and other activities that add measurably to the quality of life in the community. The third level of being a welcomed neighbor requires *reflective management*—seeking a synergy whereby the organizational management considers the impact of its operations, its long-term commitment, and the extent to which mutual benefit is a guiding management criterion.

The true test of public relations is if the discipline can sustain an ongoing impact on the major

global challenges facing society today. Public relations is involved in all phases of life, such as biogenic food, AIDS/HIV, building a civil society, association representation, education, and health. The degree to which public relations is consulted and involved in these societal needs depends on the degree of professional preparedness to lead the dialogue on such community matters.

Communication remains the fundamental element in developing community relations from a public relations perspective. However, there have been misdirected efforts to supplant wise management decision making with communication. For example, the liberal versus communitarian debate lacks the stature to qualify as a public relations metatheory for the following reasons:

1. The concepts are primarily posed as a Western world discussion and, therefore, are not as useful for global public relations.
2. The statements presented reflect primarily polarized concepts—liberal versus communitarianism—and, therefore, are either unrealistic or idealized.
3. The discussion is based on a disregard for the understanding of the nature and evolution of communication knowledge.
4. It is impossible to implement or develop as a requirement of societies to conform, even if this applies only to the United States.

As public relations academics attempt to develop the concept of “relationship” as a public relations metatheory they risk failing to develop a sound rationale for community relations. Philip Lesly (1966) noted that this is another attempt to Balkanize the field of public relations into segments. Only through dialogue is ethical communication possible as a basis for relationships. Communication ranges from public communication, including debate, to discussion as rhetorical or persuasive communication, and the emphasis is on dialogue and the co-creation of meaning rather than sharing information.

Through communication, dialogue is established and language constructs the conceptual possibilities of co-created harmony. The dialogic approach carries critical universal structural elements to assure the communication act is truly complete and authentic. This is different from

communication as rules or procedures because it is more of a creative process where engagement and deliberative democracy triumph. In community relations, the fundamental metatheory focuses on the speech act as affected by the self, the episode, the relationship, and culture.

open meetings with the community, one-on-one with influential stakeholders, and other methods. They have many purposes, perhaps the most fundamental of which is to justify the right to operate.

The relationship between an industrial facility and its community is scrutinized, challenged, validated, measured, and ultimately redefined as public expectations evolve. One indication of a socially responsible facility is the extent to which it engages in dialogue with the community. One of these tools, a community report, can be particularly effective when it addresses local issues and concerns and is produced as one component of an overall communications strategy.

Community reports have been around for decades in one form or another, typically published as a subset of a financial, operations, or philanthropic annual report. Today's world of instant electronic communication tools has effectively made the "annual" community report obsolete. Good reports—traditional printed media, or new and emerging media, such as social media—are those that have credibility with their target audiences. A public that has grown comparatively more astute and less accepting over time now requires, and in some cases demands, details about the good, bad, and ugly aspects of facility operations that affect their quality of life. And depending on the historical operations of a facility—including its ability to quickly communicate in response to incidents that directly impact neighbors, such as noise, odor, lights, and emergencies—a comprehensive annual, quarterly, or monthly report may not be sufficient. Recurring or significant problems that disrupt quiet residential life are clear justifications for ongoing communications.

Regardless of the format and frequency of a community report, the starting point is understanding who the relevant stakeholders are and what constitutes meaningful dialogue with them. Only then can a baseline be established and a go-forward strategy implemented that are critical to planning for and measuring the effectiveness of a community report. It is critically important to define the purpose of a community report (informational, educational, image-building, etc.), identify the target audience(s), select a look and feel (printed, electronic, or both), consider when and how often the report is issued/updated, and determine if the goal is one-way or two-way dialogue.

COMMUNITY REPORTS

A community report is a communication tool that is produced and distributed in the format and frequency determined by sound research. Reports can take the form of printed pieces, emails alone or with links to a website, social media applications,

Dialogue with the community means engaging stakeholders and listening to what they tell facility representatives. Done well, good dialogue sets the stage for mutual understanding and respect, clear and open lines of communication, opportunities to identify common ground, and other benefits. One limitation to dialogue is the inability to reach everyone who feels they have an interest in facility operations. Some people or communities farther away from the facility, or special communities of interest within the facility's operational area, may feel excluded. A community report mailed to homes and businesses by zip code is a way of reaching stakeholders beyond traditional community boundaries.

A *stakeholder* is anyone who has an interest in or can influence a business or facility. Stakeholder cooperation or involvement is needed for the facility to obtain and maintain its "license to operate." Stakeholders may be shareholders, employees, customers, suppliers, contractors, families of workers, business partners, people whose livelihoods are dependent on the facility, and people who live and work near the facility—the community—which includes local media, elected officials, activists, civic leaders, schools, and residential and industrial neighbors. It is this community stakeholder group, along with employees and retirees, who are the primary audiences for a community report. These stakeholders are at the front line of a facility's efforts to develop and sustain community goodwill and trust needed for reputation management. In good times, this bank of reputation receives deposits through good operational performance and relationship building; on the other hand, reputation hits or withdrawals occur when facility performance negatively affects the community, such as during an accident that requires public action or, at the very least, when operations are more noticeable than usual to nearby residents. Public perception of indifference to a problem caused by a facility, particularly through inadequate communication, can drain the reputation account and test community expectations regarding facility social performance.

Social performance includes all the ways a facility's activities affect society. At a local level it includes employment, contracting, operations, community involvement, security, social investments, and health, safety, and environmental issues. It also reflects the local priorities and issues of

significance as identified through stakeholder engagement. Nationally it might include the impact on U.S. economic and social development; globally it may include the impact and contribution of the company's products and activities.

Such efforts fit under the aspect of the discipline called *community relations*, active alignment of interests between a facility and the local community. Community relations may mean no more than "getting to know your neighbors," talking with them, and inviting them to visit. It might involve good site management—ensuring that neighbors are satisfied that when issues occur, their concerns are handled promptly and professionally. Two valuable benefits of good community relations are goodwill and trust, which are almost always achieved through sincere effort, action, and alliance with community residents. Not to be overlooked are the employees, including retirees, who can be among the best community ambassadors.

A tailored approach is best for determining the content and appearance of a community report. In some cases a letter from the facility manager to the community outlining business and operational performance may be adequate. At the opposite and more expensive end of the spectrum, an elaborate full-color brochure or website with graphs, photos, and text covering such issues as health, safety, environmental impacts, taxes, economic and other issues of local significance, employee volunteerism, and philanthropic endeavors—emphasizing with examples the facility's commitment to be a good neighbor—may be the way to go. Again, producing an effective and well-received report can be leveraged by up-front analyses of community relations, social performance, stakeholder identification, and dialogue as they pertain to the facility-community relationship. A disconnect occurs when a facility's messages do not meet the community's expectations, are regarded as insincere or self-serving, or simply are written at a level that is inappropriate for the readers (the communication relies on corporate/industry jargon and acronyms, misses the mark on topics addressed, etc.).

Health, Safety, and Environment

Among the most important types of community reports are those related to health, safety, and environment (HSE). Environmental and community

activists raise doubts about companies' willingness and ability to reduce their impact on citizens' health and safety as well as environmental quality. In response, concerned companies set goals and improve their environmental performance. A second response is to communicate their corrective actions and the results of those actions to the communities where they operate.

HSE reports can be stand-alone or be part of a broader community report. They tell of the progress being made to change processes and procedures to reduce a facility's potential impact on people's health and safety as well as to protect the environment. Health details relate to changes that might include discontinuing the use or emission of products associated with long-term consequences for people's health. Exposure to some chemicals in sufficient quantity, for instance, might cause respiratory problems or increase the incidence of cancer among community residents. Safety issues relate to sudden occurrences that might harm or kill area residents, such as explosions. Environmental impact statements might include reductions in emissions that change the color of the sky or produce unpleasant odors.

In recent years, under pressures from peers, government, and activists, companies have begun to state their mission, goals, and objectives relevant to HSE performance. For instance, they might report that specific processes are being implemented over a five-year period to reduce the discharge of harmful chemicals into water in the community. Each year they might then indicate how the changes are progressing and how discharges are being reduced to acceptable levels. In some cases, a company will publicly commit to reduce emissions beyond the levels specified in permits issued by regulatory agencies or voluntarily relinquish the "grandfather" status of particular process units that, due to their age, are exempt from current emission standards.

Industries, such as refining, chemical manufacturing, and electrical generation, use trade associations to get members to set and achieve higher standards of HSE performance. They conduct, commission, and respond to research in an effort to understand the technical aspects of each issue. Realizing a bad apple spoils the barrel, they share best practices that can improve the performance and therefore enhance the reputation of the industry. For the chemical manufacturing industry,

industry-wide recommendations made by the Responsible Care Program were initiated through its trade association.

HSE reports often feature specific measures being taken by individual companies. They might, for instance, tell of increased maintenance routines or manufacturing procedures that have been undertaken to achieve positive HSE results, or they may report the installation of new equipment or improved processes to enhance performance.

Some HSE reports are highly technical and specifically tied to best business practices. Others tend to feature image more than substance. They might indicate that a company is committed to a clean, safe, and healthy environment. They even include pretty pictures of birds, sunsets, and equipment, but those reports might not indicate in a fully technical and operational way what constructive changes are being implemented. Early in the modern era of increased openness by industry, graphs illustrating downward trends of emissions were common, because they demonstrated progress over time. Companies were able to take credit for reducing emissions without always focusing on whether the current levels were still too high. As the public grew accustomed to the trend graphs, harder questions were asked, along the lines of "We see you are reducing emissions of certain chemicals; what we want to know is if the level today poses any health risks to us."

The incentive for such reports started in the 1980s when several major operating plant failures alarmed community residents and citizens around the world. Such concern sparked legislation in the United States called Community Right-to-Know. People have a right to know what is occurring in their community that could affect their health or safety. Federal legislation and regulation sparked changes in operations, including communication between companies and area residents.

So that local residents could be informed, state and federal regulatory bodies required companies to indicate what amounts of specific chemicals were being released into the atmosphere. The federal Environmental Protection Agency (EPA) was one of the organizations spearheading this trend. Data collected by operating plant experts are reported to the EPA and to various state agencies.

Company versions of HSE reports were typically published documents, either pamphlets or booklets.

Often, many more copies of such documents were printed than needed. One solution was to include HSE reports on the company website. This makes the information available to any concerned citizen who wants to better understand a neighboring company's HSE plan and progress reports.

Data tell only part of the story. HSE reports give companies the opportunity to put those data in perspective and to show how changes are being made to improve the HSE conditions of the community. Such reports become part of the community dialogue and planning process when citizen input is obtained. Concerns are voiced and heard. Organizations use sound science and responsible operating procedures to make and report changes and improvements. These efforts become a vital part of these companies' endeavors to demonstrate their concern for citizens of the communities where they operate. They want to be seen as beneficial rather than harmful neighbors. They work to build goodwill.

Reports Add Value to Communications

Consideration must be given to the relationship between the facility and the community—"hot" issues that need attention—logistics, demographics, staff required to do the work, costs, and other factors. Also, recognition must be given to the possible barriers of each interim approach; for example, everyone on the stakeholder list may not have an email address. Whether a stand-alone report is planned or a more comprehensive approach with several elements, it is better to start slow and build momentum than to launch an aggressive communications program and curtail it later due to resource limitations.

The value of a community report is enhanced when stakeholders have an opportunity to provide feedback on the content, style, and frequency of the report. A postage-paid tear-out postcard is an easy way for readers to rate the effectiveness of the printed community report. Keep it simple, with boxes to check and a space for general comments and suggestions. Formal readership surveys also can be productive, as can focus groups and informal conversations with stakeholders. Options for feedback include printed (mailed or faxed), electronic (email or responses to a website), and in-person venues.

Community reports can stimulate dialogue between a facility and its community. Basic or slick in format, mailed to homes or available electronically, if the result is open communication about issues and concerns of mutual interest, and used in conjunction with other regular communications that incorporate the principles of stakeholder engagement and dialogue, a community report is a worthwhile outreach tool.

COMPOSING/COMPOSITION

Composition is the process of composing (creating and arranging) type for printing, that is, the letters, numerals, punctuation marks, and other symbols that are used to create written text that appears in a printed publication. Today, it includes text created on computer software and as it appears on the Internet and its World Wide Web. Type was assembled by hand for about 400 years after Johannes Gutenberg invented a printing press in about 1440 that used movable type to print ink on paper. While some 19th-century inventions preceded the typesetting machine that Ottmar Mergenthaler invented in 1886, his Linotype was the first that was suitable for commercial use.

Other metal-casting typesetting machines soon followed that also created raised (i.e., relief) metal “hot type” that was needed for letterpress printing, for example, the Intertype and the Ludlow, both of which also cast one-piece fully spaced lines; and the Monotype, which cast individual type characters in justified lines. While such innovations were a remarkable improvement over the tedious hand composition of individual type characters, the type compositors who used these typesetting machines were nevertheless laboriously slow compared to today’s typesetters who simply use a computer keyboard to set type for offset lithography (planographic) printing—at the normal speed of creating any other type of document on a computer. Indeed, anyone today who does desktop publishing could be considered a type compositor, albeit one lacking in the skills the craft required in past generations of printing technology.

As opposed to the creation of cast-metal hot type, a cold-type process evolved in the mid-20th century that ranged from “strike-on” machines that were similar to electric typewriters of that era, which evolved into the far more sophisticated photocomposition machines that produced type on film and transferred this type directly onto a printing plate. Such cold-type could be used in offset lithography (planographic) printing, which newspapers began using as early as the late 1930s but which became common among even the largest-circulation dailies in the late 1960s and 1970s. Nevertheless, for their own job-printing needs, public relations practitioners still bought typesetting from those offering photocomposition services (oftentimes the same companies that would do the printing) until the past quarter century or so, when direct computer links to printers made this specific skill obsolete.

To fully appreciate the evolution of type composition and the skills of the type compositors of an earlier era, the practitioner must study the whole process of printing, which is changing rapidly today—more so than it has in the 5½ centuries since Gutenberg’s press began using hand-assembled movable type. Just as was the case with their long-dead predecessors who could rapidly assemble hand-set type, those type compositors who composed type using the Linotype and similar machines of an earlier era—with their large keyboards or other mechanical type selection methods

that differed greatly from today’s computer keyboards—are a disappearing breed. The few remaining Linotype compositors might only operate such machines at a history pavilion for the entertainment of those attending a state fair, in remote areas of lesser-developed countries, among religious sects that eschew today’s technology. Nevertheless, the mystique of this highly skilled craft of the type compositor will never be known by those who today compose type for printing on their computer keyboards.

CONFLICT RESOLUTION

Conflicts among stakeholders and organizations require attention and the problem-solving capabilities of public relations managers. Public relations scholars have suggested that these managers often help an organization manage its response to conflict and to rapid environmental changes. Researchers have brought together conflict and public relations—for instance, in 1997 Yi-Hui Huang wrote on relationships, in 1995 and 2001 Kenneth D. Plowman covered power, and then in 2005 Plowman connected strategic management with conflict and public relations.

Two-Way Models of Public Relations

Conflict resolution in public relations evolved from the four models of public relations. The most sophisticated of the four models are the two-way asymmetrical and the two-way symmetrical models. As these two models of public relations evolved, James E. Grunig (1989) described the two-way symmetrical model as “public relations efforts which are based on research and evaluation and that use communication to manage conflict and to improve understanding with strategic

publics” (p. 17). In 1995, the new model of symmetry as two-way practices was developed where the win-win zone uses negotiation and compromise to allow organizations to find common ground among their separate and sometimes conflicting self-interests. By doing so, it did not exclude the use of asymmetrical means to achieve symmetrical ends, according to David Dozier, Larissa Grunig, and James Grunig.

Mixed Motives

Although the two-way symmetrical model would seem to be the ideal for conflict management, it is difficult to determine the exact point for appropriate behavior on a continuous scale between two-way asymmetric and two-way symmetric communication. Priscilla Murphy (1991) suggested that a mixed motive version of the two-way symmetrical model might better describe what is happening in the actual practice of public relations because it incorporates both asymmetrical and symmetrical strategies. More recent studies acknowledge the more frequently practiced model is the one termed *mixed motives*.

In mixed motives, each side in a stakeholder relationship retains a strong sense of its own interests, yet each is motivated to cooperate to attain at least some resolution of the conflict. They may be on opposite sides of an issue, but it is in their best interests to collaborate. Mixed motive games provide a broad third category that describes behavior as most public relations people experience it: a multidirectional scale of competition and cooperation in which organizational needs must be balanced against constituents’ needs. These cooperative protagonists struggle to satisfy their own interests with the knowledge that satisfaction is best accomplished through satisfying each other’s interests.

Mixed Motive Model of Public Relations

In 2000, Kenneth D. Plowman, William G. Briggs, and Yi-Hui Huang established a number of negotiation strategies that fit into what Plowman called a mixed motive model for public relations that encompassed the entire spectrum between the two-way asymmetrical and the two-way symmetrical models. It now includes the strategies of contention, avoidance, accommodation, compromise,

cooperation, unconditionally constructive and win-win or no deal, principled, and mediated or cultural. In 2007, Plowman added a tenth strategy, perseverance.

Contingency Model of Conflict

Since 1997, Glen Cameron and his colleagues (see Cancel, Cameron, Sallot, & Mitrook, 1997) have been developing a continuum ranging from pure advocacy to pure accommodation as the basis for a contingency model of organization–public relationships. Accommodation is not viewed in the classic sense as giving in to the other party. Rather, it is “the degree of willingness to entertain change for the benefit of others” (Shin, Jin, Cheng, & Cameron, 2003, p. 9). Research by Shin and colleagues regarding conflicts played out in the media have shown that an organization uses the advocate strategy more when its key stakeholder advocates in an escalating spiral, indicating the media may be a separate power-brokering party. As the field of conflict resolution and public relations becomes more developed, the more complex are strategies, factors, and tactics. This is evidenced by the 86 factors featured by contingency theorists.

In 2010, Cindy T. Christen and Steven Lovaas developed what they called a dual-continuum approach to conflict management in public relations, extending the work of Cameron and his associates. As explained by Plowman in 2007, this dual approach essentially is similar to mixed motives and looks at the advocacy or contention, and accommodation or cooperation to examine these strategies in a non-linear fashion. Christen and Lovaas, as well as Plowman in 1996 and Thomas in 1992, maintained that real-world disputes are far more complex than a single continuum can represent and that in a cooperative or a collaborative, win-win situation where contention and cooperation overlap, there cannot be a single continuum.

Multiple Party Negotiations

Complexity is a major factor in multiparty negotiations that may be the next step in this type of public relations research. In 2008, Plowman undertook a qualitative quasi-experimental design with 11 graduate students taking on different roles in the

hot waste issue in Utah. These students framed the issue, defined their self-interests as stakeholders, and then conducted a series of five role plays on the issue. All nine strategies were paired against each other in different combinations. Findings revealed that contention was the most used strategy but was most often combined with the principled strategy. If those strategies were not successful, then role players turned to avoidance. During the third round, role players started using cooperation and compromise. Using these two strategies created a less confrontational atmosphere and the role players were more inclined to discuss alternatives. The most useful strategy, however, was mediation in resolving the hot waste issue.

Most research in conflict resolution has involved just two-party disputes, but in practicality and especially for public relations, there is more than one stakeholder present. In 1996, Lawrence Susskind and Patrick Field described public relations using terms that essentially equate to one-way and asymmetrical models, then use a version of Roger Fisher and William Ury's mutual gains approach to resolve public disputes in a symmetrical manner. This research in the field of conflict resolution demonstrates that more work needs to be done in multiparty disputes.

A multiparty dispute can be defined as a simultaneous negotiation among three or more parties over multiple issues. The larger the number of participants in these multiple party conflicts, the more difficulty there is in defining the problem and agreeing on an acceptable solution. There is more likelihood of complexity in conflicting positions, the underlying self-interests, and the relationships—as in public relationships among the various parties involved. Mediation seems to be a common strategic direction for the field. In multiparty settings, mediators are usually a part of the negotiation. Their intervention does not alter the structure of the negotiation and is not difficult to accept by the parties involved. Such mediators can come from outside the dispute or there can be several, some acting from their roles inside the dispute.

Mediation, Public Relations, and the Media

In the conflict resolution literature, scholars are beginning to see the advantages of this peer mediation (public relations practitioners or the media),

mediation done by peers in an organization who have a vested interest in that organization. Typically, comediators (meaning two) separately meet with the parties involved within an organization to investigate issues and to find possible solutions to raise in a joint session. In Kenneth Cloke and Joan Goldsmith's view, there is no reason that public relations or the media cannot take on that peer mediation role with stakeholders both in and outside the organization. The stakeholders know the advocacy position of the public relations manager from the initiation of the mediation. The advantages of peer-based mediation are "numerous and well-documented" (2000, p. 31).

Third parties who are seen as having greater insight into the various stakeholders' interests, such as public relations managers and the media, may be seen as more credible and better able to craft recommendations that suit those interests. In 2012, Kenneth Plowman, Susan B. Walton, and Alex Curry conducted a case study involving the media and public relations in a public policy dispute over the building of a professional soccer stadium. In 2003, Shin et al. found that the media only served as a separate power-brokering party and to assure that more information was provided to key stakeholders. It was found that the media, playing a watchdog role of government, were more successful at providing information to all the stakeholders involved rather than helping resolve the dispute in question.

Implications at the International Level

Culture is a powerful force shaping thoughts, perceptions, behavior, and communication. By its very complexity, culture initiates the negotiation tactics of contention or principled negotiation in many instances. The ability to successfully navigate and negotiate across cultures is the key to successful public relations practice globally. Cultural diversity makes communication more difficult. Because knowledge is culture-specific, the more a communicator understands cross-cultural differences, the easier the communication task becomes. Paradoxically, if negotiators can overcome communication barriers, mutually beneficial solutions—the cooperative tactic and win-win solutions—may become easier. Differences, rather than similarities, can form the basis of mutually beneficial solutions. In

a multicultural environment, differences are increased; thus, the opportunities for mutual gain are also increased, according to Huang in 1997.

Directions for Research

Future research has many problems to solve and questions to answer. Public relations and the media's involvement in a conflict should be further explored. What about comparing community negotiation (meaning negotiation with special-interest and citizen groups) in the conflict resolution literature with the activist and segmentation of publics' literature in public relations? Such negotiation implicitly includes multiparty negotiations. It overlaps into the trend in journalism of public or civic journalism, where reporters have a responsibility to help the public understand the context of the news or conflict. This is very similar to the goal of media relations within public relations, to provide information to the media to ensure balanced coverage. What about the role of the public relations manager in such a public dispute? Is he or she an advocate, a mediator, a third party, or an ombudsman? As consideration addresses the concept of relationships among stakeholders in a conflict, it may address how relationships are perceived, differently or alike between the two fields.

CONSTITUTIVE THEORY OF LANGUAGE

Constitutive theory of language is an interpretive theory, grounded in hermeneutics, that postulates that language, a fundamental instrument of knowledge, and only language, makes the revelation of the human world possible. The hermeneutic tradition positions meaning at the center of human understanding and cognition. Human beings are language animals; they articulate their existence through language. At the same time, it is through this articulation that humans can change their norms and purpose. Thus, language allows new purposes and new meanings, and without language, the world as we know it and our understanding of it would not exist. The importance of language and meaning has always been at the center of public relations scholarship (Heath, Toth, & Waymer, 2009). Constitutive theory of language can provide a solid point of departure for studying socially constructed meanings and interactions among various groups of stakeholders.

Constitutive theory is the antitype of framing theory, which paints a picture of language within the framework of human life. In contrast, constitutive theory makes it possible to have new understanding and new behaviors as purposes and mental functions cannot be defined, understood, or evaluated without reference to language. Constitutive theory provides a full range of expressive, or symbolic, forms, in which a symbol is a constitutive expression. The constitutive approach postulates that the world does not simply affect human beings by providing a certain state of affairs, to which humans should react, or by creating a chemical condition, through which we produce joy or sadness, for instance. The meanings of *sadness* or *joy* only exist as the world imposes on the human mind. Thus the meaning is endogenous. So understanding and communication are only possible because speaking develops an interpretive position in which the nature of things is revealed, not because words are used as referents.

Charles Taylor, a famous Canadian philosopher and a recipient of the prestigious Kyoto Prize and Templeton Prize, brought constitutive theory to light after studying the works of Johann Gottfried von Herder. Herder, a German philosopher and literary critic of the Enlightenment, critiqued the Hobbes-Locke-Condillac form of theory that tried to understand language within the representational epistemology of Descartes. Taylor argued that Herder distinguished between prelinguistic and linguistic beings: the first ones react to the surrounding world and the things around them, whereas the second ones are able “to grasp something *as* what it is” (Taylor, 2006, p. 18). A notable feature of the language, according to Taylor, is that it involves sensitivity to “intrinsic rightness” in evaluating the connection between the sign and the object, beyond simple aligning (Taylor, 2006, p. 21). This sensitivity refers to issues of the right use of signs. Such sensitivity allows humans to operate in another, semantic dimension, different from the one of animals. Semantic dimension makes humans, or agents, capable of new kinds of relations and new emotions, unique to those possessing the ability to use language. Herder postulated that without language no semantic dimension is possible, and Taylor argued that “to move from non-linguistic to linguistic agency is to move to a world in which a new kind of issue is at play, a right use of signs which is not reducible to task rightness” (p. 22). Thus, the world of agents has a different dimension on which to respond. According to Taylor, behavior can no longer be understood just as the purposive or cognitive seeking of ends.

This reflection, or perceptual judgment, creates a higher-order normative that is not only understood as enunciations (“Their friendship is strong.” “They are made for each other.”) but also as narratives. Narrative provides reflection in terms of time and action of the account (“They must have had some unique bonding experiences.” “They are just as in love as they were many years ago.”). Narratives can be structured in terms of metaphorical or metonymical dimensions, which are only possible in linguistic discourse.

A semantic-perceptual depth of linguistic human beings simply is not feasible in the world of prelinguistic creatures. Humans can go far beyond normal animal communication because animals only understand the explicit meaning of words.

Language provides more than just the possibility of communication as it ensures the possibility of interpretative reflection on explicit object recognition, semantic depth, and explicit narrative formation.

Constitutive theory enables humans to explain creativity and emotional aspects of their experiences through language. Constitutive theory brings our attention toward creative dimensions of our expression, and, as a result, it makes it possible for its own content to exist. Meaning is used in the phenomenological sense: something has meaning because it has relevance or significance. If things are significant in different ways, we refer to them as *new meanings* (Taylor, 1985). In short, the language is existentially constitutive as it accounts for descriptive as well as expressive modes.

Constitutive theory can explain how language gives the possibility of self-interpretation in light of explicitly expressed articulations in social narratives. Because humans are taught to understand and interpret themselves as individuals, or as parts of society, self-understanding is produced through social discourse and thus allows for true subjectivity. When one accepts the constitutive theory of language, they can see a comprehensive and highly complex web of social language interactions that happen as all possible variations of self-interpretations that can be developed and structured by historical, societal, and cultural particularities of various communities. One example might be interpretations of what actions might be considered socially responsible or what might be considered professional or ethical behavior. Self-interpretation and reflection continuously structure the life of human beings and affect all aspects of personal or social experiences, but without language, interpretation and reflection are not possible. Thus, languages *constitute* everything we know about the world.

CONSUMER/CUSTOMER RELATIONS

Public relations and consumer relations share many commonalities. In fact, some may argue that these two functions are “first cousins,” because they both seek not only to develop relationships between organizations and their key stakeholders but also to maintain and strengthen such relationships. To observe how this era of concern for relationship management has escalated, one needs only to channel surf via the radio or television or to skim the headlines of magazine and newspapers advertisements.

Everywhere, people are blasting out “relationship” cries of some kind. Banks, credit card companies, hotels, hospitals, automobile dealers, and the like promise that they are committed to offering “the right relationship” for you. Or type in “customer service” or “relationship management” as key words for an online Internet search; the hit count results are overwhelming.

The heightened concern for consumers can be traced to the early 1960s, when President John F. Kennedy mandated four bills of rights: the right to safety, the right to be informed, the right to choose, and the right to be heard. According to Robert J. Lampman (1988), two more have since been added: the right to enjoy a clean and healthful environment and the right of poor and other minorities to have their interests protected. Subsequent

presidents have also joined forces to encourage Congress to institute policies that serve to safeguard consumers. During his 1962 congressional speech in which he declared the Consumer Bill of Rights, President Kennedy explained the important role consumers (publics) play in our society: "Consumers, by definition, include all. They are the largest economic group in the economy, affecting and affected by almost every public and private economic decision. . . . But they are the only group . . . whose views are often not heard."

This era of consumerism has escalated throughout the years to more than just a plea from consumers to be treated fairly and ethically by corporate America. Today, consumers seek more interpersonal communication among the organizations they patronize. In tandem, organizations have a better understanding of the tremendous financial benefits they can potentially reap by maintaining relationships with the publics they serve. Market research consistently demonstrates that consumers no longer want to be treated as part of the "masses." They desire individualized, personalized service in combination with individualized, personalized information. And, if they aren't pleased with the product or service the organization provides, they are empowered to "move on."

But what is the *value* of a loyal consumer? That question can be answered in a variety of ways and addressed from an array of perspectives. In the business world, success is measured in dollars, one way or another. From a quantifiable standpoint, the value of a faithful consumer equates to repeat business—business that is much more cost effective to capture compared with the costs associated with generating new business.

Let's look at an example. According to experts in the lodging industry, nearly 55% of the business is represented by repeat customers. This means that more than half of the hotel industry's client base revolves around the "maintenance" component. Without the implementation of strategic public relations strategies and tactics to safeguard relationships among its client base, this industry risks falling below the profitability level.

In short, dissatisfied consumers will simply "vote with their feet" and go elsewhere. In fact, market research estimates that U.S. businesses lose nearly \$83 billion each year due to defections and abandoned purchases as a direct result of a poor

customer experience. Nearly two-thirds of consumers said they had ended a relationship due to customer service alone.

Managers need to make themselves available to listen to their consumers so they can analyze or measure organizational performance against the established marketplace standards. Implementing two-way mechanisms for obtaining feedback is a critical aspect of public relations management to enhance customer relations opportunities. Providing customers opportunities for feedback and the two-way flow of communication is an important part of the public relations process. Methods include providing customers with comments cards, a link to provide online feedback via the organization's website, 1-800 consumer telephone hotlines, focus group interviews, follow-up telephone calls, and satisfaction questionnaires. Engaging in "management by wandering around" offers another practical way to monitor the environment of an organization. And, having on-site managers available to personally talk with customers offers yet another chance for consumers to "connect" with the organization.

The previous examples clearly and quantifiably demonstrate the importance of maintaining relationships with external publics. Let us consider one of an organization's most important internal publics—the employees. A plethora of industries monitor and measure the costs associated with turnover and employee attrition rates. Using the example of turnover costs associated with losing an employee who earns \$8 per hour, sponsoring research organizations' results ranged from \$3,500 to \$8,000 in losses, taking into consideration direct, indirect, tangible, and intangible costs.

Aside from quantifying employees in terms of how much it costs to replace them, many scholars and business executives refer to them as "human capital." In short, they are part of an organization's investment and, therefore, represent a valuable asset. Let's put their worth in perspective by comparing them with another corporate asset. If managers of an organization make a financial commitment to purchase brand new, state-of-the-art computers for their employees, equipped with every bell and whistle imaginable, they also expand their commitment in other ways, such as making sure that the computers are maintained and kept "healthy" by equipping them with antivirus programs, that

employees are trained to use them to their full potential, and that their property is secured safely to diminish possibilities of theft. Similarly, these same managers should extend such concern for their “human” assets to make them feel safe, healthy, and motivated to work at their maximum level of potential.

One point that is constant among the consumer relations and customer service/satisfaction literature—regardless of the publics (internal or external), industry, product, or service under investigation—is that consumers are more apt to return (or stay) if they feel some kind of a personal connection to the product, service, or organization.

Relationship management plays a key role in maintaining customer loyalty and enhancing levels of satisfaction. And since public relations is a key component in supporting relationships between organizations and their key consumers, this management function aids in enhancing the consumer/employee retention rate, which, in turn, saves the organization money, thereby contributing to a lucrative bottom line.

When discussing customer service within the framework of public relations, we cannot negate the importance (and the power and influence) of word-of-mouth communication. For example, TARP research indicates that consumers who are dissatisfied tell as many as 16 friends about their negative experience. And a prominent study conducted by the White House Office on Consumer Affairs reveals that 13% of dissatisfied customers will tell 20 people about it. This “tell your friends” communication concept is similar to the multiplier effect, a term borrowed from the economic literature, which explains the trickling down of revenues. For example, when a person travels to a particular city for vacation, the local economy also experiences financial ramifications as well because these travelers spend money on local lodging, restaurants, entertainment facilities, and various other resources, such as gasoline, clothing, and souvenirs. If their experience is a positive one, the multiplier or word-of-mouth publicity may work in that city’s favor (e.g., the visitors will return home and tell friends and family about their favorable experience). If, however, the vacationers had a bad experience, the negative word-of-mouth publicity may work against the city. In short, the visitors are serving as informal public relations ambassadors

for the destinations they visit. To illustrate how this multiplier effect works with regard to social media, think about all the opportunities and tools consumers now have available to communicate with others. Ranging from Facebook, Twitter, LinkedIn, and Google Plus to Pinterest, YouTube and Instagram, just to name a few, the “you tell two friends” concept has escalated to “you tell virtually any and everybody” via these social media platforms. In short, “word-of-mouth” is now augmented by “word of ‘net.’”

Examples throughout this selection have illustrated how important it is for an organization to maintain a sound public relations program. They also demonstrate how quality customer service supports the public relations function. According to a social media blog by Simon Mainwaring, Mahatma Gandhi was quoted in 1890 and captured the essence of true customer service when he said,

A customer is the most important visitor on our premises. He is not dependent on us. We are dependent on him. He is not interruption in our work—he is the purpose of it. We are not doing him a favor by serving him. He is doing us a favor by giving us the opportunity to serve him.

Consumer relations represents an important spoke on the public relations wheel—one that should not be overlooked. And, consumers are not just defined by external audiences; employees play a dominant role in the success of an organization. Public relations management provides the linking agent between an organization and would-be satisfied consumers. In essence, satisfied customers are the end result of a well-orchestrated public relations program.

CONTENT AGGREGATION

Content aggregation is the perusal and collection of specific information from different online sources. Content aggregation is a search and listing of material from any website and may also be generated automatically from information feeds, sometimes utilizing keywords for the search. The process involves distribution of aggregated information to others, such as community members, colleagues, clients, or organizations. Content aggregation is also performed in order to share the collected content with others for a price. Sometimes content aggregation results in a specific website built to provide information on one topic while the information is collected from many different sites. Content aggregation in a simpler form is passing on an already established RSS feed that contains information useful to a certain audience.

This practice is important to public relations as many companies employ specific teams to perform content aggregation to support clients or provide information for marketing purposes. Specific teams may be in-house or a separate company. For instance, a company, such as KeyConcepts, uses computer programs designed to search the Web to gather information about an industry, key business leaders in the field, available jobs, and conferences. The gathered information is compiled into an extensive database.

Some companies hire employees to act as content aggregators, operating solely to source and compile elusive online information about a subject. A content aggregator is an individual, team, or organization that collects online information to use on a specific website or share with others.

Many content aggregators do this work by using keywords that help locate certain information. The information is compiled into assigned formats and used for personal reasons or shared. Professional content aggregators often fall into two fields: those who are hired to search online for certain information and those who make money by finding certain information and then selling it to others.

Content aggregation in its early forms is not a new phenomenon. Certain early websites, such as AOL, included a way to source and distribute content from other sites. Examples today include Internet news sites, Google News, Yahoo, and various social media outlets that allow for niche topics. The process of finding obscure references and information involving certain content is not easy. That is why until the last few years, it has been difficult to perform content aggregation well without an investment in tools that crawl and identify content.

Those who gather content with the express purpose of passing it on to customers are part of a process that can be labeled as syndication. Many companies offer this type of service. They include Moreover, iSyndicate, and ScreamingMedia.

A potential problem with content aggregation is plagiarism. The process can often appear as the theft of content. Therefore, aggregators should take specific steps to collect content for their audience in a legal manner.

CONTENT ANALYSIS

Content analysis represents the blending of qualitative and quantitative research methodologies focusing on messages. It provides users with an ability to take the qualitative message and quantify it using percentages and frequency counts. Further, content analysis can be used as a measurement tool. Content analysis is used quite extensively in public relations evaluation to better understand messages and how key people (e.g., editors and reporters) react to those messages; however, that use is typically in a

more informal, simple analysis. Hence, content analysis probably is best considered a qualitative public relations research method. Any type of content can be analyzed, including interviews, focus group discussions, editorials, television programming, and news releases, to name a few.

As a method, content analysis provides a way of systematically evaluating message content. If, for example, practitioners were interested in gauging news coverage regarding a promotional event, they might find all newspaper stories relating to that event and subject the stories to a content analysis. They might specifically want to see if the print media picked up a press release and, if published, how it was treated. A content analysis provides a way to evaluate the release's reach—how many papers published it, which is calculated as a percentage or “score.” If all 10 papers in an area picked up the release, the release would have 100% reach. How the release was reported, however, requires additional analysis. The analysis might focus on where the release was printed—which newspaper section, location on the page (above or below the fold, which quarter of the page, and so forth), the tone of the news article (positively reported, negatively reported, or neutrally reported), or the type of article (“straight” news, editorial, or column). Content analysis provides a way of evaluating the press release's impact on the event, albeit in a simplistic way.

Conducting a content analysis requires more than simple counting. The method is the most systematic of all qualitative methodologies and typically requires the practitioner to follow several steps. First, the practitioner must identify the type of content, establish the unit(s) of analysis, create a category system, obtain the messages, code the data in such a way as to quantify it, and establish coding reliability and validity. Each of these phases is critical in conducting and evaluating based on content analysis, especially since the creation of computer programs that can now conduct the mundane and time-consuming task of coding and counting.

Types of Content

Ole Holsti (1969) said there are two types of content that can be analyzed. *Manifest content* is the content physically observable in the messages. It is

simple and requires little analysis. For instance, manifest content might consist of a story's column inches or minutes of air time. It could be the number of times certain words or phrases were found in a story. *Latent content*, on the other hand, is not what is seen but what is unseen; latent content focuses on the underlying messages found in the message or the message's theme(s). Latent content might concern the tone of the message (positive, negative, or neutral), whether a particular theme was being followed through a campaign, or whether editorial content was good, bad, or neutral through a crisis. While manifest content is easy to code, latent content is more elaborate and often employs some measurement scheme or scale to evaluate the theme. Once the type of content is determined, the units to be coded must be determined.

Units of Analysis

Bernard Berelson (1952) suggested that content analysis employs five different units of analysis. A particular evaluation might focus on one or more of these units; the choice is determined by the questions asked. Four of Berelson's units focus on manifest content; in fact, he suggested that content analysis is best employed in evaluating manifest content. Berelson's manifest units are symbols or words, characters, items, and time and space measures; his latent content unit is the theme or thesis. *Symbols and words* are just what they appear to be: individual or company or event names, logos or trademarks, or articles of speech. *Characters* are units that describe such things as race, stereotypes, occupations, or personalities. *Items* are units that typically have a clear purpose, such as advertisements, editorials, television or radio programming, and forms of communication (e.g., newspapers, newsletters, and Internet chat rooms). *Time and space* measures include amount of air time given to a story, location within a newscast of a particular message, number of inches in an advertisement or story, or the physical size of a story, photograph, or advertisement. *Themes or theses* are units of analysis that must be analyzed and represent an underlying meaning; units, such as goodness, badness, sexuality, appropriateness, or fairness are latent thematic units of analysis. When latent content is being analyzed, the units must be specifically or operationally defined.

Category Systems

Once the content and units of analysis have been established, the content must be placed into appropriate categories. A good category system requires that each unit be placed in a unique category and that its placement not be dependent on other category systems. In creating a category system, the purpose of the research is reflected in the categories' meanings; the categories must be exhaustive—that is, all possible categories must be included and almost always include an “other” category; the categories must be independent of each other; and, finally, the category system must reflect a common classification system. Category systems are critical to content analysis reliability and must be defined precisely. A simple category system for adoption of a message includes the categories of “adopted” and “not adopted.” A thematic category system is more complex and requires that theme scales be created and evaluated; a fairness category might include scale items ranging from fair to unfair, negative to positive, and good to bad so that coders make decisions based on how the message was portrayed.

Obtaining Messages

Collecting and copying the actual content can be a time-consuming phase of a content analysis. If the messages are in print, they must be duplicated for analysis; if they are electronic, such as radio or television programming, they must be recorded and duplicated. When there are few messages and they are easily obtainable, then all messages are typically analyzed. When there are numerous messages, the population of messages is usually sampled. In sampling, a representative number of messages are randomly collected and analyzed. Suppose a practitioner wanted to evaluate if local newspapers picked up a press release. After identifying all the papers, each edition for a specified period of time is read and articles based on the release noted and copied. It is important that all editions of the papers are reviewed; some papers have more than one edition and the story may have been “bumped” from a later edition due to breaking news. Further, some papers may have special editions for different regions or neighborhoods. All this must be taken into consideration when obtaining the messages.

Coding

Coding occurs once the messages have been collected. A good content analysis employs at least two people other than the researcher who are trained in the category system to read each message and code the individual units of analysis into the coding system. Coding is as simple as counting the number of times a company's name appears in the media or as complex as determining whether that company's name is portrayed positively. In its simplest form, coding is the placing of the units into the appropriate category or, as in the case of a theme, placing a mark on a series of scale items.

Establishing Reliability and Validity

Coder reliability and validity is an important feature of content analysis. It is the only qualitative method that allows for an estimation of reliability and validity. Coding reliability, a prerequisite for validity, can be computed. Typical reliability estimates are reported using Holst's reliability coefficient or Scott's pi index. Both provide a reliability estimate from 0 to 100%; a coding reliability of at least 90% is desirable, meaning the coders agreed 90% of the time. To ensure that coding is being conducted in a reliable manner, the coders are often trained to code within an agreeable reliability. Coding validity is less quantifiable and is evaluated by the specification of the units of analysis (are they appropriate?), how the units were defined, and whether the category system meets the five criteria specified earlier.

Computer-Assisted Content Analysis

There are a variety of computer programs that perform the actual placement of messages into categories. Computer-assisted content analysis reliability is, however, still dependent on the decisions made by the researcher in creating the content analysis. The computer dependably counts the units as defined to it and places them in the categories if instructed, but if the units are inappropriate or the category system flawed, then the results are questionable. Computers have not proved very useful in thematic content analysis.

CONTINGENCY THEORY

Contingency theory in public relations refers to the virtue of a strategic approach to decision making adjusted to desires or demands of publics. Contingency theories as a genre in the organizational arena argue that there is no single best way to lead or make decisions. Choices are contingent on factors important to each situation. The contingency theory in public relations features this approach in determining the stance or position of an organization in each organization–public interaction.

When introduced in 1997 by Amanda E. Cancel, Glen T. Cameron, Lynne M. Sallot, and Michael A. Mitrook, the concept of the contingency theory of accommodation in public relations was simplified to a tagline—“It depends.” How an organization interacts with its publics “depends” on or is contingent upon a variety of internal and external variables. Furthermore, that interaction or organizational stance is dynamic—it changes with the situation.

Background

The contingency theory in public relations had its genesis as an extension of concepts central to the excellence theory of public relations, which was developed by James E. Grunig and colleagues. Excellence theory was developed as a normative theory that proposed the most ethical and excellent practice of public relations employed two-

way symmetrical communication between an organization and its publics. Contingency theorists, led by Cameron, began to examine the positive (i.e., how public relations is practiced rather than how it should ideally be practiced) theoretical value of two-way symmetry, which they called pure accommodation.

Rather than proposing a single-best approach to public relations practice, contingency theory argued that public relations strategies are nuanced. Such nuance was developed around more than 80 variables that were based on internal (e.g., organizational culture, organization’s past experiences with the contending public, characteristics of the dominant coalition) and external (e.g., threats of litigation, degree of support for the organization, size and credibility of the contending public) forces that might be at play in an organization’s public relations decision making. These variables were further classified as situational and predisposing. Predisposing variables are those that exist prior to an interaction with a public and thereby predispose the organization to react in a certain way. Predisposing variables include items like organizational culture, the organization’s size, and individual characteristics of people involved. Situational variables are situation specific and include items like the urgency of the situation, the characteristics of the contending public, and potential or clear threats.

These variables, contingency theory posits, affect whether an organization accommodates a public or advocates solely the perspective of the organization. These stances run along a continuum with pure accommodation (i.e., capitulation to a public’s demand) at one end and pure advocacy (i.e., unyielding support for the organization’s position regardless of public pressure) at the other end. Contingency theory argues that the interplay of variables determines where on the continuum an organization positions itself in response to a public’s expectation in each situation.

Key Concepts

Stance

According to contingency theory, the stance an organization takes may run up and down the contingency continuum between pure accommodation and pure advocacy. Whether the organization–public relationship is collegial or adversarial, a position

or stance is taken regarding the most effective way to interact with the public. Stance likely changes as the relationship and external and internal organizational factors vary. In short, the stance an organization takes is influenced by the circumstances in which the organization finds itself.

Stance is further refined by contingency theorists as action-based accommodation or qualified-rhetorical-mixed accommodation. In action-based accommodation an organization may yield to a public's demands or enact a public's solutions. In qualified-rhetorical-mixed accommodation an organization may express regret or apologize for an action or make concessions to the public.

Accommodation and Advocacy

The continuum that visually illustrates the contingency theory has as its endpoints pure accommodation (making concessions to the other party exclusively) and pure advocacy (arguing the organization's own interests exclusively). Of course, either pure accommodation or pure advocacy is seldom the best stance for an organization to take; therefore, stance moves up and down the continuum between the two poles.

Dynamism

Public relations is a dynamic profession. In a world of microblogs, cameras on mobile phones, and a 24/7 news cycle, the situation an organization faces can change in an instant. Contingency theory accounts for this dynamism via its extensive list of descriptive variables and continuum.

Strategy

As noted above, stance is the central concern in contingency theory. The stance an organization takes in an organization–public relationship drives strategy and tactics. Obviously, given the same set of circumstances an organization that is taking a stance closer to pure advocacy will employ different tactics than if it takes a stance closer to pure accommodation. Perhaps persuasion or coalition building is employed when the stance is strong advocacy, while accommodation may simply require meeting with members of the public to explain how their request is accommodated.

Conflict Management

Contingency theory in public relations was initially labeled the contingency theory of accommodation. As scholars began testing and extending the theory, it became clear that the theory was especially useful in describing stance and prescribing tactics when an organization was faced with conflict. Researchers labeled it the contingency theory of strategic conflict management. Today, much of the research embracing contingency theory involves conflict or crisis management. However, it is used in studies of both conflict and collaboration.

Extensions and Applications

Proscriptions

Six proscriptions to accommodation were tested in an effort to bring some parsimony to the unwieldy matrix of variables outlined in contingency theory. In interviews with public relations executives, the proscriptions were identified. Moral convictions, trying to appease multiple publics, being constrained by regulatory bodies, internal organizational jurisdictional issues, attitudes of top management, and being constrained by legal counsel were all identified as proscriptions to accommodate to a public's demands.

Emotions

Not only do the contingency variables affect stance, but scholars have also demonstrated that so do the cognitive and affective responses of the players involved. An emotion-laden contingency model is illustrated by a plane rather than a continuum. Emotional tone, weight, and temperature of a variable can have an additional effect on accommodation. For example, perhaps the internal factors of business exposure and past experience with the contending public are in play, but while the business exposure is substantial, the emotional baggage that accompanies a bad past experience with the public in question gives greater weight to past experience as it affects organizational stance.

Threat Appraisal Model

More recently contingency theory has been extended by development of a threat appraisal

model. This model employs the contingency theory matrix of variables to identify threats to an organization and prescribe appropriate messaging or stances.

Contingency theory has been used to identify organizational stances in a crisis and examine the interaction of legal and public relations counsel in litigation public relations. Contingency theory has been tested and developed in international settings, notably China and Korea.

Critique

Throughout the development of the contingency theory in public relations, some critics have argued that it is nothing more than an extension of excellence theory. While development of contingency theory may have begun as a means to examine the stance of two-way symmetry as normative, its extensive empirical testing and extension since 1997 have carved out its own niche as a theoretical perspective on the practice of public relations.

CONTROL

Control is one of several variables basic to many scholarly disciplines and a basic theme of best practices of public relations. Such is the case because control is fundamental to human existence. People want control over matters relevant to their health, safety, and general well-being. They try to minimize risks or otherwise control them, for example, by acquiring specific knowledge and learning special skills. They may take driver's education to master the operation of an automobile. That knowledge and skill allows them to calculate and adapt to the behavior of other drivers and pedestrians. Traffic rules are created and enforced as a means for controlling the flow of traffic and the operation of vehicles.

Society is composed of many professional roles, such as fire and police personnel, who are expected to assist citizens' efforts to control events in their daily routines. Chefs seek to control the quality of

food. Plumbers work to control the flow of water. Electricians learn means for controlling electricity. The list goes on and on. And, it suggests that control is not inherently bad and often is a positive factor in the quality of life. The challenge of “control” comes into focus when one or more entity works to control another. Even that is not inherently bad. Parents control the movement of infants and children for their safety. The issue is control that is unwanted, unwarranted, and undeserved.

Executive managements of companies want to control factors that enhance their chance of business success. Business entails risk taking; control is a regulative concept to increase the benefits of risk and minimize its harms. That is a basic principle of management. Financial reports announce controls; for example, cost control by technology innovation or personnel layoffs. Executives seek legislation and regulation that foster control over their enterprises. Bellwether companies often advocate, through industry trade associations or government agencies, higher operating standards that can reduce the likelihood that bad-apple companies damage the reputation of an industry by not being able or willing to exert appropriate controls. Or one industry seeks to control its operations by forcing controls onto other businesses. For this reason, the automobile insurance industry advocated more government regulation to achieve safer automobile designs. Such designs help reduce the business liability for insurance companies, as does stricter drunk driving legislation. Society benefits from the exertion of such control.

Products and services are advertised and promoted to help customers increase control over various aspects of their lives. Diet medications are touted to increase weight control; dental products to reduce tooth decay. Savings plans and insurance policies give people more control over their financial future.

On the other side of the coin, activism arises from a desire on the part of citizens—stakeholders—to control aspects of their life. Environmental activists believe that businesses (and various governmental agencies) exert either too much or too little control over their operations in ways that damage the environment. Thus, activists want to control corporate management through legislation, regulation, litigation, or consumer pressure.

Nonprofit organizations serve society by exerting control to solve societal problems where

businesses or government fails to meet the challenge, creates the challenge, or needs special values or skills to meet the challenge. The Red Cross works to help people restore control over their lives when disaster occurs. Health-oriented nonprofit organizations, such as the March of Dimes raise money and apply it to research, therapy, and prevention, to control disease or reduce its impact on individual lives and community health. Fundraising is an essential nonprofit activity seeking to bring stakeholders together to exert control in the interest of the community.

Because control is a central part of human experience, it is vital to the theory and practice of public relations. The concept has received substantial discussion by scholars as well as practitioners. It has strategic and ethical implications for the ways organizations operate and foster relationships with their stakeholders.

The history of public relations is inseparable from the desire and ability of various organizations or persons to direct and control the opinions and behaviors of others. Organizations must be able to control their activities and predict how others respond accordingly. Thus, companies seek to attract customers to help them control—bring order to—their business activities for orderly, well-managed operations. Organizations of all kinds, for instance, want to control the efforts of employees. They want to direct, regulate, and coordinate those activities. One rationale for employee communication is that it helps organizations manage the time and talents of employees to accomplish collectively a specific mission. In contrast, a fundamental motive for activists of all kinds is to oppose efforts by a company, for instance, to exert a level of control in some manner that offends the values, interests, and opinions of activists. In this sense, even labor unions can be activists trying to exert control against management over wages and working conditions.

Interpersonal communication theory and research offer insights into the nature of control and the role it plays in human communication. Carried to an extreme, control can equate with domination that is likely to harm relationships and, in the case of public relations, motivate opposition rather than support by stakeholders. Under the best circumstances, control should be a comfortable balance between the power exerted and

preferred by all parties in a relationship. For this reason, public relations can be practiced as relationship management, based on many factors, including the alignment of interests.

Writing on interpersonal relationships, Frank E. Millar and L. Edna Rogers (1987) featured control as one of three concepts central to the quality of a relationship. The other two concepts are trust and intimacy. Trust and intimacy are relevant to the sorts of relationships public relations practitioners work to build on behalf of clients and employers. Trust refers to a person's or organization's ability and willingness not to exploit or take advantage of the vulnerability of parties engaged in a relationship. Intimacy includes liking. The equation is simply this: Control wisely used builds trust and fosters liking. Organizations must use control strategically and collaboratively as they work to build trust and to be liked—supported—rather than opposed.

Control entails the right and ability of parties to a relationship to define, direct, and limit the actions that transpire to build the relationship and results from the ways participants act toward each other as a consequence of the relationship. Trust results from the responsible use of control. In relationships, each party is vulnerable to the other in various ways. Trust results when each party is willing to support rather than oppose the other and to avoid taking advantage of the other party's vulnerability. Dominance is a function of the willingness and ability of one party to influence outcome and to exert power, without opposition.

Since control is a function of codefinition and relationship development, it is a matter of perception and relationship comfort. The balance between the controls exerted by each party in a relationship is subject to the perceptions and expectations of each party. Various publics, for this reason, may feel comfortable with the amount of control being exerted, for example, by a company or a government agency, whereas other publics may believe that too little or too much control is exerted.

One rationale for public policy battles is the clash over appropriate amounts of control. Activists, for instance, seek to increase their control over corporate activities by increased amounts of regulation or legislation—even litigation. Stakes are a power resource held by the parties in a relationship. Customers hold the stake of buying power. Activists hold the stake of legislative influence.

Companies hold the power of legislative influence as well as their ability and willingness to control their operations as others expect of them. For this reason, issues management has a lot to do with the clash over the dynamics of the public policy arena that lead to or away from the use of control to regulate the affairs of each society.

One remedy to control conflict is for organizations to be more willing to share control with stakeholders thereby leading to aligned interests. Another remedy is to increase controls (such as raising engineering and operating standards to reduce environmental emissions) or to use control for the community interest rather than for the narrower self-interest of the organization or industry.

Another dimension of public relations and control is the role of crisis management and response. A crisis occurs when an organization fails to exert the appropriate amount or type of control over its activities. Crisis management and response entails an organization either recognizing and acknowledging how it must control its activities or suffering a remedy imposed from the outside. One classic crisis management response is to discuss the reason for the crisis, looking to determine whether the organization exerted appropriate amounts of control in the public interest. Such analysis, as lessons learned, can lead an organization to reduce the recurrence of a crisis by learning what control measures reduce the risk that led to the crisis.

Risk communication is a challenge for organizations that create risks and/or are expected to manage and mitigate them in the "public" interest. They are expected to share information that can help stakeholders to understand the risk and determine whether the organization is exerting appropriate controls. This dimension of risk management and communication was very much at play on the part of the airline industry after the terrorist destruction of the World Trade Center on September 11, 2001. Airlines were faulted for not exerting appropriate control over what passengers could bring onto airlines, what weapons they could obtain within the airplane, and the ease with which they could gain access to the cockpit.

Control tells a lot about a relationship, and for this reason it is essential to understanding the role and practice of public relations. People expect organizations to exert control appropriate to their role in society. Stakeholders seek to right situations

when they believe a lopsided amount of control exists in a relationship. Public relations practitioners see value in understanding and positioning organizations to foster all stakeholders' sense of what is good for the community, a matter of public interest, and achieved through collaborative decision making.

CONVERGENCE AND PUBLIC RELATIONS

Media convergence refers to several concurrent phenomena: the increasingly blurred boundaries between different media content and delivery formats, the ability to concentrate access to multiple communication technologies in a single device, and the concentration of cross-media ownership and control that began with deregulation in the United States in the mid-1980s. Together, these forces are transforming the global communication landscape and thus have profoundly affected the field of public relations.

From the standpoint of content and technology, much of what has been written about convergence focuses on what media scholar Henry Jenkins referred to as the “Black Box Fallacy,” the idea that we will someday rely on a single communication appliance for all of our needs. As he pointed out,

this fallacy conflates the notion of media content with delivery systems. As the proliferation of devices available for home, mobile, and professional use shows, today’s technological capabilities instead make it possible to produce a vast range of items that people can choose from to suit their peculiar needs in different contexts.

Media content is converging in the sense that, for example, a newspaper is just as likely (if not more so) to exist in electronic form as printed on paper; television can be broadcast, transmitted via subscriber cable systems, or uploaded to servers for on-demand online viewing. Furthermore, one might view a particular program—for example, *The Daily Show*—in multiple ways: on cable television, on the television channel’s own website and YouTube channel, or on a dedicated site, such as Hulu. The producers can also make clips available for sharing, so that individual content producers can display them along with other content, ranging from a news aggregation site, such as The Huffington Post, to a personal blog, to social networking sites, such as Facebook. The technological convergence described above means that media consumers can view the episode or clip on devices ranging from a traditional television set to a personal computer to a mobile phone, and that viewing may happen at virtually any point in time.

Convergence has numerous implications for public relations practice and scholarship. Practitioners need to be conversant in the production and delivery of media across a broad range of platforms to effectively reach stakeholders. Audience and stakeholder engagement measures face new challenges, as stakeholders may consume organizational messages in one format or on one platform and share, comment, or organize a response via another. While this ability by users to detach the media content from its original context is often encouraged as a sign of stakeholder engagement, it also leads to a loss of control by media producers, who can no longer dictate the specific circumstances in which the media is consumed. As a reaction, consolidated media companies may place demands or restrictions on multiplatform content to maximize profits and viewership of their various properties. The long-term archiving and searchability of any media content stored electronically also means that people may be exposed to content long after it was originally produced, which can make it

difficult for individuals or organizations to leave negative situations behind, even if they have changed considerably since the recorded incident.

Practitioners must therefore take all of these challenges into account when developing and implementing messaging strategies and determining how to measure their effectiveness. For example, many organizations find that mobile apps are an effective means for bringing information and content into the hands of stakeholders to build and maintain relationships. Platform and technology ownership of various channels can play a role in determining patterns of power and influence, such as the interdependencies among Google's search, social networking, document-sharing, and mobile Android spheres, which may affect the visibility and diffusion of content distributed via these channels compared to other means. Policies for the distribution of user-produced apps also vary based on the technology used, meaning that public relations professionals need, more than ever before, to be aware of stakeholder behaviors and preferences when deciding which platforms to include in any communication strategy.

Despite the difficulties posed, the ability to effectively leverage multiple convergent media can allow practitioners to maximize opportunities for reaching and engaging in productive dialogue with stakeholders. The consolidation of mass media coincided with an abundance of platforms for user-generated content; as a result, many organizations are developing and distributing their own media products. The field of media relations is therefore shifting dramatically, as traditional placements become both more competitive and more concentrated. Video, audio, and electronic production skills are in great demand among new hires, in addition to the traditional emphasis on writing and strategic thinking, as public relations firms and departments are becoming increasingly responsible for producing and distributing multimedia and cross-platform content, often on short notice and a limited budget.

For their part, researchers are also increasingly willing to ignore previously distinct boundaries between media channels, treating the media landscape as a system that crosses delivery technologies as well as social contexts, in order to understand the communication environment in which public relations is practiced today. In studying communication

by or about organizations or issues, it can be overly limiting to focus on a single medium, while at the same time the complexity of the convergent mediascape can make it difficult to employ traditional research techniques. For example, the same content may be posted several times, in different contexts, perhaps in some combination of visual and text-based media, which can complicate data collection. Scholars now also face new questions concerning the sharing and consumption habits of content by stakeholders, raising epistemological questions about the relative roles and patterns of influence among media producers, consumers, and technology companies.

Given the social and economic pressures urging organizations to cater to a diverse array of stakeholder communication preferences, and technological advances that simplify the diffusion of information across multiple media, convergence is bound to play an increasingly important role in the design and implementation of public relations strategies and the development of new cross-platform research methods.

CO-OPTATION

Co-optation is a strategy used by dominant institutions or organizations to respond to and potentially neutralize activists who threaten to

disrupt the dominant group. The strategy takes a variety of forms, but essentially involves the more powerful organization creating the appearance that it shares the less powerful group's aims, granting some concessions, or sharing power with the less powerful group. The effect is that the activists appear to have earned a compromise or even outright victory, but the underlying behavior of the dominant organization remains unchanged. Co-optation is related to public relations because the strategy often involves communication or forming new patterns of relationships. In critical studies of public relations, co-optation is viewed as a way in which unfair power relationships in society are perpetuated. However, some of the tactics associated with co-optation may actually be good faith efforts by organizations to create symmetrical relationships with activist publics.

Co-optation can take many forms. One of the more common strategies is to identify the organization's opponents and their issues, then invite leaders of the opposition to meet with the organization under the guise of working together to address those issues. Indeed, there might even be plans formulated and partnerships forged. For example, the Sierra Club accepted over \$25 million in donations from Chesapeake Energy Company, a major natural gas producer, to fund the Club's "Beyond Coal" campaign. While many environmentalists support natural gas as a cleaner alternative to coal, the process of extracting natural gas from shale involves some environmentally questionable techniques, such as hydraulic fracturing ("fracking"), which may harm water supplies. During the period that the Sierra Club received the donations, its executive director was a vocal advocate for natural gas. Once the donations were revealed, the Sierra Club severed its ties with Chesapeake Energy but still faced questions from its supporters. Partnerships formed under this type of co-optation typically are widely publicized, and the corporation can claim that it is working with activists to achieve shared goals (e.g., protecting the environment). However, in the long run, the underlying operations of the company are largely undisturbed.

Other forms of co-optation involve borrowing the symbols or language of activist movements to make the dominant organization appear to be cooperating with activists' demands. Some environmentalists have accused corporations of "greenwashing"

their products. Environmentalist Andy Rowell offered the examples of "environmentally friendly" automobiles and "ozone friendly" aerosols that while appearing to be responsive to the problem of air pollution actually mask other environmentally damaging corporate practices. Related to this is the use of front organizations with names that make them sound like grassroots citizens groups, but which are funded by corporate interests. For instance, Americans Against Food Taxes is an organization largely funded by the soft-drink industry to oppose efforts by some childhood obesity advocates to tax sugared drinks.

Some activists even cast suspicion on the process of dialogue between corporations and activists, claiming that corporations use discussion as a delaying tactic. This suspicion creates a double bind for corporations that work in good faith to resolve issues with activists. On the one hand, dialogue is an important component of symmetrical relationships with activists; on the other hand, some activists see dialogue as the first step toward co-opting the movement.

CO-ORIENTATION THEORY

Co-orientation occurs when two or more individuals are simultaneously oriented to one another and to something of mutual interest. The assumption is that individuals behave toward each other based on their *perceptions* of the other's views and intentions regarding the object of mutual interest.

For example, after Senator George J. Mitchell returned from one of his many trips to Ireland and Great Britain in his role as mediator, he described the difficult environment in existence when he was trying to help forge the Northern Ireland Peace Accord: "Each side acts based on its assumption that the other side will not keep its promises" (Mitchell, 1999, n.p.).

Groups of individuals, then, also act toward other groups based on perceptions of other groups' views, positions, and intentions. Similarly, organizations and their publics deal with each other based on the collective perceptions of the other's views.

Organization–Public Agreement Versus Perceptions of Agreement

Typically, public relations practitioners use public opinion surveys to determine public knowledge and opinion related to issues important to their organizations. The results are used to determine differences between organizational orientations and positions on issues and those held by various publics. Some refer to the process as "gap analysis," meaning the differences are seen as measures of *agreement* between organizations and publics. Agreement, then, is a measure of how similar or dissimilar an organization's views are to those held by various publics.

Using what is often called a "public relations audit," practitioners first determine "what we think." Second, they attempt to measure or to estimate "what 'they' think" (publics). Third, they assess the magnitude and seriousness of differences between organization and public views. A public relations problem exists when gaps are found, leading to a recommended public relations program to "close the gaps"—to increase agreement between the orientations held by an organization and those held by its publics.

In such cases, public relations strategy typically represents a program of action and communication

(usually dominated by persuasive communication). Implicit to such an approach is the assumption that a public's opinion of and its behavior toward an organization are determined by the magnitude of the gaps—the level of agreement or disagreement. Additionally, there is an assumption that if the gaps are small or there are no gaps, then public opinion and behavior are consistent with organizational needs and views of public interest. Both assumptions are easily challenged.

Actual Agreement Versus Perceptions of Agreement

First, the extent of actual agreement or disagreement usually is not known either to those in an organization or to members of a public, as accurate information is seldom available. Consequently, both sides in organization–public relationships behave toward and react to the other based on their *perceptions* of the others' views and *perceptions* of how close they are to their own views. As T. J. Scheff (1967) pointed out in his explication of "consensus," (a) perceptions of agreement can be independent of the level of actual agreement, (b) the level of actual agreement is not known to those involved, and (c) perceptions of agreement affect the behavior of those involved in a relationship.

Using measures of actual and perceived agreement, Scheff (1967) defined *monolithic consensus* as actual high agreement that is accurately perceived by a majority of those involved. He defined *dissensus* as the state when actual disagreement is perceived accurately by the majority. Accuracy is the key variable, however, as *false consensus* represents a state of actual disagreement that is inaccurately perceived as high agreement. Similarly, Scheff called the state when actual high agreement is perceived as disagreement *pluralistic ignorance*. When those involved have inaccurate perceptions of others' views, they behave inappropriately toward them based on what they erroneously believe to be the others' orientation.

To avoid inappropriate public relations responses and strategies based on misperceptions, organizational intelligence gathering must discern the cross perceptions held by both sides in organization–public relationships. The J. M. McLeod and S. H. Chaffee's (1973) interpersonal model describes how two individuals are simultaneously oriented to an object and to each other—"co-orientation"

(pp. 483–485). Their model extended previous attempts to describe relationship states by incorporating R. F. Carter's (1965) notions of "salience" and "pertinence" (pp. 203–204). *Salience* represents an individual's summary evaluation of the object of orientation. *Pertinence* is the individual's object-by-object comparisons based on attributes that objects have or do not have in common. In other words, an individual's orientations comprise both evaluations and definitions of objects (the top boxes in Figure 1). In addition, an individual holds perceptions of how the other evaluates and defines the object of mutual concern (the bottom boxes in the model).

The parallel orientations and cross perceptions are used to calculate both intrapersonal and interpersonal co-orientational variables (represented by the arrows in the model). *Congruency*, or perceived agreement, represents the extent to which Individual A's own views are similar to A's perceptions of Individual B's views. This intrapersonal variable clearly does not take into account the other person's actual views but surely serves as the basis of A's responses and strategy for dealing with the other person.

Interpersonal *agreement* indexes the similarity of A's and B's views—both salience and pertinence—held by the parties. *Accuracy* measures the extent to which A's estimate of B's views are similar to B's actual views. The interpersonal model can be adapted to public relationships by substituting an organization and one of its publics for the "individuals" more typically conceptualized in the model.

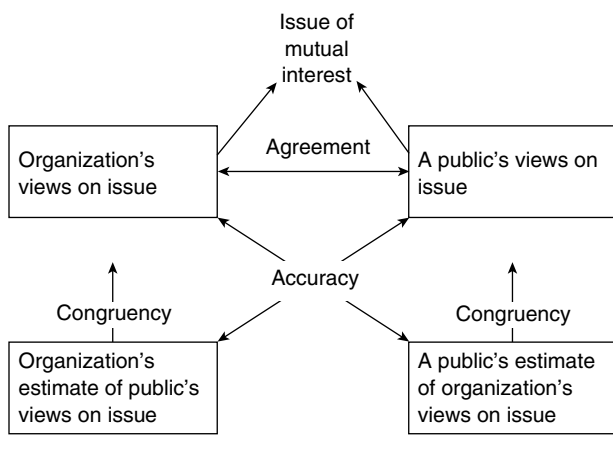

Figure 1 Co-Orientation Model

Source: Adapted from McLeod, J. M., & Chaffee, S. H. (1973). Interpersonal approaches to communication research. *American Behavioral Scientist*, 16(4), 484.

Intraorganizational congruency represents the dominant views within the organization of how close or far apart organizational views (salience and pertinence) are from perceptions of the views held by one of its publics. *Intrapublic congruency* indicates the extent to which a majority of a public perceives a difference between public views and those held by the organization. How the organization deals with its publics and how a particular public deals with the organization are a function of their respective levels of congruency—perceived agreement or disagreement.

Organization–public agreement takes on two values—the extent to which an organization and one of its publics hold similar evaluations of the object or issue of mutual interest and the extent to which they hold similar definitions of the object or issue. For example, even if an organization and one of its publics share similar evaluations of an issue, they may not agree on the details of the issue. Or they may agree on the specific attributes of the issue but disagree on its valence or importance. In most cases, disagreement on either evaluation or definition of issues of mutual interest creates public relations problems.

Organization–public accuracy represents the extent to which an organization's estimate of public views matches that public's actual views and vice versa. Chaffee and McLeod argued that "perfect communication" . . . would not necessarily improve agreement . . . might well reduce congruency . . . (but) should always improve accuracy . . . to the point where each person knows precisely what the other is thinking" (1970, p. 9). Likewise, effective public relations two-way communication leads to high accuracy for both organizational players and those in the target public.

Describing Co-Orientational Relationships

Co-orientational measures of organization–public relationships require data on the following:

1. How organizational management defines and evaluates the issue
2. What organizational management thinks about how each of the target publics defines and evaluates the issue

3. How each of the publics defines and evaluates the issue
4. What each of the publics thinks about how organizational management defines and evaluates the issue

These data—the boxes in the model—are necessary for calculating the co-orientational variables—the arrows in the model.

Beyond describing the levels of agreement, congruency, and accuracy separately, one can combine these variables to describe relationships. The 1967 typology of consensus by Scheff, although not originally intended for this purpose, serves as a model for defining organization–public relationships from the perspectives of the parties involved.

For example, if organizational management and most of a particular public have similar evaluations and definitions of an issue of mutual concern, and they both recognize that they agree, then they have achieved the state of *consensus*. If the organization and its public do not agree on either the evaluation or the definition of an issue, and they accurately recognize that they disagree, then the state is *dis-sensus*. These represent the states of accurate cross perceptions. However, two qualifications apply: (1) agreement or accuracy may not apply equally to both the evaluations and definitions of the issue of mutual interest, and (2) agreement or accuracy may not be shared, thereby producing consensus or dis-sensus from the perspective of only one side of the relationship.

In a case of *false consensus*, one or both sides may think that there is a higher level of agreement than actually exists. Even though there is low agreement on the issue, one or both sides of the organization–public relations perceives high levels of agreement . . . and behaves toward the other based on those inaccurate perceptions. Eventually a critical incident forces a reality check, thus revealing the actual level of disagreement. Lost time and false starts are the costs of these relationships.

Likewise, if one or both sides perceive higher levels of disagreement than actually exist, then the relationship could be referred to as *false conflict* (Scheff's "pluralistic ignorance"). In this state of low accuracy, the actors think—and act—as though they disagree, developing needless strategy based on the perceived disagreement—avoiding,

challenging, undercutting, and criticizing each other. Without outside intervention and facilitation, the parties involved may never develop appropriate strategies for dealing with one another. Waste and lost opportunities are the costs of these relationships.

The public relations problems that result from each of these states call for significantly different strategies. If the organizational actors and a public hold different evaluations or definitions of an issue, a persuasion strategy may be necessary—both inside and outside the organization. If they do not recognize that they agree or disagree, then an information-sharing intervention can increase accuracy.

Absent data on the true state of actual and perceived agreement, public relations strategy—just like behavior in interpersonal relationships—may be unnecessary or inappropriate. One can imagine effort and resources wasted on programs designed to persuade publics to accept positions to which they already subscribe. Alternatively, one can imagine situations in which publics protest imagined or rumored organizational positions that do not accurately represent the organization's actual stance, which might be in accord with those of the publics.

Early co-orientational studies in public relations explored relationships among internal organizational publics, between schools and their community constituencies, and between public agencies and their publics. Recent studies using co-orientational designs analyzed relationships between public relations practitioners and lawyers, as well as between government and corporate practitioners.

The imagery of co-orientational relationships again makes clear the important role of research in public relations. Framing responses to publics and formulating strategy for building and maintaining relationships demand that public relations counsel is informed about the actual and perceived levels of agreement on both sides of organization–public relationships. Accuracy is the critical variable, not agreement.

COPY

Copy is written text that will be printed. It may be informative or persuasive in nature. It can be used in reference to articles that appear in newspapers or magazines. It can also refer to the text of advertising.

In the context of public relations, copy may take many forms. These include press releases, fact sheets, backgrounders, brochures, newsletters, reports, speeches, position papers, and press statements. When writing copy, public relations practitioners must be mindful of the interests of the organizations they represent as well as the needs of their publics.

In order to write good copy, public relations writers must understand the organization and its

purpose for communication and know the public for whom the piece is written. To do this, the practitioner must be certain that the copy answers all pertinent questions while emphasizing the points the organization believes to be most important. To write copy well, it is important to possess an intimate knowledge of spelling, grammar, punctuation, appropriate capitalization, appropriate abbreviations, and language usage. In addition, good copy is accurate, brief, and clear. It is essential for a writer to be accurate because mass audiences tend to believe what they see and read in the media.

Practitioners are ethically bound to disseminate only that information that is factual and correct; often, their credibility and reputation depend on it. Most writers are limited to a certain amount of space, as measured by column inches or pages, and therefore learn the merits of brevity.

Last, clarity is an important goal because it helps mass audiences to understand the writer's intent. Copy usually follows a particular stylebook, whether that of the organization or a commonly used one, such as *The Associated Press Stylebook*. Stylebooks effect consistency by establishing rules for items, such as correct word usage, weights, measures, capitalization, titles, and abbreviations. Stylebooks should not inhibit creativity, but rather enhance readability via consistency.

Well-prepared copy adheres to the elements of news value, such as timeliness, consequence, prominence, and proximity. Many public relations practitioners follow the inverted pyramid style in their writing as do journalists. When using the method, copy is presented with the most important information first and additional information introduced in descending order. This style is followed in the hopes that it grabs an editor's attention and the piece is published. In addition, it ensures that the most important information is not cut if space is limited. Editing and rewriting are integral parts of the writing process and help writers to meet the goals of providing factual information that is brief and clear while adhering to stylebook rules.

COPYRIGHT

Before the European Enlightenment, there was no concept of copyright. It was the product of a shift from seeing knowledge as divine revelation to seeing knowledge as created by people. In the 1500s, the issue of ownership of intellectual property was largely moot because of the licensing system, because the government granted a monopoly to printing companies, and authors had little say in the matter if they wanted to be published. With the decline of licensing arrangements (in part because of an increasing resistance to censorship), and with both an increasing literacy and a resultant increasing demand for knowledge, the issue of ownership took on greater importance. Two justifications were offered for copyright protection for authors—natural rights and utilitarianism. The natural rights justification was that people had a natural right to dispose of, and benefit from, the product of their labor, whether mental or physical. The utilitarian justification was that copyright was the best means of encouraging the development of new knowledge that benefited society. The first copyright statute in the Western world, the Statute of Anne (1710), was a compromise between the two positions as its full title indicates—“A Bill for the Encouragement of Learning and for Securing the Property of Copies of Books to the Rightful Owners Thereof” (Hesse, 2002, p. 38). The basis of United States copyright law, the federal Constitution, has a similar approach. As set forth in Article 1, Section 8, Congress has the power to “promote the Progress of Science and useful Arts, by securing for limited Times to Authors and Inventors the exclusive Right to their respective Writings and Discoveries.”

What can be copyrighted are “original works of authorship fixed in any tangible medium of expression, now known or later developed, from which they can be perceived, reproduced, or otherwise communicated, either directly or with the aid of a machine or device” (1997, 17 U.S.C. §102[a]). This includes literary works, musical works, dramatic works, pantomimes and choreographic works, pictorial, graphic, and sculptural works, motion pictures and other audiovisual works, sound recordings, and architectural works, but “any idea, procedure, process, system, method of operation, concept, principle, or discovery,

regardless of the form in which it is described, explained, illustrated, or embodied” cannot be copyrighted (1997, 17 U.S.C. §102[b]).

While it is intended that copyright is invested in the creator of the work, this is not the case for works for hire, either within the normal scope of employment or commissioned works. In these cases, the employer is considered the author. The parties involved in the employment situation may change this by contract.

Copyright exists from the time of the creation of the work and registration is not required. To register for a copyright, a completed application form, a filing fee, and two copies of the work (one if unpublished) are filed with the copyright office. Notice in the form of some sort of recognizable abbreviation or symbol, name of the copyright holder, and the date should be placed on the work in a noticeable place. Although registration or notice are not required, there are certain advantages to registration. For example, there may be pride of ownership in claiming the creative activity, certain copyright infringement actions cannot be initiated absent registration, and no statutory damages or attorney fees can be awarded without registration. Duration of the copyright depends on such items as time when granted, whether the copyright holder is an individual or a corporation, and so on. For individuals, generally the term of the copyright is the life of the author, plus 70 years.

Rights of the copyright holder include the right to reproduce the work, prepare derivative works, and distribute copies. In 1990, a provision was added to the Copyright Act on “moral rights” of the copyright holder, bringing the United States more in line with international copyright laws. Such moral rights include the right to claim authorship and the right to prevent intentional distortion and mutilation.

In spite of the rights of copyright holders, there are certain defenses to copyright infringements. Defenses include independent creation and, in certain situations, compulsory licensing on payment of royalties. It has been suggested that there might be a public need-to-know defense based on the First Amendment in such areas of news photographs or videotapes (Merges, Menell, & Lemley, 2009).

An often-used defense in copyright infringement suits is the fair use doctrine. This doctrine allows

for the “fair use” of copyrighted works for certain purposes, such as news reporting, scholarship, and teaching. In determining whether the use is fair, the courts look at the purpose and character of the use (e.g., nonprofit or not), the nature of the copyrighted work (e.g., unpublished or published, or workbook), amount and substantiality taken, and most important in the eyes of the law, the impact on the market for the copyrighted work. A good discussion of how these factors interact occurs in *Harper and Row Publishers, Inc. v. Nation Enterprises*, 471 U.S. 539 (1969), involving President Gerald Ford’s memoirs.

Somewhat analogous to copyright law is the law regarding trade and service marks. This is covered in the Lanham Act (1946, 15 U.S.C. §1051ff.). Among the differences between copyright and trade or service marks is that copyright protects expression whereas trade and service marks protect goodwill and reputation (Gower, 2003, pp. 96–100).

New technologies make copyright infringement easier to accomplish and harder to enforce. Various encryption systems were established to thwart unauthorized infringements and laws have been put in place to punish circumvention of such encryption devices, but infringements continue.

Knowledge of copyright law is important to public relations practitioners both in protecting their own creative product and in making sure that they don’t infringe on the rights of others.

CORPORATE BRANDING

Corporate branding (sometimes referred to as corporate marketing) is defined as the application of typical branding constructs found in marketing to the entire organization, that is, the organization itself becomes the brand—the corporate brand. It has also been defined as the process of creating and maintaining a favorable reputation of the organization and its various components, by sending signals to stakeholders using the corporate brand.

Corporate branding recognizes the full range of organizational stakeholders and their expectations and influence; thus, it can be argued that corporate branding, while not another term for public relations, certainly encompasses the basic elements of the practice. It does not focus on customers, but rather multiple stakeholders, and one of its key attributes is building relationships with those stakeholders. It is in order to say that public relations is the management function that has primary responsibility for the corporate brand.

“Corporate” in corporate branding refers to the Latin *corpus*, meaning the body, and corresponds to the definition of an organization; a group of individuals who come together to meet a need or to pursue collective goals. Corporate branding therefore is applicable to any type of organization, such as nonprofit organizations, political parties, football clubs, and so on.

Corporate Branding: A Multidisciplinary Construct

The roots of corporate branding are acknowledged as based in marketing. However an increasing need for organizations to differentiate themselves on more than products, coupled with the growing number of communication channels, many of which are out of the control of the organization, have provided impetus for organizations to move from positioning products to positioning their entire enterprise toward not only consumers but all

stakeholders. The study of corporate branding has thus resulted in a viewpoint that it must move beyond the influence of marketing models and their emphasis on consumers. This is represented by corporate branding becoming a cross-disciplinary construct benefiting from several academic disciplines, including marketing, strategy, organizational theory, visual identity, and communication.

Viewed as a method for organizations to differentiate themselves by revealing the organization behind products, corporate branding is closely associated with a concept from organizational theory—organizational identity. Organizational identity provides the basis of defining what the corporate brand is by answering the questions of what is central, distinctive, and enduring about an organization. Thus, a corporate brand is composed of those unique attributes that differentiate one organization from another. The old paradigm of “you are what you sell” has been replaced with “you sell what you are.” This includes the organization’s heritage, assets and capabilities, people, values and priorities, its local or global frame of reference, citizenship programs, and performance record.

“Selling what you are” is captured in corporate identity—how organizations describe who and what they are. Corporate identity is how the communication discipline is captured in most literature on corporate branding and has been explained as the projection of organizational identity (the collection of attributes that members use to describe an organization) to primarily external stakeholders. This is done through the organization’s behavior, symbols (visual identity discipline), and communication. Communication in this context may be oral or visual, controlled, uncontrolled (as when employees communicate with stakeholders), and indirect, for example, media coverage. There is no doubt that the literature is describing the practice of public relations. However, it is very rare that corporate branding is explored to any great degree by public relations researchers or textbook authors.

By influencing overall evaluations of the firm, the corporate brand thus becomes a powerful stimulus for overall positive associations. Because managers often want to focus on organizational attributes that they view as the most important, the public relations function may end up projecting or communicating an intended image of the organization or the associations that the organization

wants the stakeholder group to have of the organization. This is sometimes referred to as the communicated identity and it is not always in sync with the actual identity. The fear of manipulation through communicating a desirable and not a real identity, resulting in false or inaccurate images, is a point of discussion within public relations. Because of the nature of corporate branding and the rise of multiple communication channels, many of which are out of control of the communication staff, this strategy is not sustainable. It is therefore imperative that vision, culture, and image are linked. This demands a multifunctional approach where all functions participate, including marketing, strategy, human resources, design, and communication.

Some examples of descriptions used by organizations to different stakeholders include the following: to employees: we are a good, safe place to work; to customers: we stand behind our products and services; to society: we are a good corporate citizen; to investors: our reports and forecasts are reliable; to insurers: we are a sensible risk; to government: because of our economic and social contribution, support us; and to regulators: trust our interpretation of and compliance with the law.

Corporate Branding Tactics

Almost all of the tactics used in corporate branding are found in public relations, including community outreach, corporate advertising, corporate social responsibility (CSR) communication, and certain types of sponsorship. Corporate advertising, paid-for messages placed by the organization telling about the organization, consists of image advertising and advocacy or issues advertising. Examples are general image or positioning ads that announce plant openings, mergers and acquisitions, and innovations, to name a few. Recruitment ads may fall into this category, such as advertising in student newspapers and supporting different events at schools. Similarly, advertising toward the financial sector is a way to release information on financial results or to generate investment.

With advocacy advertising, organizations can communicate their position on topical issues that may or may not be connected with their business activities. This may include taking a position on social or business issues, resolving misunderstandings or countering a negative editorial. Dove

injects social issues into its product advertising by letting consumers know that the firm promotes healthy body images. Shell and its Profits and Principles campaign is likely one of the largest campaigns of this type. The company would like consumers and other groups to believe that the company does its utmost to protect the environment, work with local populations, and have an open dialogue with its stakeholders. Ford and Rolex give out to individuals for personal excellence, respectively, the Heroes for the Planet award and the Spirit of Enterprise, either for environmental work or helping humankind. The companies then advertise in major international media about the granting of these awards featuring the recipients. This type of communication is also called CSR communication, a way to brand the organization as socially responsible. It communicates to stakeholders what the firm is doing that makes it unique and distinct in its social initiatives.

CSR communication might also include statements regarding value chain decisions, environmental compliance, women and minority issues, investment guidelines, support of local community, and so on. Other types of activities are sales promotion, such as purchase-triggered donations, which associate the organization's name with a good cause, such as the Red Cross or Save the Children. There is a large list of companies that are involved in causes or support nonprofit organizations based on their corporate social responsibility.

These types of associations generally receive a lot of scrutiny and many consumers are skeptical of them. Therefore, organizations (on both sides) must be careful when entering into these alliances. Companies must be extremely careful that they "walk the talk," as a legitimacy gap in this area can be disastrous for a noncommittal firm.

There is every reason to believe that corporate branding will be more and more on the agenda of public relations researchers as they catch up with the practitioner community. Public relations is all about helping organizations communicate with their stakeholders in order to help the organization meet its goals. Clearly, the public relations or communication function's main responsibility is taking care of the corporate brand. This requires a deeper understanding of organizational theory

and behavior, topics that are not always on the curriculum of many public relations education programs.

CORPORATE MORAL CONSCIENCE

Public relations is sometimes considered the "corporate conscience" because it helps others in management to know and give proper consideration of the concerns and interests of an organization's various publics. As part of their decision making, organizations need to be cognizant of their publics' concerns in order to provide equitable and just decisions. Including the concerns of publics in decisions is inherently ethical because ethical behavior can be determined by consequences on others. Public relations practitioners question the ethicality of decisions by asking the question, "How will our publics see this decision?" The public relations practitioner then acts as a counselor on how the decision and actions may affect the publics concerned, as well as the organization or client.

A conscience should guide behavior along accepted moral principles. Basic to the development of public relations in the 20th century, professionals and academicians attempted to position the practice as an integral part of the moral, social, or ethical conscience of organizations. Practitioners counseled organizations to be more transparent

and operate in ways that benefit society. Nevertheless, others have questioned whether public relations really plays or should play this role.

What Is a Conscience?

According to Sissela Bok (1999), the conscience “is seen as another, and more exacting, self” (p. 94). Bok advised those confronted with dilemmas to engage in a dialogue with their consciences. A conscience should provide guidance regarding what is best. However, defining what is best is the difficult part of ethics: Best could be defined through moral principles (duty and obligation), or best can be determined by desired consequences. Regardless of which paradigm is used, moral decisions should be justifiable to those affected by them.

Ethical decisions involve making choices concerning competing loyalties or values. The right decision should be influenced by moral principles so that they are explicable to affected parties and defensible from a rational perspective. Ethical decisions usually affect others and impact the quality of relationships between the decision makers and those affected by the decision, as argued by Shannon A. Bowen, Brad Rawlins, and Thomas Martin (2010). Because a primary function of public relations is to maintain relationships with strategic publics, public relations professionals should be concerned about the impact of organizational decisions on such relationships.

Historical Foundations of the Corporate Conscience Function

Ivy Lee was the first to develop a statement of principles, published in 1906, that was based on the idea of truthful communication. It encouraged transparency and mediation between corporate behavior and public expectations. Increasing public understanding became the bedrock of his counsel.

Arthur W. Page, named the first corporate vice president of public relations in 1927, endorsed telling the truth, listening to stakeholders, and matching action to talk. Page demanded the vice president position at AT&T, so he could be in a position to influence corporate policy. He believed that the impact of public relations was peripheral if limited to the spokesperson role. Page’s impact was in being an active voice in policy and action that

promoted integrity. His principle, “tell the truth,” meant to be truthful in all situations and to all publics: customers, employees, client, and boss.

John W. Hill was a pioneer in the idea of public relations acting as corporate conscience. Hill (1958) argued, “Good public relations has been called the corporate conscience—an indispensable attribute of modern and progressive business” (p. 173). He maintained that a corporation has a duty of acting with goodwill toward its publics; therefore, practitioners must counsel objectively toward that end. Hill advocated integrity, sound management policies regarding employees and consumers, and disclosure in the public interest. Hill argued that facts should drive public relations, not the other way around, and that people must know what a company is doing to approve of its actions. Hill believed that public relations could serve as a corporate conscience by helping establish policy that is ethical.

Why Public Relations Should Act as the Corporate Conscience

Scholars have called for public relations officers to act as the ethical consciences of their organizations. Although this role is often delegated to other organizational functions, such as legal, financial, or human relations, public relations can offer insight into the ethical decision-making process that other functions cannot. In fact, the following reasons suggest why public relations practitioners are those best suited in the organization to act as the corporate conscience.

Public and Defensible Decisions

Ethical decisions affect others, and as such, should be made public to those affected. John Rawls (1999) asserted that a moral decision, in order to be justifiable, must be able to be discussed and defended publicly. Rawls explained, “The point of the publicity condition is to have the parties evaluate conceptions of justice as publicly acknowledged and fully effective moral constitutions of social life” (p. 115). Steven Phelps Wall (1996) summarized this position by saying “citizens are owed an honest, publicly accessible justification” (p. 502).

Rawls argued that such justification begins with public discussion by those involved in the decision.

Public relations should be involved in facilitating the dialogue between management and stakeholders so that options for mutual gain can be discovered. The best situation is that in which public relations is used to design a mutually beneficial solution with publics and then presents that resolution to the public as required in Rawls's test of morality.

Obligation of Dialogue

Philosophers agreed that dialogue can enhance the ethics of communication because it reinforces the dignity and respect of both parties. Ron Pearson (1989) based his public relations ethics on the dialogical philosophy of Jürgen Habermas who emphasized the crucial function of dialogue in the public sphere as the means for discovering truth. Other communication scholars have equated ethics with dialogical public relations. James E. Grunig and Larissa A. Grunig (1996) included the obligation of dialogue as the rationale for symmetry as a way of satisfying that obligation. Robert van Es and Tiemo Meijlink (2000) argued that symmetrical communication is the "core concept" of dialogue (p. 69).

When not founded on moral principles, dialogue can lead to moral compromise and unethical decisions. In the symmetrical model of public relations, dialogue is used "to bring about symbiotic changes in the ideas, attitudes, and behaviors of both their organizations and publics" (J. E. Grunig, 2000, p. 12). If the changes enhance and protect the rights of publics, the result can improve ethical behavior. However, an organization could be pressured by some publics to act in a way that harms or violates the rights of others. Amanda Cancel, Michael Mitrook, and Glen Cameron (1999) raised the question of how an organization should deal with morally repugnant publics, particularly when it starts from a position based on morally defensible principles. For example, the civil rights movement illustrates that some decisions, while not popular, are ethical. Public acceptance is not a prerequisite for ethical behavior. Practitioners act as an ethical conscience when they seek principled options to decisions by consulting with key publics and weighing the merits of each interest. Kevin L. Stoker and Kati A. Tusinski (2006) argued that information exchange can lead to the recognition and reconciliation of differences so that an ethical outcome does not suffer moral compromise.

Shaping Values, Culture, and Behavior Through Communication

Public relations is the primary communication function in an organization, internally and externally. This means that public relations can be instrumental in shaping the values, culture, and behavior of an organization. The values of an organization are often expressed in a mission statement, ethics statement, or credo. Public relations practitioners often help to construct these documents as well as enact their tenets in organizational decision making.

Public relations practitioners can be instrumental in fostering an organizational culture that is sensitive to ethical concerns. Shaping the organizational values and culture to include ethically conscientious behavior and regular consideration of the moral implications of decisions can result in more responsible organizational behavior.

More Enduring Decisions Through a Systems Theory Approach

Public relations is uniquely situated to discover, learn, and understand the views of publics. In systems theory terms, public relations acts as a boundary spanner, collecting information from publics in the environment of the organization and using that information in organizational decision making. Acting as a boundary spanner between the organization and publics allows the public relations practitioner to form long-term relationships with publics and incorporate their views into decision making. This means that publics should be more satisfied with an organization that incorporates their ideas and values into its decision making.

Practitioners can enact a dual membership role in the organization and in groups in its environment. The practitioner works to educate each side on the views of the other, while learning the values and ideals of each. Two-way communication is essential because it allows communicators to gain knowledge of an issue from a perspective outside the organization and to incorporate that knowledge into decision making. Understanding the values and legitimate concerns of publics allows the practitioner to act as a moral conscience because it is considering the impact of the decisions on the affected publics.

Listening to publics' needs and concerns and responding to them is often overlooked but are

important functions of public relations when acting as the corporate conscience. When the views of publics are considered in decision making, those publics are respected by the organization, which furthers the relationship. These types of decisions are more enduring over the long term because publics build trust in the organization and see that their ideas can influence organizational policy. When the views of publics are not taken into consideration, the issue is often reopened to debate. Public relations practitioners who act as the corporate conscience and incorporate the values of publics into organizational policy can save the organization resources by resolving matters effectively.

Impediments to Acting as the Corporate Conscience

Even though “public relations professionals seem to be uniquely qualified and situated to gather data and to supply leadership and expertise that can help corporations develop effective and useful ethical standards,” they may not be playing that role (Heath & Ryan, 1989, p. 34). In a 2006 study by Shannon A. Bowen and colleagues, 29.8% of a worldwide sample of public relations practitioners reported that they were in the dominant coalition or reported directly to the CEO. Many of those discussed advising on ethical dilemmas on a regular basis. However, about 70% of that sample of 1,827 practitioners said they had little or no training in ethics. Ethics officers were more likely to be lawyers, human resource managers, or finance managers.

Bowen (2008) found that some practitioners were reluctant to fill the corporate conscience role. Their reasons included a dependency on legal rather than ethical guidelines, a lack of ethical training, limited access to the dominant coalition, and a general discomfort for moral arguments. According to research, each of these hurdles can be overcome. Earning inclusion in the dominant coalition to advise on issues, learning methods of moral reasoning, and understanding social responsibility to the community allow practitioners to effectively argue for the role of corporate conscience.

Public Relations as Corporate Conscience

The ever-growing mandate for corporate accountability and ethical responsibility illustrates that more ethical deliberation is needed in corporate

decision making. The public demand for corporate transparency beckons communication through public relations, so the time is ripe for public relations practitioners to enact the corporate conscience role. Even with this demand, much work remains to be done before practitioners are regularly sought after as a corporate conscience and commonly prepared to enact that role. Although public relations is ideally situated to act as the corporate conscience for the reasons outlined above, it often abdicates that position to other departments.

As research shows, public relations practitioners are generally seen as a corporate conscience late in their careers. More training in ethics is needed in public relations before the majority of practitioners feel adequately equipped to advise on ethical dilemmas, even at the midlevel of the organization. Several factors, such as age and reporting relationships, play a role in the practitioner’s ability to function as the corporate conscience. Ethical sensitivity, or the ability to recognize the moral or ethical implications of a situation, also plays a role, as does prior practitioner training in ethics. Despite the difficulties associated with being able to function as the corporate conscience, public relations practitioners are filling this role at forward-thinking organizations, and the demand for ethical analysis conjoint with legal analysis is growing.

Cornelius B. Pratt (1991) confirmed that corporate ethics initiatives are “contingent on public relations practitioners who, as the consciences of their organizations, play an important role in ethical leadership” (p. 231). Ethical obligation demands that practitioners step forward to act as the corporate conscience. If they do not meet this challenge, ethical analysis is likely to lack the views of key publics or be limited to the legal or financial imperatives rather than moral ones, costing organizations losses of credibility and resources. By acting as the ethical conscience of an organization, public relations improves the responsiveness of organizations to their publics and helps contribute to the positive social role of business in society.

CORPORATE SOCIAL RESPONSIBILITY

The relationship between business and society is described through a variety of ways, such as corporate citizenship, but corporate social responsibility (CSR) remains among the most widespread concepts in politics, business, and academia. The notion primarily concerns how corporations should behave by factoring in concerns other than

profit-making. This entry first presents a brief historical overview before discussing various definitions of the concept and then the criticisms of same. The entry ends with a brief discussion of the role public relations can play.

Historical Development

That business should give back to society is a notion probably as old as the institution itself. The patronage activities of trade dynasties in Europe, such as the Medici, are often mentioned as a key early example. Originating in the Italian Renaissance, the Medici supported artists like Michelangelo and scientists like Galileo Galilei out of a genuine interest in the arts and sciences. While this type of patronage is discussed as a form of philanthropy, it is also recognized that the Medici used this strategic instrument to solidify and increase their power and improve their reputation.

Concern for the welfare of workers is another key theme that runs through history. In the 18th century, for instance, some European mining companies provided free medical care, pension schemes, and paid sick leave to their workers. The management style in smaller companies could often be described as patriarchal: the manager was seen to act as a father figure for the workers, shielding them from the workings of the free market system. At the societal level, protection and assistance from above was offered as reward for the humble loyalty of those from the lower rungs of society.

During the later industrial period, so-called company towns were founded both in Europe and the United States. There are examples of companies assuming financial responsibility for the construction and maintenance of the city church, bridges, roads, schools, even houses for the parish clerk and for the poor. This engagement could be motivated in part by a basic need to establish infrastructure where previously none had existed, or it could be based on paternalistic or political motives. In the United Kingdom, for instance, several such company towns were built to promote certain moral values but also to improve the working conditions for the employees. A healthy worker could be an effective worker. Some social welfare measures were also introduced in an effort to staunch the radicalization of the working class during the democratic revolutions that were spreading across the European continent.

The patronage activity of the business dynasties in Europe and the feudal tradition of *noblesse oblige* both find parallels in the U.S. philanthropy developed toward the end of the 19th century. In his essay titled *The Gospel of Wealth* (1889), business magnate Andrew Carnegie argued in favor of an obligation to help others after having satisfied the needs of oneself and one's family. The most well-known quote attributed to him reads: "The man who dies thus rich dies disgraced" (Carnegie, 1889, p. 665).

Some scholars nevertheless see philanthropic activities as a type of legitimizing strategy to be used in the wake of criticism or to circumvent any widespread assessments of business practices. A new form of critical journalism emerged in the United States, which focused on antisocial behavior, poor working conditions, and little consumer protection. Charity and philanthropy were the strategic response to such negative attention, as big businesses wanted to come across as a "good neighbor." During the 1920s and 1930s, this strategy on the part of U.S. business was implemented on a much larger scale and to greater effect than had been the efforts of individual business magnates during the previous century. The strategy succeeded in the sense that business was able to remove regulations and centralize industry despite heavy criticism of monopolistic tendencies, environmental damage, and wage slavery. European companies during the same period were often smaller as compared to their American counterparts, and the state and Church often succeeded in forcing them to look beyond the immediate goal of profit-making. When the modern European social welfare systems began to take shape in the 1920s, discussion surrounding the role of business in society fell out of the public sphere.

During the 1950s, business interests in the United States became so large and so powerful that their relationship with society was an increasingly common point of discussion. The contemporary publication mentioned most often was and remains *Social Responsibility of the Businessman*, by Howard R. Bowen (1953). Bowen argued that business should see beyond profit and loss and take on a responsibility in a wider sphere, consistent with the goal and values of society. What he called the doctrine of social responsibility implied that, if business took on this responsibility voluntarily, many of society's problems could be solved.

During the 1960s and 1970s, the concept of CSR gained a foothold in U.S. business. Again, this was mainly a reaction to criticisms leveled at business. Development was different in Europe, in part because the states played a larger role through welfare systems, and because they enforced stricter regulations. Nevertheless, discussion of CSR resurfaced in Europe during the 1980s and 1990s, due in part to the privatization of public enterprises occurring in several countries and in part due to the new wave of globalization. Many Western companies increased their activities abroad, often in new regions with democratic deficits, questionable human rights records, and widespread corruption. Companies also faced—and continue to face—increasingly daunting domestic challenges related to both the environment and corruption. Against this background, influential institutions, such as the United Nations and the European Union, moved to embrace CSR.

Definitions

Despite CSR having become a *lingua franca* of business and business politics, there is no dominant paradigm of CSR and no commonly agreed on definition. CSR can be defined narrowly as an obligation to pursue profits within the boundaries of society's rules and regulations. This is the minimalist definition advocated by free market liberals. A more common understanding sees CSR as a broad concept requiring that social and environmental concerns be factored into the equation, as well. Business must take into consideration—and seek to either avoid or rectify—the harmful effects of its activities beyond simply what the law requires. The latest definition put forth by the European Union, for instance, reads that CSR is the “responsibility of enterprises for their impacts on society” (European Commission, 2011, p. 6).

A classic definition proposed by Archie B. Carroll (1979) asserts that the “social responsibility of business encompasses the economic, legal, ethical, and discretionary expectations that society has of organizations at a given point in time” (p. 500). A company must meet its responsibilities in the economic sphere—that is, toward its shareholders, employees, and customers. In the legal sphere, it is required that the company conducts its business within the framework of the law. Furthermore, it is

expected that companies do and will behave ethically, and it is *desired* that they engage in discretionary and philanthropic activities.

Calling attention to social expectations is a reminder that business earns its “license to operate” from civil society and must act in accordance with accepted social norms in order to prosper and survive in the long term. This definition also situates CSR within a historical context: Business conduct that was previously tolerated can now be criticized in the media, thereby illustrating the social and historical contextual nature of such expectations.

Corporate social responsibility can also be seen as a business strategy that helps corporations negotiate their relationships with the wider society. The strategy can include mapping and evaluating the demands of stakeholders and the development and implementation of actions and policies to meet—or ignore—such demands. Following this view, CSR addresses how corporations might handle economic, social, or environmental issues. This type of definition points to the management of externalities that corporations undertake on behalf of their stakeholders, while also illustrating the flexibility of the CSR concept as it allows for descriptive analysis.

It has also been pointed out that the well-being of business is dependent on the well-being of society. “Doing well by doing good” is a popular maxim that builds on the so-called business argument for CSR. The latter proposes that CSR pays for itself by, for instance, improving the company's reputation. A good reputation can attract customers, improve and secure employee satisfaction, attract investors, and create a halo effect, which in turn generates positive media coverage and autonomy. The business argument, however, has been notoriously difficult to prove.

Criticisms

The first criticism of the CSR concept as such came from those adhering to the previously mentioned narrow definition. Doing something that would not be profitable would be detrimental to society's use of the profit-maximizing institution that is business. It would, furthermore, amount to stealing from business owners. If any charitable actions should be taken, it should be at the discretion of

the owners, not the CEO. Another argument relates to the different roles in society. Politicians are elected in part to address problems in society, while business leaders lack the legitimacy to decide on social goals.

Most research seems to conclude that corporations engage in CSR out of concern for their reputation. Corporate social responsibility is thus a business strategy and a form of *long-term* profit maximizing. This has opened business up to other accusations, chief among them the notion that CSR cannot be seen as moral action—it is just an economic strategy, no different from any other in its base motivation. In other words, the instrumental use of CSR is to be questioned. Corporations should behave—period. Aside from such arguments steeped in the thinking of duty ethics, CSR has also been criticized as being an attempt to put a human face on capitalism. It is a form of manipulation, meant to draw attention away from the fact that little is actually done for the public good as a result of the harmful practices of business. Corporations pose as responsible corporate citizens and claim to contribute to sustainable development since they *attempt* to reduce their carbon footprint.

Some critics point to how profit is and will always be the overarching motive of corporations, which leads them to seek to externalize costs wherever possible. Corporations have a very limited economics-based rationality and it is naïve to believe that they could liberate themselves from this rationale, as it is ingrained in the corporate capitalist system. In a scathingly critical book, *The Corporation: The Pathological Pursuit of Profit and Power*, Joel Bakan (2004) calls the corporation a pathological institution that follows its own interest regardless of the negative consequences thus created for others; so the argument is then that the market needs rules, regulations, and international standards to keep corporations in check. While there is a viewpoint that this argument works for the CSR-agenda, detractors believe that the public, the media, or nongovernmental organizations bringing pressure to bear on corporations is not sufficient. The problem is systemic.

Another type of criticism questions the business argument for CSR and the limits of the CSR agenda. It is not necessarily in an effort to see that the markets reward CSR-focused companies. To the contrary, there are a plethora of examples of highly

profitable businesses functioning with little if any attention paid to CSR and related issues. Some corporations slip under the public radar and thus have no economic incentive to engage in CSR, which is instead seen as a niche strategy—that it makes good business sense for some corporations, in some sectors, on some issues, under certain circumstances. Just as David Vogel (2005) argued in *The Market for Virtue*, the business case is overblown; it is only after a product has passed the price and quality hurdles that CSR might be important. This again underscores how the logic of the marketplace is insufficient in helping to create a sustainable society. If one corporation voluntarily reduced its carbon emissions, that corporation might incur additional costs that are not necessarily rewarded with increased market share. Collective action, in the form of cooperation among corporations, authorities, and nongovernmental organizations, is therefore called for with the goal of leveling the playing field and changing the practices of the sector as a whole. There are clearly reasons to simultaneously embrace and be skeptical about the CSR concept.

The Role of Public Relations

Public relations efforts are often accused of using CSR to set up storefronts for corporations in an attempt to “gussy up” their images. Ceding responsibility for CSR to public relations departments is seen as a hallmark of shallow practice. The very act of communicating about CSR is indeed suspicious, as corporations as a matter of course should concentrate on doing their business in a responsible manner. Flaunting CSR activities in image advertising is a form of embarrassing self-congratulatory rhetoric. Similar criticism goes hand-in-hand with some criticism of CSR motives. Casting CSR in moral terms is not morally proper, since CSR is based in self-interest and is a form of reputation exercise. At the same time, pragmatic reasons for caution can also be identified: One segment of the public is skeptical of CSR rhetoric, thus, corporations need to be careful when communicating about CSR. Attempting to hide the profit motive does not help improve a corporation’s reputation. The good news for corporations is that certain segments of the public also show some tolerance for the notion that corporations can attempt to do good and still want and be able to realize a profit

at the same time. What most public seem to find unacceptable or suspicious, however, is the one-sided presentation of CSR success stories as purely altruistic pursuits.

Accordingly, it is worth reminding that some form of communication about CSR is unavoidable. Silence on the matter of CSR is itself a type of communication signaling either corporate carelessness or a lack of sophistication in relating to stakeholders. If there is agreement with the premise that society is better off with the presence of business institutions, then this also allows for CSR communication of some type. For instance, CSR and CSR-related communication at least have the *potential* to help inform and constitute ethical business practices through stakeholder participation and issues management.

Corporations need public relations to communicate about CSR for a wide variety of reasons, not the least of which are the epistemological ones. Building on the notion of social constructionism, it becomes clear that all types of truth and knowledge build on some kind of human consensus, which in turn necessitates communication. A social constructivist perspective maintains that communication acts to construct and modify reality, social conditions, and relationships. When corporations want to establish truths about their CSR engagement, they need public relations. Scholars, for their part, might want to study how corporations go about constructing such truths, how CSR is defined and implemented, and how corporations use these constructions to achieve their organizational goals.

Corporations do not own the notion of CSR—it is an ever-changing social construct. Corporations also do well when they engage in stakeholder dialogue and regular mapping of their environment to keep abreast of changes. Dialogue focused on CSR must involve multiple stakeholders and the expectations expressed must be met constructively. It is simultaneously worth bearing in mind that friction and disagreement can be productive, but also that the dialogue form cannot rule out power difference and conflicts of interests.

Transparency on CSR issues builds a relationship of trust. Public relations can assist in this endeavor by using examples and hard facts about inputs and outcomes, presentation of motives, successes and failures, as well as testimony from credible third parties. This rhetoric can be used in a

media mixture of reports, Web-based tools, media relations and nonboastful image advertising.

Communication also has the power to constitute organizing practices, and thus aspirational talk might have a positive role to play in bringing about social change. It has been argued, primarily by Lars Thøger Christensen and Langer (2009) that leaders should be allowed to *talk the walk*, thus leaving room for hypocrisy in the sense that CSR communication must stay slightly ahead of other types of CSR action. This position, however, requires empirical research. For instance, the clothing industry has paid lip service to CSR for years; the issue of living wages nevertheless remains very much a concern. In the end there are some specific material problems created by business activities that must be resolved. Public relations efforts have the potential to assist in the pursuit of this goal, but also are easily used to manipulate, which is counterproductive to the betterment of society.

CORPORATE SPEECH

According to legal scholars, such as Yale's Thomas Emerson (1963), at the core of a self-governing system's freedom of expression is a set of rights assured to individual members of society, which includes the right to form and hold beliefs and opinions on any subject, the right to communicate ideas, opinions, and information through any medium, and the right to remain silent. Constitutional theorists, such as Alexander Meiklejohn (1961) advocate for the freedom of citizens to express themselves and participate in government.

The U.S. Supreme Court's extension of free speech rights to organized entities rests largely on the First Amendment recognition of the public's right to receive information relevant to the self-governing process. It follows that noncommercial, or political, speech by corporations enjoys greater protection than commercial speech, such as advertisements, because it seeks solely to benefit the corporation's interests. The argument for lesser protection for commercial speech is also based on a desire to protect consumers from fraudulent and unethical practices and perceptions that this type of speech has a lesser value than political speech in democratic decision making.

Tracing the legal history of corporate speech reveals the importance of the distinction between commercial and political speech, the difficulties in drawing the line between them, and the vigorous debates that have ensued. The U.S. Supreme Court's ruling in the 1942 case, *Valentine v. Chrestensen*, established the precedent that commercial

speech receives less protection than political speech. This restricted view was overturned in 1976 with the recognition that "some" purely commercial speech, if truthful and concerning a lawful product or service, should be protected in the interest of the free flow of information, in the seminal case *Virginia State Board of Pharmacy v. Virginia Citizens Consumer Council* involving abortion advertising. A defining case in the regulation of commercial speech was the 1980 *Central Hudson Gas & Electric Corp. v. Public Services Commission*, which set up the four-part test for determining whether restrictions on commercial speech are constitutional. The case struck down a ban on electric utility advertising based on considerations of these questions:

1. Is the speech protected by the First Amendment, meaning is it truthful, nonmisleading, and concerning a lawful product or activity? (If yes, the court proceeds with the other prongs of the test; if no, the test ends and the speech can be regulated or banned altogether.)
2. Is there a substantial governmental interest in restricting the speech?
3. Is the governmental interest directly advanced by the regulation?
4. Is there a reasonable fit between the governmental interest and the regulation?

The test has been applied and reinforced in more recent cases to reject bans in liquor, casino, and tobacco ads.

When corporations began seeking the right to make political and social statements, the legal opinion prevailed that such statements were permissible only if the public issue materially affected the business interests of the corporation. As early as 1961, when an organization of railroad presidents conducted a publicity campaign advocating adoption and retention of laws regulating the trucking industry, the U.S. Supreme Court recognized the right of citizens to inform their government representatives of their desires about passage or enforcement of laws affecting business. The Court's decision in the 1978 landmark case *First National Bank of Boston v. Bellotti* rejected this restricted view of corporate freedom of expression and established the contribution of

corporate public discourse to the self-governing process as the primary determinant of corporations' rights to freedom of expression. As expressed in the ruling, this type of speech is "indispensable to decision-making in a democracy, and this is no less true because the speech comes from a corporation rather than an individual." When two years later a privately held utility company was prevented from distributing a pronuclear power insert in its billing envelopes, the Supreme Court ruled in *Consolidated Edison Company of New York v. Public Service Commission of New York* that this violated the First Amendment and established the precedent that the state cannot confine corporate speech to specific issues absent a compelling state interest, using the three-part strict scrutiny justifications for limiting speech: (1) "a reasonable time, place, or manner; (2) a permissible subject-matter regulation; or (3) a narrowly tailored means of serving a compelling state interest."

During the 1970s, the question of whether corporate financial involvement in political activities should be limited was debated. Corporate limits, set by the Federal Election Act of 1971, on political campaign contributions were expanded and candidate contribution limits were upheld in the 1976 case *Buckley v. Valeo*. Questions of whether these political contributions may be made from corporate treasury funds or monies segregated solely for political use, and whether there should be distinctions between profit and not-for-profit organizations, evoked considerable controversy. The Supreme Court ruled that the use of compulsory union dues impinges on employees' rights not to speak. Corporate speech boundaries were again tested in 1986 when a lawsuit challenged a nonprofit corporation for using its general treasury funds to prepare and distribute a special election edition of its newsletter. According to the court, the statute that required this expenditure be made from a political action committee (PAC) did not apply to the nonprofit organization, because that organization's purpose was more similar to voluntary political associations than to business firms. The distinctions between for-profit and not-for-profit corporate free speech were more finely drawn in the 1990 case *Austin v. Michigan Chamber of Commerce*. Using the three-part strict scrutiny test, the Supreme Court ruled that because the Chamber was primarily a business

association, and not a political advocacy organization, the state did have a compelling interest to protect dissenting small businessmen and shareholders and to prohibit the use of corporate funds for advocacy of a candidate.

More recently, two cases have changed the legal boundaries of commercial and political speech. Nike argued that a public relations campaign to improve the athletic equipment manufacturer's image in the early 1990s was political speech; however, it was ruled to be commercial speech because it was directed to consumers. This decision reduces the scope of corporate political speech and shifts the focus from the public's right to information to the speaker's right to expression. Finally, the 2012 presidential election was the first since the 2010 *Citizens United v. Federal Election Commission* ruling that gives corporations the same political speech freedom that people enjoy. The decision overturned a decades-long ban on corporate money in federal elections, and commentators expect it to reshape the way elections are conducted and to have other major political and practical consequences.

COUNSELING

Counseling, the *crème de la crème* function of the public relations profession, occurs when senior practitioners give advice to the senior members of an organization. This is often not an easy or enviable position. Advice can help define and redirect the future of an organization as well as refine its communication programs, functions, strategies, and tactics.

In essence, this kind of advice is intended to build, maintain, or repair a favorable relationship between the organization and one or more markets or publics—its stakeholders. If proper, the advice addresses problems that might strain the relationship and increase the quality of strategic relations; but it is important to note that this advice may lead to dramatic or subtle changes on the part of the organization to make it more capable of meeting stakeholder expectations. This public relations counsel can focus on increased standards of corporate responsibility or better ways to achieve those standards. It addresses standards of ethics and helps the management of the organization recognize what it needs to produce a good organization so that it can act with character, legitimacy, and authority.

The advice may focus on what the organization needs to do as well as how to perform that objective. The persons receiving the counsel seek to better understand and respond to some challenge. Counseling by its nature requires experience and tends to be dysfunctional if it only confirms management's preferences. It is best when it brings to bear sound judgment that draws on best practices as well as sage ethical advice. Through years of experience, counselors acquire insights needed to offer such advice. Advice is often based on astute insights into case studies—both successful and unsuccessful. Insights grow because of constant attention to best practices and scrupulous reading of essays and books reporting on relevant public relations research.

Counseling can occur reactively and proactively. In the first case, a management team may call on the advice of a senior practitioner after some problem has reached the boiling point. Slowly, the relationship between an organization and one or more publics has deteriorated. Other counseling expertise was used to solve the problem, but the advice failed to solve the problem. Perhaps, someone thinks, the problem may be a “PR problem”—whatever that means; he or she may unfortunately think that one or two well-crafted messages and perhaps a slick slogan, clever pamphlet, or expeditious Web/social media posting can set the matter right. Often these “Band-Aid” strategies fail because the problem is due to something other than ineffective communication. Counseling is least useful when it focuses only on communication solutions.

Proactive counseling is employed to head off a problem before it starts or before it reaches the boiling point. For instance, a substantial amount of discussion occurred in the 1970s regarding the ability of public relations practitioners to use issue monitoring and other issue management techniques to spot and respond to an array of emerging issues. Experts often thought that if an emerging issue was addressed early enough, the messages the organization disseminated could allay the strain. In some cases, studies eventually found that the strain was not due to an emerging issue that can be “communicated away.” However, thinking about, planning for, and responding in an open and constructive way may lead to a proactive, collaborative decision before combatants become recalcitrant and the problem and solution become ego driven. In this sense, public relations counsel can be conceptualized as a key component of change management.

One of the other types of counsel that is sought in various situations is the advice of attorneys—thus, the concept of legal counsel. Lawyers are often trained to advise clients to respond in different ways than public relations practitioners suggest. Lawyers focus on the status of law and the extent to which some entity might successfully bear the burden of proof in litigation against the organization. This kind of advice might also be inadequate because the problem may arise not because of a difference of legal interpretation, but due to differences in facts, the interpretation of facts, value conflicts, or preferred policies.

These latter aspects of marketing and public policy are squarely in the realm of senior public relations practitioners. Often called on to solve or prevent problems, they may in fact bring problems to the attention of senior management. If the senior practitioner is adequately serving the interest of his or her client or employer, he or she should be tuned into various relationships and watch for their dysfunction. Counselors need to be on guard for strains in the relationships or look for ways to strengthen them.

Counseling requires the ability to solve and prevent problems; the mark of their professional skill is their ability to offer sound and ethical strategic advice. As a senior practitioner once said,

A long time ago, I learned that when management needs advice most, you had better be ready to offer several solutions and be ready to defend each. Also, you better not raise a problem unless you think you have a sound solution. And, you must be ready to raise problems when you see them. And, you had better see them first. (personal communication, December 1992)

Some of the high-water points in the history of the public relations profession occurred when practitioners responded soundly to the need for counsel. Likewise, some of the lowest moments of the profession resulted from unsound advice. Some of the worst counsel crafted communication responses that led to manipulation and lying—and even what some might call the engineering of consent.

John W. Hill (cofounder of the public relations firm Hill & Knowlton) was keenly aware of the challenges of public relations counsel. It requires candor, honesty, and a perspective on how all parties benefit, not just the organization seeking counsel. He recommended the following philosophy:

The extent to which the public relations counsel influences policy depends on whether he can demonstrate capacity for giving sound, practical and objective advice on policy matters. If he can do so, there will be little question about this role in policy decisions. If the practitioner has something to offer, he is likely to get the opportunity. If he has no original or helpful ideas, he is not likely to get very far in policy deliberation. (Hill, 1963, p. 141)

As noted in this observation, Hill was one of many practitioners and academics who over the years challenged counselors to truly make a difference. Going beyond being clever, the challenge is to offer sound and enduring advice that holds up to the measure of time. Public relations can help advance or harm the legitimacy of the organization to operate.

As is true of all professions, public relations is best when it serves the mutual interests of clients or employers and their publics or markets. Conducted properly, counseling—the giving of advice—can distinguish the profession and demonstrate its value to society. Applied improperly, it leads to pejorative definitions of the term *public relations* as fouling rather than fostering the fully functioning society.

CREDIBILITY

Credibility can be defined as the perception or judgment made by message receivers about the believability of the message source and the truthfulness of the message. Source credibility emphasizes the importance of the message source on the impact of the communication process. Credibility, classically referred to as *ethos*, is a multidimensional construct that was defined and discussed by Aristotle in his treatise, *Rhetoric*. In his analysis on persuasion, Aristotle defined three elements that comprise a communicator's ability to persuade the audience: *ethos* refers to character and integrity of the source, *logos* refers to intelligence or reason, and *pathos* refers to emotions or charisma. Contemporary research confirms and is consistent with Aristotle's postulates. Expertise or competence and trustworthiness are the two source characteristics with the greatest impact on the perceived credibility of the message source.

Expertise or competence is based on the source ability to make correct claims and deliver logical information based on knowledge, experience, intelligence, qualification, authoritativeness, and professionalism. Trustworthiness is assessed based on the communicator's perceived ability to provide valid and truthful information, to be honest and sincere, but also to be dependable and reliable.

Other factors that affect credibility are goodwill or the communicator's benevolent intention toward the message recipients and communicator's attractiveness. Attractiveness, or physical appearance, is especially important in creating first impressions and thus plays a role in message acceptance.

Credibility is an important concept for the profession of public relations as the effectiveness of communication is directly influenced by the stakeholders' attitude toward the communicator. Attitude toward the message source affects the way stakeholders evaluate and accept the message, which determines the success of persuasion attempts to shape attitudes and behaviors of stakeholders.

Credibility is related to trust, which is an essential variable in organization–public relationships. A favorable organizational reputation contributes to initial credibility. Public relations professionals need to distinguish between credibility of the organization as a whole and a communicator's credibility, which often determines the selection of spokespersons when discussing specific matters.

New communication technologies and social media allow image and messages to be carefully selected and constructed; thus, online source credibility is becoming increasingly important in relationship building. Based on the assessed credibility of an organizational website, blog, or another channel, people decide whether to engage in relationships or not. Perceived credibility is influenced by the information seeker's motivation, goal (e.g., seeking entertainment, information, or business), experience, culture, knowledge, and skills. Information seekers assess the credibility of an online source based on multiple dimensions, such as gender, attractiveness, source identification and identity, ownership and sponsorship, theme, and purpose, among many other qualities that are viewed simultaneously.

CREDITS

Credits take a variety of forms across different media but always perform the same function: Attribution for both the people responsible for the content of a particular work and those responsible for the final form and distribution of the content.

When using the term *credits*, the public relations practitioner is usually talking about the texts shown at the end (and increasingly, also at the beginning) of television programs and theatrical films. If examined properly, credits can provide an additional wealth of information beyond the obvious listings, such as what actor played which character and so forth.

All jobs (or positions) listed in credits fall into two broad categories: above-the-line and below-the-line. Above-the-line positions include producers, directors, writers, and actors, while below-the-line positions are technical and production positions: Camera operators, sound recorders, editors, and positions in other hands-on areas where creative input is very narrowly focused.

In general, a producer secures financial backing for a project, from either studios or outside investors. Outside investors range from companies and individuals who finance films for a living (and, therefore, expect a positive financial return on their investment) to individuals providing funds simply because they “believe in” the project.

Producers also serve as liaisons between investors and the other above-the-line production members and can also be responsible for budgeting,

scheduling, and possibly the supervision of day-to-day production decisions.

In the case of documentaries and other potential “advocacy” productions, the credits usually include some sort of acknowledgments section. In the case of independent films (“small budget and no major studio backing for production”), there is usually a very large run of names that falls under the heading “Thanks.” The names usually included are individuals who donated time or services, low-dollar investors, and small contribution financial backers.

With the possible exception of radio dramas (which are almost extinct), credits for radio programs are always given at the end.

Irrespective of the format or media channel, it is important for content creators to list accurate credits. There is an ever-increasing reliance on the Internet and World Wide Web for the cataloging, storage, and retrieval of both old and new information.

The much more porous and granular nature of mass media has resulted in a greater importance placed on intellectual property and the protection (read: control) of its ownership. The proper use of credits makes it easier for proper attribution to be given when works are cited, permission for content use requested and for copyright holders to better defend against infringement.

CRISIS AND CRISIS MANAGEMENT

The study of crisis and crisis management is a vibrant field within public relations and beyond. There is a strong imperative for understanding crises and crisis management. All organizations should realize they are vulnerable to crises, so they must prepare for the eventuality. Once management realizes crises are possible or even probable, they need to grapple with what constitutes a crisis and crisis management.

A crisis can be defined as “the perception of an unpredictable event that threatens important expectations of stakeholders and can seriously impact an organization’s performance and generate negative outcomes” (Coombs, 2012, p. 2). This

definition is a synthesis of many definitions and presents five critical features. First, crises are largely perceptual. Stakeholder perceptions are a driving force in determining if any event is considered a crisis. If customers are online complaining that a product is harmful, this must be considered a crisis, even if management disagrees with the customers’ assessments.

Second, a crisis cannot be predicted but can be expected. Crisis managers know a crisis will hit but cannot say exactly when—a crisis is unpredictable. Third, a crisis violates stakeholder expectations about how organizations should behave. Fourth, a major threat has the potential to harm an organization’s performance. This does not mean the impact always occurs, just that the potential exists. Quick actions by a crisis management team can prevent the crisis from fulfilling its potential. Thierry Pauchant and Ian Mitroff (1992) called smaller problems “incidents.” Incidents are fairly easy to cope with and do not disrupt the organizational routine. Fifth, a crisis can create negative outcomes for an organization, the industry, and/or stakeholders. It can harm any or all three of these entities. Consider an explosion at a petroleum-processing facility that injures three employees. The employees suffered physical and psychological harm. The organization may be shut down for repairs and lose production time and revenue. The safety of the entire industry may come under scrutiny because of the publicity and investigation surrounding a high-profile accident. Nearby residents may have been evacuated after the explosion as a precaution against hazardous chemicals while customers may experience an increase in price as production levels drop.

A crisis extends over a period of time. Steven Fink (1986) described a four-step life cycle for a crisis: (1) prodromal, warning signs appear before a crisis hits; (2) crisis breakout or acute, the trigger event occurs or what we typically think of as the crisis happening; (3) chronic, the time it takes to attend to the damage and disruption from the crisis; and (4) resolution, there is evidence that the crisis is over and no longer a factor with stakeholders. Fink’s work helped people realize crisis management entails more than simply reacting to the crisis. Crisis management could proactively attempt to prevent crises.

Crisis management is “a set of factors designed to combat crises and lessen the actual damage

inflicted” (Coombs, 2012, p. 5). It often is mistakenly equated with having a crisis management plan. The goal is to lessen or even prevent any of the possible negative outcomes a crisis might generate. Crisis management entails a complex set of factors that unfold in four stages: prevention, preparation, response, and learning.

Crisis management begins with prevention or mitigation. Prevention tries to identify the various risks an organization faces. A risk is a potential threat that could escalate into a crisis. Risks include weather threats, worker error or violence, and technology failures. Prevention involves attempts to identify and to mitigate the risks. Identification involves locating potential sources of risk—the organization scans for risks that could manifest into a crisis. Due to social media, some crisis prevention now transpires in view of stakeholders. The term *paracrisis* denotes crisis prevention efforts that occur in public.

Mitigation tries to eliminate or reduce risks; some can be significantly reduced. For instance, an organization uses a hazardous chemical in its production process. The presence of the chemical presents the risk of a hazardous release. This risk is significantly reduced if the organization can find a nonhazardous chemical to replace the one it uses or change the processes to reduce the likelihood of release. Training and monitoring is used to reduce the risks that cannot be eliminated. Prevention and mitigation reinforce the need for crisis management.

Preparation means the organization is getting ready for a crisis because management realizes one might appear. Preparation is what many people in organizations think about when the term *crisis management* is used. The essential elements of preparation are a crisis management plan, a crisis management team, and practicing the crisis management plan. The crisis management plan is an outline for the organization to respond to the crisis. The value of the crisis management plan lies in the preassignment of responsibilities and precollection of critical information. Time is saved during a crisis when people already know their preappointed roles. Time is not lost deciding who should do what. Critical contact names (and how to reach them) were already collected, so time is not lost trying to find who and how to reach someone. One major element to a useful crisis management plan is not making it too detailed or complicated. Each

plan must be adapted as each crisis is unique and a plan cannot cover all contingencies. A crisis management plan includes members of the crisis management team and their contact information, key people or groups that may be useful during a crisis and their contact information, and forms to remind crisis team members the action format, such as logging and responding to outside inquiries about the crisis or documenting actions taken to address the crisis.

To develop a crisis management plan, corporation managers need to revisit their identification of risks. The managers need a crisis vulnerability analysis to determine which types of crises are most likely. Risk analysis indicates what crises are likely to emerge. The crisis management plan needs to fit the most likely crises and must be flexible, a living document. A crisis management plan should be revised at least once a year. During the course of a year, composition of the team may change, key contacts may change jobs, and crisis vulnerability may change.

The crisis management team is composed of those people who enact the crisis management plan and address the crisis. The crisis management team is cross-functional; it comprises people from different sectors of the organization. Each team should have the best mix of knowledge and skills for handling a crisis. Typical crisis team membership includes representatives from legal, operations, public relations, facilities management, and security. Legal expertise is required to ensure that the words and actions of the team do not increase the legal liabilities of the organization. Operations personnel know detailed information about the production process. Public relations personnel are skilled in media relations, are able to handle media inquiries, and can handle timely reporting. A crisis can raise questions about the structure or layout of a facility. Facilities management has the knowledge to answer these questions. Security personnel are often the first to learn of a crisis and to reach the crisis scene. Security also needs to coordinate its efforts with emergency responders, such as fire and medical teams.

Having a crisis management plan and team is pointless if the two never practice. The Federal Emergency Management Administration (FEMA) advocates practicing crisis management plans so that management is certain that there are no large discrepancies (e.g., important contacts were not included), there are no mistakes (e.g., wrong phone

number or radio frequency), and that crisis team members work together effectively. Crisis simulation tests the plan and team members. It is possible that some team members are not able to handle the stress of crisis management and need to be replaced. Regular practice helps new members of the team get up to speed and tests any modifications made to the crisis management plan. Practice is costly as participants must take a day or two away from their jobs to be part of the crisis management test. However, without testing, an organization does not know if it has a functional crisis management plan and/or a functional crisis management team.

Technology is influencing the preparation by organizations. Technology can be used to facilitate the work of the crisis team and becomes an important tool for monitoring the development of the crisis, knowing how stakeholders are reacting to the crisis, and evaluating the crisis management efforts. For instance, social media can be monitored for crisis threats and used as part of the crisis response. Crisis informatics is an emerging area of research that studies the intersection of crisis management and technology.

Response is the actual reaction once a crisis does hit. The response encompasses what the crisis management team says and does to handle the crisis. Preparation makes the response more effective, if the organization has practiced. The crisis management team faces physical and informational demands. The physical demands include addressing the damage from the crisis, including injured people in need of treatment, evacuating people at risk, containing and suppressing fires, reinforcing buildings that sustained structural damage, and salvaging equipment. The crisis management team coordinates its efforts with the business continuity team. The business continuity team is charged with keeping an organization functioning during a crisis or returning an organization to regular operation as soon as possible after the crisis. Business continuity teams might use alternate facilities, rental equipment, or temporary staff to help maintain an organization's ability to function. It is important that the crisis management and business continuity teams work in concert to prevent redundant actions or interference with one another.

When a crisis hits, an information vacuum is created. Stakeholders and members of the organization

want to know what happened and why. The crisis management team collects information to discover what happened, and, in turn, is responsible for collecting and disseminating information to various stakeholders. The crisis management team uses a standard list of topics to guide information collection: what happened, what was the cause, who was/might be affected, where it occurred, and how much damage and what kind of damage was sustained. This information is necessary to help make decisions about the physical response. For instance, a crisis team must know what is in a gas cloud created by an accident and where the gas cloud will travel before determining if an evacuation is necessary and who should be evacuated. Stakeholders will be contacting the organization requesting information. The news media, people living nearby the facility, suppliers, clients, and government officials all might contact the organization to get information about the crisis. Social media increases the potential that various stakeholders request information about a crisis. The crisis management plan helps to coordinate the collection and dissemination of crisis information.

Crisis management does not end when the crisis ends. Four key activities must transpire post-crisis: monitor and cooperate with investigations, update stakeholders, evaluate the crisis management effort, and healing. Many crises, such as airline accidents and chemical accidents, take time to investigate to determine their cause (Ray, 1999). The crisis team must help investigators, typically a government agency, and keep abreast of any findings. Reporting results of investigations is one of the points that is communicated to stakeholders in updates. Updates also include any other information the crisis team promised to deliver to the stakeholder during the crisis. For example, an explosion at a plastic manufacturing facility halts production at that site. The crisis team promises to inform employees and the community about the cause of the accident and any corrective measures that are taken. The crisis team informs customers when the facility is operational again. Once the investigation determines the cause of the accident, the crisis team can tell employees and community members why it occurred and what actions can be taken to prevent a repeat of the crisis. Once that has been determined, the crisis team can update customers as to when the facility will be operational.

Experts agree that a crisis should be a learning experience. Therefore, an organization must do all it can to learn from its own crisis experience. To learn from a crisis, the crisis management efforts must be carefully evaluated. The careful post-crisis analysis is called a postmortem. A postmortem is a systematic study of what the crisis management team did and the effectiveness of those actions—it assesses what was done well or poorly. Postmortems are stressful because people fear management is looking for a scapegoat. It is critical that postmortems are not a search for blame, but a search for information. Once evaluated, the crisis team is briefed on its performance. The team learns what it is doing right and what it should change for future crisis management efforts. The next crisis practice should focus on the learning points the team recorded. For instance, if there is a problem coordinating efforts with emergency responders, the next crisis practice should concentrate on the organization–emergency responder interface. The postmortem needs to be structured with a set group of criteria. Results of the postmortem will be better organized if the process is systematic. These are stored for future reference. Storing the postmortem information builds institutional memory about crisis management so that the knowledge can be referenced whenever needed.

Healing involves efforts to further aid stakeholders in coping psychologically with the crisis event. Stakeholders need to grieve over any loss and process the trauma that occurred in their lives. Physical memorials are one way to help grieving. Some organizations have created physical memorials for crisis victims. Online memorials are a common occurrence these days and are created for crisis events (Coombs, 2012). Organizations need to decide how they can facilitate stakeholder healing and what connections they might have to memorialization efforts.

The crisis management process is circular rather than linear. Learning can inform any of the other three stages. Lessons from the crisis may help in prevention (e.g., how to reduce some risks), preparation (e.g., how to improve the crisis management plan), or response (e.g., how better to deal with the news media).

New communication technology has reshaped the crisis management process. A crisis plan should be short but include how to find information that

could be critical in a crisis, such as the location, amount, and types of hazardous chemicals at a facility. The Intranet is a perfect supplemental source to the crisis management plan that crisis managers can access with mobile devices, such as smart phones. Volumes of information can be stored on the Intranet and quickly retrieved by the crisis team during a crisis. Instead of requesting information from another party, the crisis team can access information directly. Of course, this assumes the crisis team has access to the Intranet and that the Intranet remains functional during a crisis. Crisis management teaches the teams to have backups so there should be alternative means for finding the requisite information. Stakeholders expect organizations to integrate the Internet, including social media, into their crisis communication efforts. It is now common for organizations to have either a dedicated crisis website or sections of the organizational website for crisis information. Customers, suppliers, the news media, and community members can be updated quickly by posting information to the crisis website. Again, this assumes the crisis team can access the website during a crisis. This is a fairly safe assumption because crisis-prepared organizations use secure, remote locations to store servers. As a result, even if a facility is destroyed, an organization still has its Intranet and website that the crisis team can access remotely.

Crisis management is a complex process. To be effective, an organization must embrace the entire concept and not declare that it is crisis prepared simply by creating a crisis management plan and team. Crisis management is an ongoing process.

W. Timothy Coombs

CRISIS AND EMERGENCY RISK COMMUNICATION

Crisis and emergency risk communication (CERC) is a framework developed by the U.S. Centers for Disease Control and Prevention (CDC) in response to public health threats, including bioterrorism, that require health communicators to provide strategic, scientifically accurate, timely, and empowering messages to the public.

Health communicators employ risk communication to educate the public on health topics, including tobacco prevention, physical activity, and nutrition. Public education requires the development of risk messages that provide scientific and technical understanding of a specific risk factor, as well as cultural or social beliefs regarding the risk. These risk messages use persuasive appeals to encourage the public to take specific actions to change unhealthy behaviors. In contrast, crisis communicators communicate event-specific information that informs rather than persuades the public. Crisis messages address a specific, unexpected, and nonroutine organizationally based event or series of events, which creates high levels of uncertainty and threat or perceived threat to an organization's high-priority goals. Emergency communicators often create warning messages that alert the public to follow specific instructional

messages to mitigate harm (e.g., an emergency alert instructing the public to take shelter from a tornado).

CERC encompasses the urgency of disaster communication with the need to communicate risks and benefits to stakeholders and the public. CERC incorporates basic risk and health communication campaign tenets by identifying various communication needs of audiences and providing specific messages at various points in the ongoing development of an event.

CERC uses subject matter experts to craft messages that (1) provide scientifically accurate risk explanations and (2) provide the most accurate information to the public, empowering them to make the best possible decision given the uncertainty of the emergency context. Unlike risk communication that allows for a dialogue to occur over an extended period of time, crisis and emergency risk communication fundamentally requires communicators, health experts, and the public to make health decisions within a narrow time constraint with incomplete information; such decisions are often irreversible and their outcome is unknown.

The CERC framework assumes that public health emergencies systematically develop and continue through five distinct phases: preevent, initial, maintenance, recovery, and evaluation. These phases are similar to traditional models of crisis phases found in disaster sociology literature but with the addition of the evaluation phase, which is a critical component of traditional health campaigns.

The prescriptive nature of CERC provides communicators with the opportunity to prepare for and anticipate communication needs and potential problems. The model provides a comprehensive approach to communicating about health risks and empowering the public to take action to self-protect against potential health harms.

The first stage is precrisis, which focuses on monitoring the environment for health risks, developing networks with other government agencies and key stakeholders, developing guidelines and recommendations by health experts, and creating messages and other communication products. Public education and awareness of potential health risks is a critical component of the precrisis stage.

The second phase is the initial event, which requires the health agency to take some form of response action. The first 24 to 48 hours of a public

health emergency is a critical time for public information activities. Health agencies need to establish their authority and credibility by striving to be the first agency to provide information about the event. The first messages disseminated from the agency include empathetic statements by designated agency spokespeople, risk explanations, anticipated outcomes, and broad messages about the health emergency. The length and description of these messages are dependent on the scope and severity of the event. Additionally, the health agency explains what actions are being taken to investigate the public health event and find the source of the public health harm (e.g., using epidemiological investigations to find the source of foodborne illness or infectious disease outbreaks). Finally, the health agency disseminates self-efficacy messages that provide the public with simple, yet empowering actions they can take to protect themselves from harm.

The third stage is the maintenance phase, which can begin a few days into the event and lasts for weeks or months depending on the severity of the event. During this phase, health agencies receive additional information from key stakeholders and data inputs, such as results from laboratory testing or updates from the epidemiological investigation. These inputs inform communication strategy and message development. For example, reassurance messages highlight the response actions of the health agency and how the agency is finding the source of the outbreak. Other key messages include uncertainty reduction and self-efficacy messages. Uncertainty reduction occurs through providing additional health risk explanations and continued messaging on self-protective actions. It is also critical during the maintenance phase to develop a systematic process for monitoring media and gathering feedback from the public.

The next phase of the CERC model is recovery, and messaging focuses on public education and awareness about recovery efforts and returning to everyday public health activities. During the recovery phase, once the immediate health threat has subsided, and health agencies still have the attention of the media and the public, there is an opportunity to transition from emergency messages into preparedness messages (e.g., resupply medical emergency kits, update family disaster plans, advocate for seasonal influenza vaccinations).

The final stage of CERC is evaluating the effectiveness of crisis messages. Conducting a public survey, communicating with key media contacts, or analyzing public inquiries through hotlines or social media messages provide potential data points for analysis. Documenting the evaluation process and sharing the results with both health department leadership and preparedness program staff is essential to updating or refining any communication policies or procedures.

In October 2002 and based on a practiced driven need, the CDC launched CERC as an innovative training course to prepare public health officials for the threat of an influenza pandemic. The training course outlines communication concepts and provides practitioners with skills and tools needed to develop communication strategies, key messages, and other communication products to be used in the event of a health emergency.

CRISIS COMMUNICATION

Crisis communication is like the Indian parable about the blindfolded men trying to describe an

elephant. Each man describes only the part he feels, resulting in very different descriptions of the animal. Crisis communication is used in a variety of ways in crisis management. Depending on what article or book is read, a person can discover very different uses of the term. The Crisis Communication Array offers a useful way to organize our thinking about crisis communication. The Crisis Communication Array is a matrix composed of two categories of crisis communication and the three phases of a crisis (Coombs, 2010a).

The two categories of crisis communication are managing information and managing meanings. Managing information is composed of collecting, analyzing, and disseminating information. Crisis managers collect crisis information (raw data) and analyze it so it becomes knowledge. Dissemination involves sharing the knowledge with others. Managing meaning involves efforts to influence how people perceive the crisis—for instance by attributing its cause, the character of the organization involved in the crisis, and the quality of its response. Most crisis communication can be assigned to one of these two categories.

Crises are characterized as having phases. The basic three-phase view involves precrisis (prevention and planning), crisis response, and postcrisis (follow-up, learning, and healing). Both types of crisis communication can be found at each crisis stage. The Crisis Communication Array identifies six types of crisis communication: (1) precrisis managing information, (2) precrisis managing meaning, (3) crisis response managing information, (4) crisis response managing meaning, (5) postcrisis managing information, and (6) postcrisis managing meaning. These six types of crisis communication are meant to guide research but are imperfect categories for organizing crisis communication because some efforts blur the distinctions between information and meaning or between phases.

Precrisis managing information includes efforts to scan for threats, monitor crisis-related risks, craft crisis management plans (CMP), tell people about CMPs, and collect information that a crisis team might need during a crisis. The CMP helps to illustrate managing information. The CMP has sections devoted to crisis communication as information. The CMP has complete contact information for the crisis management team near the front of the document. The CMP also contains contact

information for people or groups who might have information that the team needs during the crisis.

Precrisis managing meaning involves convincing stakeholders to accept the need and value in crisis management, encouraging external stakeholders of a CMP's efficacy, and developing a sense of self-efficacy in stakeholders related to the enactment of the CMP. Encouraging external stakeholders about plan efficacy demonstrates managing meaning. Stakeholders, including employees, need to believe that a CMP works (keeps them safe) during a crisis or they will ignore the CMP. Convincing stakeholders of the CMP's efficacy is a function of managing meaning.

Crisis response managing information centers deal with the need to collect and to analyze crisis-related information. Creating crisis knowledge is essential to decision making by crisis management teams and effective warning/notification systems. The effectiveness of a warning system illustrates the importance of managing information during the response. The warning system is designed to protect stakeholders from hazards created by a crisis. Until information is known about the crisis, crisis managers do not know who to warn or what actions those in danger should take. For instance, weather and the types of chemicals released by an accident indicate what geographic location is at risk and if the stakeholders should evacuate the area or shelter-in-place.

Crisis response managing meaning is the most visible and researched area of crisis communication and includes reputation management and repair, meeting crisis communication expectations, and risk communication about the crisis. Reputation management serves as an excellent example of managing meaning during the crisis response. Reputation management in crisis involves efforts to lessen the negative stakeholder perceptions created by a crisis. Corporate apologia, impression management, image restoration theory, and situational crisis communication theory are all used to examine managing meaning through reputation management. Managing meaning during the response is critical because perceptions of the crisis and/or organization in crisis affect future interactions between the organization and its stakeholders. By changing how stakeholders feel about the crisis and/or organization in crisis, crisis managers can minimize the damage a crisis inflicts on the stakeholder–organization relationship.

Crisis experts agree about the crisis communication expectations. These expectations are tactical in nature but do influence how people perceive the organization in crisis and, therefore, are related to reputation management. The crisis team must have an initial response that is quick, consistent, open, and expresses sympathy for victims. Early in the crisis communication, the organization needs to provide instructing and adjusting information. Technology has increased the speed at which people communicate. The same holds true for crisis communication. Expectations are that an organization responds quickly, within one hour of the crisis event. Also, there are growing expectations that crisis teams use the Internet as one communication tool for the initial response by utilizing social media and posting information to a separate website or a special section of the organization's existing website.

Consistent means that an organization is providing a coordinated response that is free of contradictions. Two elements can undermine consistency. The first threat is error. The need for speed in a response can create mistakes about a factual statement. When the crisis team has to correct previous statements, the organizational response appears confused and inconsistent. The second threat results because of multiple spokespersons. The idea of only one person speaking for an organization during a crisis is a myth. As a crisis extends over time, one person cannot continue to speak for an organization day and night. Long crises demand multiple spokespersons. Also, a variety of organizational experts might need to address media inquiries. A workplace violence incident, for example, may require a representative from human resources and one from security to answer questions about preemployment screening and on-site precautions. Reporters want to ask questions directly to experts and don't want the information filtered through one generic spokesperson. Openness refers to the crisis team being willing to discuss the crisis with interested stakeholders, answer inquiries, and disclose information rather than stonewall information. Creating trust that the organization engages in full disclosure should be built prior to and not during a crisis. If an organization has a history of withholding information, stakeholders have no reason to believe that changes during a crisis.

Crises can create a unique stakeholder, the victim. Victims are people who are harmed by the crisis. The harm can be death, injuries, relocation, property damage, financial loss, stress, or inconvenience. Victims want their needs recognized and other stakeholders expect organizations to address any victims. Crisis managers should exhibit compassion for victims, but those expressions of sympathy do not need to include accepting responsibility for their injuries. Accepting responsibility opens an organization to legal claims and financial losses. Sympathy can be expressed without incurring legal and financial liabilities. It is important that the legal department review statements of sympathy. Moreover, crisis managers should check state laws to determine if sympathy statements are exempt from use in court, or if lawyers could use them against the organization in future litigation.

Victims are the reason for instructing and adjusting information. Instructing information tells stakeholders what they must do physically to protect themselves from the adverse effects of the crisis. A consumer needs to know how to identify a defective product and what process they must follow to get a refund, replacement, or repair. People living near a facility need to know when they should evacuate the area after an industrial accident. Adjusting information helps people to cope psychologically with the crisis. Victims and other stakeholders want to know what happened, why, and what is being done to prevent a repeat of the crisis. Of special concern is corrective action, the steps the organization is taking to prevent the crisis from happening again. A crisis creates psychological stress. Adjusting information reduces the stress by helping people to realize what happened and the efforts designed to prevent a repeat of the crisis. For example, when an airliner crashes, future travelers want to know why it crashed and what the airline is doing to prevent a similar crash. Stakeholders are less fearful of a crisis when they understand why it happened and that it is less likely to occur in the future.

Postcrisis managing information includes providing updates about the recovery, efforts to learn from a crisis by adding to the institutional memory, and conducting careful analyses of the crisis management program. Learning from a crisis is an example of managing information because it involves collecting, analyzing, and

recoding information, which can be a valuable resource for the next crisis.

Managing information postcrisis includes organizational change, healing, and coping with risks created by the crisis. Organizational change is related to crisis learning but focuses on managing meaning. An organization might learn from the crisis that structural factors precipitated the crisis. Managers must then convince others of the need to change those structural features. Change management is meaning management and works in tandem with learning.

Crisis communication is the lifeblood of the crisis management effort. Communication carries the vital information needed in a crisis management effort and is critical to shaping stakeholder meanings about the crisis, the organization in crisis, and the crisis response.

CRISIS INFORMATICS

Chris Hagar (2006) coined the phrase *crisis informatics* to describe an emerging field of research that examines how people, information, organizations, and technology are interconnected during a crisis. More specifically, crisis informatics examines the utilization of information and communication technology during mass emergencies. Crisis informatics reaches beyond crises because mass emergencies include disasters and other large-scale societal emergencies. The research includes understanding how first responders employ technology and how people in the community utilize technology during mass emergencies. For example, studies might examine how fire fighters integrate

technology into their responses or how citizens utilize Twitter to both send and receive information during an emergency.

The roots of crisis informatics can be traced back to 2004. In Brussels of that year, the Information Systems for Crisis Response and Management (ISCRAM) held its first meeting. It focused on the use of technology in crises and disasters drawing interest from researchers in computer and information sciences. In 2009, ISCRAM became a formal organization that holds international meetings regularly and developed its own publication. A search on an Internet search engine of the term *crisis informatics* results in many hits for papers presented at ISCRAM conferences.

The growing research interest in crisis informatics and funding of that research is testimony to the rapid development of this field. In the United States, the Natural Science Foundation provided a \$2.8 million grant for Empowering the Public with Information during a Crisis, better known as Project EPIC. Project EPIC is led by researchers from the University of Colorado at Boulder and University of California, Irvine and includes researchers from information sciences, computer sciences, and computational linguistics. One of the research lines in Project EPIC is “Tweak the Tweet” (TtT). TtT seeks to prove a shared hashtag-based syntax that makes it easier to extract emergency information from Tweets. The idea is that the increased information from Tweets can improve the emergency response. TtT combines both citizen and emergency responder use of information and communication technology.

The European Union continues to fund a variety of crisis informatics projects. One such project, WORKPAD (funded at €1.85 million), developed software applications that allow emergency responders to communicate and to coordinate their efforts more effectively and quickly during a crisis. The focus on improving emergency responses demonstrates how crisis informatics can be translated into lifesaving applications.

CRITICAL DISCOURSE ANALYSIS

Critical discourse analysis (CDA) is a variety of discourse analyses associated particularly with Norman Fairclough, in which the central focus is on the connections between discourse as social action and other facets of social life. More specifically, researchers using CDA are interested in the ways in which power produces and is produced by certain discourses. Broadly, critical discourse analysis allows contextual factors to be taken into account when analyzing text.

All discourse analytic approaches begin with the assumption that spoken and written language is a social practice. Language is action—speech, text, and image are not empty in themselves; they are active and used purposefully and with intent. They persuade, argue, deny, command, and question, among other outcomes. Additionally, a discursive perspective on action assumes that the discourse *itself* is the focus of analysis, rather than the thing to which the discourse refers. Finally, discourses

are recognized to be variable in their meaning, both between and within individuals. There is a wide variety of discourse analytical approaches and within this, a number of approaches to critical discourse analysis that apply theory, data, and methodological techniques differently.

The primary concern of all CDA is the historical and ideological production of social structure and power relations through language. Fairclough pointed out that the relative social positions of those engaged in semiosis results in different discursive representations of social practices. These different discursive representations, or orders of discourse, are both constructed by and constructive of social hierarchies. In this, CDA recognizes that legitimacy is both created and sustained through the meanings produced by language; it adheres to a relational understanding of the world, since the relative positions of individual agents in a field have to be considered in order for their discursive actions to be understood.

Fairclough is perhaps the scholar most widely associated with critical discourse analysis. He argued that texts are both social events in themselves as well as products of social practices. Discourse “figures” in social practice as genres, discourses, and styles. Genres, Fairclough reasoned, are ways of acting; discourses are ways of representing; while styles are ways of being. These are semiotic ways of acting and interacting, which transcend individual texts and reveal “intertextual relations” that characterize sets of related texts. These relations operate at the social level and are relatively stable over time.

Both structures of individual texts as well as discursive themes across texts are illustrative of the three aspects of discourse; therefore analysis addresses the composition of texts, grammatical structures, and semantic constructions. Fairclough pointed out that, although the distinction between genre, discourse, and style is analytically useful in practice, the three are related. Understanding the function of multiple connected texts—for example, a range of press releases focused on different types of a single product, such as a mobile phone—therefore requires a perspective that can address the specific dynamics of each, while also exploring how they work together to create a particular holistic social practice. Fairclough’s ideas on the ways hegemony is produced through discourse have been quite widely used by researchers to

underpin critical analyses of campaigns and other forms of professional communication.

Other researchers have taken a Foucauldian approach to critical discourse analysis as their starting point. Foucault emphasizes the disciplinary effects of discourse, the importance of knowledge to power, and the role played by different subjectivities in discourse. Ian Parker (1994), for example, suggested that a Foucauldian approach should examine the identities presented in the text, the relationships between them, and the themes that underpin these identities. Equally important is to notice modes of expression that are not used, or search for what is not said. Finally, the source of the text and the audience for it are critical to understanding subsequent versions of truth and power relations that are normatively represented in the text. This approach has been adopted in public relations research to good effect, demonstrating the ways in which public relations-generated discourses can privilege certain voices over others, excluding the knowledge associated with less powerful groups from the public sphere. In public relations research, Foucauldian discourse analysis is used sparingly, but effectively. For example, Judy Motion (2005) adopted a Foucauldian approach for her exploration of stakeholder engagement discourses of the New Zealand government, revealing the ways in which such discourses were deployed as a means of stakeholder control rather than stakeholder participation.

In contrast, Theo van Leeuwen’s (2008) framework for CDA focuses on “the primacy of practice” (p. 4) and understands discourse as a recontextualization of social practice. Van Leeuwen’s framework emphasized the connection of linguistic and nonlinguistic practices in texts. This leads to a focus on representations of action and actors in discourse, including not only what is done, but how it is done—performance modes and presentation styles—as well as where and when action is represented. At the same time, in recontextualizing social practice, van Leeuwen argued that discourse legitimizes that practice, offering “answers to the spoken or unspoken questions ‘Why should we do this?’” (p. 105). Through these various foci, the operation of power in particular contexts can be tracked. Lee Edwards and Magda Pieczka (2013) adopted van Leeuwen’s approach for their study of the representation of public relations in trade media, revealing the ways that particular representations of practice

and identity resulted in the construction of an archetypal field equipped to sustain its legitimacy in the face of ongoing critique.

For critical public relations scholars adopting a social constructivist perspective of public relations, CDA is an important tool for research. It enables a detailed deconstruction of public relations texts in ways that reveal not only their ostensible purpose, but also the ways in which the nuanced management of language, so fundamental to public relations practice, produces certain relations between social groups, distributes power to some and not to others, and allows certain types of knowledge to be recognized and others ignored.

CRITICAL RACE THEORY

Critical race theory (CRT) was conceptualized in the field of legal studies in the 1970s as a reaction to failed attempts at equalizing legal and civil rights of Black Americans after the civil rights movement. CRT not only describes the state of racial disparity in U.S. social systems, it also argues that civil rights efforts have been obstructed, in many aspects, because of systemic neglect to non-White groups.

Critical Race Theory and Public Relations

As an interdisciplinary theory, public relations scholars introduced CRT to public relations to explain identity-based discrepancies among the makeup of practitioners as well as the representation of people of color in research, campaigns, and education. For example, according to the U.S. Bureau of Labor Statistics in 2011, of the estimated 221,000 public relations specialists in the United States, 18.8% were non-White practitioners.

Among the management ranks, the representation of racial minority groups drops to 6.3%. A critical race examination of this data seeks to describe why the racial disparity among management cadres exists and explores which powerful bodies perpetuate the devaluing of practitioners of color in management.

In academe, an eye-opening CRT study by Donalyn Pompper (2005) found a considerable dearth of research focusing on or even acknowledging racial, ethnic, and cultural issues and publics in published public relations research. Pompper concluded that the field should connect more with research participants by contextualizing their cultural situations; triangulate methods and involve participants in data analysis; and work with international public relations students.

Two CRT concepts particularly relate to public relations: Whiteness and intersectionality. Specifically, CRT seeks social justice for people of color by exposing historically held norms that uphold White culture as the standard for education, economics, health, politics, and social behavior. Whiteness, then, is the status quo by which social power is unequally distributed among authoritative and marginalized groups. Unchecked Whiteness reduces groups to their racial status alone without considering how other identities either jeopardize or privilege them, time and time again. The cumulative effect on social groups' experiences with power and multiple identities is known as intersectionality.

Whiteness and Public Relations

The concept of Whiteness explains that White culture is the standard experience of society and that when one is *not* White, one has a different, alternate, less natural experience. As Whites comprise the largest and most powerful racial group, assuming White as the standard—and non-White experience as the deviation—constitutes a daily, routinized racism against the experiences of people of color.

In public relations, Whiteness emerges in the workplace and in messaging. Research suggests that practitioners from racial minority groups work within the norm of “color blindness” to race. Lee Edwards (2010) suggested this is problematic when practitioners are pigeonholed into raced projects and cannot express to colleagues that race plays a factor in decisions, such as building account

teams. Whiteness occurs in designing campaign messages that essentialize entire cultures into a few diluted, organizationally defined representations or advocate for behaviors that reflect White cultural values. Representations often reflect an organization's meaning about an issue, which can be far different from—and sometimes offensive to—the meanings held by a public. This miss in communication is a common effect of unrecognized Whiteness in campaign design.

Intersectionality and Public Relations

Identities do not exist in a vacuum, nor are they mutually exclusive in how they affect individuals' thoughts, beliefs, and behaviors. Rather, demographic and sociographic identities (e.g., race, gender, class, age, sexual orientation, ability, nationality/citizenship, religion, occupation, family composition, and health status, etc.) mix together and reproduce one another to influence how a person experiences different social systems, such as education, laws and legal authorities, health care and public health, criminal justice, and work.

Intersectionality refers to the network of interlocking identities that result in an unequal distribution of power across social groups. One consequence is essentialization of groups, which means assuming that all people who share a demographic then think and behave the same. This dilutes the rich experiences that different, multiple identities bring to individuals and groups, and it alienates publics from organizations. Another consequence is misrepresentation and mis-targeting of groups in media. Finally, social ills like chronic health disparities persist when the effects of intersectionality are left unchallenged because communication is assumed to be a “one size fits all” solution.

Future Critiques

Research should explore the contributions made by important public relations practitioners of color in history. Also, organizations should routinely build coalitions, use myriad social media, and encourage diversity training to help practitioners “unlearn the normalcy of being White” (Vardeman-Winter, 2011, p. 416). Finally, practitioners, researchers, and educators should critique representations of race in each campaign message,

research study, and curriculum because they cannot say the field is colorblind and that race is not an issue.

CRITICAL THEORY

Critical theory concerns three main areas: the first is as the object of academic attention of certain traditions of thought, especially the Frankfurt School and their successors; the second is as a set of methods that vary over time but consistently draw from different disciplines to examine root assumptions about knowledge; and the third, which sometimes links directly to political action (e.g., Western Marxism), involves critical views of social power arrangements in society.

Critical theory originated in the European Enlightenment’s *raison d’être* and is encapsulated in Immanuel Kant’s famous dictum “dare to know.” It gathered momentum as proponents not only dared to know, but also dared to act on that knowledge to overthrow the status quo. The key 20th-century moment was the 1917 Russian Revolution that linked theory to action with an international impact. In dramatic form, it posed the question of whether to support the existence, economics, and philosophy of the USSR or to oppose it. Before that revolution, critical theorist Karl Marx was just another philosopher; after it, he was a global point of political reference. Critical theorists in particular were put on the spot and the resulting test of praxis—not just rethinking the world, but remaking it—remains a specter haunting their writings.

Although the internationally supported “Occupy Wall Street” movement has continuities with such radical behavior, direct activism in the West diminished as a major part of critical theory outside public relations. Within public relations, noncorporate and nongovernment activists continue to struggle for recognition. Nevertheless, critical theorists retain elements of European Enlightenment optimism in their belief that applied rationality, the ability to openly question authority, can influence human activities and social structures in a democratic and life-enhancing way. In different approaches, the impacts of the Arab Spring, beginning in 2011, and the Global Financial Crisis (GFC), which began in 2008, reactivated interest in radical interrogations of existing systems.

In the first of the three areas of critical theory, (the relatively narrow academic one), the leading representative in public relations is Jürgen Habermas. Apart from Geert Hofstede, whose functional culture and organizations research became a staple of mainstream management, Habermas features more widely in public relations than any other European theorist. His concept of communicative rationality, which is anchored in “the unconstrained, unifying, consensus-bringing force of argumentative speech” (Habermas, 1984, p. 10) predates the more limited idea of two-way symmetrical communication. His associated advocacy of the ideal speech situation where all stakeholders participate equally in dialogue and resolve in favor of the best argument has affinities with and

usefully elaborates on the ideal goals for practice. This remains true despite the fact that communicative rationality and symmetry exist in theory rather than in practice.

For Habermas the aim of speech is to reach agreement on action and how to act. Additionally, all participants in conversation should accept a set of responsibilities as a result of taking part. These responsibilities include aspiring to agreement in a fair-minded way, encouraging open (e.g., independent of business, religious, or government interests) debate, listening as well as talking, and honoring any consensus reached. Participation in fair process and acceptance of the outcome becomes, in itself, a legitimating process, which Habermas extends beyond face-to-face talk into mediated communication. Public relations is influenced by Habermasian legitimation theory, which sets out and justifies normative guidelines for the consideration of public issues, and by his philosophy of the public sphere. The public sphere can be a physical place where citizens gather for a democratic exchange of ideas (e.g., a town square) or a media arena. The concept is anchored in, and partially restricted by, Habermas's imaginings of the political interchanges of middle-class men in early modern Europe's communal coffee houses. In what he saw as the subsequent denigration of communication from those conditions to an environment framed by consumerism, mass media, and state intrusions, Habermas positioned public relations, along with advertising and marketing, as powerful, if negative, agents in the decline.

Despite—or perhaps because of—this view, Habermas's writings add value to public relations. He is an informative and forceful advocate of the conditions needed for open public debate and for thinking through a social process for the social legitimation of ideas. Habermas worked to establish necessary preconditions for democratic communication: open access; the creation of public judgment through gatherings of citizens engaged in political deliberations; and freedom to discuss matters of the state, its powers, and its exercise of those powers. He also established a philosophical foundation on which to build long-term behavioral and ethical guidelines relevant to journalists, media policy makers, and communicators and grounded his idealism in an intellectual history of communication. That philosophy serves as a source

of knowledge and as a prototype for public communication that has already been adapted to social participation via technology through considerations of the Internet as a public sphere able to host open democratic discussion by “netizens,” or online citizens. This Internet sphere enables freer debates in relative equality and, as illustrated by the Wikileaks controversy of 2010, can even bring into question the rights of governments to withhold information by simultaneously circulating confidential documents globally.

In critical theory's second main area, its breadth of interdisciplinary methods, the Frankfurt School stands out. The Frankfurt-based Institute for Social Research, as it was originally called, was at odds with both capitalism and communism. The School set out critical theory as an activity that took society as its object and went beyond tensions between individual creativity and conventional organizational and social frameworks to combine Marxist-based criticism with aesthetics, existentialism, hermeneutics, psychoanalysis, and sociology to address a broad spectrum of issues from an emancipatory perspective. Although public relations still works from a narrower interdisciplinary base, it has over the past 15 years substantially widened its original range of influencing disciplines. These include both new and/or increased depth in work on anthropology, complexity science, economics, feminism, “new history,” postcolonial and subaltern studies, postmodernism, psychoanalysis, semiotics, and structuralism.

As the Frankfurt School's members fled the rise of German Fascism, its plural methods spread internationally. For example, in the United States Herbert Marcuse published *One-Dimensional Man* (1964/1991), a book based on a typical Frankfurt theme: the fall of revolutionary potential, and the rise of social repression resulting in an advanced consumer society producing one-dimensional humans with dulled thinking and the desire for oppositional action. Marcuse's response was to advocate “negative thinking” to keep the critical impulse alive. A fellow émigré to the United States, Theodor Adorno (1951/1974), identified a similar loss of hope that philosophy could change the world. In a century scarred by the experiences of atomic bombs in Japan and concentration camps in Europe, Adorno saw the Enlightenment dream of a just and reasonable society as degenerating

into barbarism and a nightmarish “iron cage” imprisoned in the “instrumental reason” of self-interested functionalism epitomized by narrow rationalization in bureaucracy, economics, and technoscience.

More recent critical theory publications are less pessimistic and better attuned to current public relations and social conditions. Zygmunt Bauman’s influential work on *Liquid Modernity* (2000), for example, sees contemporary power as economic, invisible, multinational, and infiltrating every aspect of life, but not in a rigid way. From Bauman’s perspective, the idea of liquid modernity replaces what was formerly theorized as solid, and therefore harder to shift, modernity (as typified by the “iron cage” imagery). Liquid society influences, and destabilizes, the very categories (e.g., ethnicity and race), and social structures (e.g., immigration), on which the societies of modernity are built. Xifra and McKie (2011) observed that by positioning public relations as part of the construction of the liquid fears, lives, and loves that create these fragile, changing, and uncertain times, Bauman raises the status of public relations and recognizes its ability, and responsibility, for making society more fully functional.

As well as exhibiting an interdisciplinary growth by importing outside theorists, public relations has seen an internal growth in material with different and distinct critical edges. New editions of the only two major pre-2000 collections that featured critical public relations have been published. Between them, the updated versions of Jacquie L’Etang and Magda Pieczka’s *Public Relations: Critical Debates and Contemporary Practice* (2006) and Robert L. Heath, Elizabeth L. Toth, and Damion Waymer’s *Rhetorical and Critical Studies in Public Relations II* (2009) include a diverse span extending from outlaw discourse and postmodern lists through critically self-reflective writing to multiple discursive analyses of the role of public relations in manufacturing and sustaining power relations in society. The content from the two collections covers topics from celebrity promotion, church sex scandals, civil society, and science communication to politics, sport, and tourism. These critiques are complemented by special issues of the *Australian Journal of Communication*, *The Journal of Public Relations Research*, and *Public Relations Review* that critically examined ideas from the margins,

race, and revisionist approaches to public relations history.

In the third area of critical theory—not just examining, but opposing injustices in the status quo—Habermas differed from most social critics by concentrating on the power of rationality rather than the power of power. There is a limited, but growing amount of that broader critical theory within public relations (Edwards, 2010). What exists tends to focus on asking tough questions about taken-for-granted inequalities. Most research clusters around critiques of how the field minimizes, or excludes, alternative forms of expression, how it restricts access in favor of the powerful rather than the disadvantaged, and how it stays complicit with big business and political elites. In one of the most direct critiques, Nancy Snow (2010) makes U.S. propaganda explicit in “Operation Iraqi Freedom and the war on terror. . . . [with] Weapons of Mass Destruction that never materialized, the manufactured hero-turned-all-too-human Jessica Lynch story, and the marketing of the war as a welcome liberation” (p. 11).

Greater attention to those kinds of critical theory concerns within the field could do much to counter damaging, and widely disseminated, allegations of public relations as “weapons of mass deception” by external critics. The lessons from issues management of talking to all stakeholders, including hostile ones, and unrecognized “stake seekers,” could be applied internally by taking seriously the challenges of critical theorists. Nevertheless, the influence of critical theory on public relations has increased, is increasing, and is likely to continue to increase. One reason is the growing influence of critical theory on other areas of management, especially allied areas, such as organizational communication and, in the wake of the GFC, economics. Other reasons include the globally expanding and pluralizing public relations literature with its associated trend toward greater philosophical breadth, depth, diversity, and openness, alongside the field’s internationalization into countries where critical theory is more common than in the United States and where universities are legally empowered to act as the conscience of society. These combine with, above all, the continuation of powerful economic and social forces seeking legitimacy for controversial topics

and interacting with public relations in the course of that search.

Estellés-Arolas and Fernando González-Ladrón-de-Guevara (2012; see also, Brabham, 2008) featured the participative dynamics that can be evoked by the source:

Crowdsourcing is a type of participative online activity in which an individual, an institution, a non-profit organization, or company proposes to a group of individuals of varying knowledge, heterogeneity, and number, via a flexible open call, the voluntary undertaking of a task. (pp. 9–10)

Crowdsourcing can be used to accomplish a specific task (microwork), create knowledge (“wisdom of the crowd”), vote as a group (crowdvoting), or initiate financial support within the community (crowdfunding). Whether the call asks the crowd to rate a new theme or logo for a brand or to share updates and information during a disaster, crowdsourcing provides a forum for democratic, inexpensive conversations with multiple voices and perspectives within the digital sphere.

While initially conducted offline, advances in communication technologies have expanded opportunities for crowdsourcing. Crowdsourcing emerged as companies asked their customers, loyal brand enthusiasts, and influencers about an issue facing the brand in question. The interaction between the companies and these stakeholders is dynamic and occurs in real time through online forums and platforms. Participation through these interactions can provide financial or online reputation benefits for the user (extrinsic rewards) or help the user feel connected and part of the social online community (intrinsic rewards). With the emergence of new tools to communicate directly with audiences, this phenomenon is breaking down the barriers in time and location. Companies can not only have a dialogue with these audiences but can also monitor their keyword searches with specific research techniques, such as data mining, use of Web analytics software to measure time each person spent on site, and social media monitoring software programs to create databases for monitory conversations on the topics sourced.

Crowdsourcing provides advantages to both crowd and crowdsourcer. The crowd enjoys the extrinsic and intrinsic benefits noted above, and the crowdsourcer obtains inexpensive assistance from a wide network. In some cases the input from

CROWDSOURCING

Crowdsourcing is a process by which unofficial, distributed groups of individuals (the “crowd”) voluntarily contribute solutions in response to an open call issued by an individual or organization (the crowdsourcer). The term *crowdsourcing* was coined by Jeff Howe in 2006. Continuing the efforts to conceptualize this phenomenon, Enrique

the crowd can be superior to input from focus groups and formal work groups because of the relatively anonymous, nonjudgmental format of the discussion. The focus in crowdsourcing remains on the problem, not on the individuals suggesting the solutions.

Among the concerns about crowdsourcing is the nonrandom nature of the crowd. Internet use is high in most countries but is not universal. On some platforms (e.g., Amazon's Mechanical Turk), low-income individuals from third world nations are more likely to participate, while in others (e.g., iStockphoto), the crowd can be highly trained professionals. Crowdsourcers must consider the fit of the likely responder to the goals of the organization when constructing and locating a call. The participation of many low-income individuals for low pay also raises ethical issues, in spite of the voluntary nature of the activity. Implicit participation, in which the crowd is unaware of their contributions, is viewed as an invasion of privacy issue.

CULTURAL FLOWS AND PUBLIC RELATIONS

Cultural flows are the dynamic transnational movement of ideas and innovations—physically and virtually—that result in variations of a shared cultural and global consciousness throughout most of the world. Globalization has paved the way for the swift flow of cultural ideas among nations.

Globalization is characterized by the global reach of international media organizations, the ease of travel and migration, the network of ever-evolving technologies and social media that allow instantaneous communication around the world, as well as the growing interdependence of national economies with their interconnected financial and commercial institutions. In addition to the innovations and business practices that have compressed the world, a component of globalization is the increased *consciousness* of the world as whole and *awareness* that the world is connected in a single social space, global public sphere, or “imagined world.”

The concept of cultural flows and an imagined world is attributed to Arjun Appadurai (1996), a cultural anthropologist who described five streams of cultural flows (which he calls *scapes*) that contribute to globalized, shared imaginary experiences. The first stream is *ethnoscape*, which is the shifting of people around the globe through travel and migration, which includes guest workers and international businesspersons and tourists as well as refugees and exiles. The movement of ethnicities contributes to political and philosophical changes among nations. The second concept, *technoscapes*, refers to the way technology, including machinery, hardware, and software, moves across borders, including borders that historically have been impervious. The flow of technology comes from governments as well as transnational corporations

but does not flow evenly to all parts of the world. *Mediascape* includes the distribution and capabilities of global communication networks, including commercial news and entertainment media, films, games, and social media. The mediascape is also the images of the world created by various media as well as the flow of information. *Financescape* is the interconnectedness of financial institutions, currency markets, stock exchanges, and commodity speculations. This concept of global capital flow is the most fluid, complex, and rapidly changing landscape. The fifth conceptualization is *ideoscape*, which is the flow of philosophical and political ideologies. This concept involves the power of nation-states and is closely connected to the flow of Western views of democracy and sovereignty. Cultural flows are fluid and in a constant state of flux; they contribute to a dynamic social coconstruction of reality.

Global cultural flows have created a transnational public sphere for the practice of public relations, and public relations messages contribute to global discourse. However, ideas and innovations do not flow evenly throughout the world; flows are more prevalent from dominant groups with more power, capital, and technology and the cultures of dominant nations are more deeply embedded in the global order. For public relations, this means that Western conceptualizations of practice are prevalent in public relations education and global practice.

While there are financial, political, and social advantages to deliberate global interconnectedness, there are also perceived threats. Cultural flows are seen by some as a threat to cultural identity that could result in global hybridization. The challenge for public relations practice in a global context is to be aware that cultural flows build multicultural societies but not necessarily homogeneous ones. Western public relations practices are often applied in cultures in which cultural differences make Western notions ineffective and not feasible. It can be argued that there is not a global context for public relations, but rather localized practices that respect cultural differences are necessary to achieve organizational goals in transcultural spaces because public relations involves not only messages but also representations of symbols and values. Public relations practitioners who operate in the global sphere must be aware of the

potential for backlash against globalization and possible resentment of globalization and Westernized worldviews. While holding a global perspective, practitioners must strategically localize their strategies to adapt to different cultures and work to make their organizations as indigenous as possible in the countries in which they operate.

Despite influences from a variety of cultures and increasingly globalized worldviews, individual societal cultures still hold different views of the world and even the imagined global social order is affected by the history and context of different groups. Worldviews change slowly and culture has a profound effect on communication. Cultural flows play an important role in the introduction of global ideas, but awareness does not automatically lead to acceptance.

CULTURAL INTELLIGENCE

Cultural intelligence (also *cultural quotient*, or CQ) seeks to help communicators understand why some people are able to function effectively in culturally diverse situations, while others struggle. Specifically addressed is the form of intelligence that allows a person to understand and reason in situations involving cultural diversity. In our increasingly global environment, CQ has since been applied to countless disciplines and situations ranging from military operations to religion and family communication, to library

sciences, to public relations. As such, it provides useful information related to how one copes in multicultural situations and is often related to the ability to succeed in culturally diverse groups. In other words, it addresses steps and approaches a person can take to be effective in culturally diverse situations.

Cultural intelligence is complementary to the more familiar concepts of cognitive intelligence (IQ) and emotional intelligence (EQ). In fact, the proposed four dimensions of CQ are based on foundations for the multiple foci of intelligence that outline both mental function and the actual display of behavior. These foci include (1) metacognitive (control of cognition), (2) cognitive (knowledge structures), (3) motivational (ability to focus energy on a task), and (4) behavioral (outward action or behavior).

P. Christopher Earley and Soon Ang (2003) used these factors to help explain cultural intelligence by featuring four dimensions. First, metacognitive CQ involves active thinking, or higher order cognitive processes, related to people and situations as it deals with a person's level of conscious cultural awareness. For example, when those with high metacognitive CQ are involved in cross-cultural interactions, they consciously question their cultural assumptions, reflect during the interaction, and adjust or adapt their cultural knowledge. As a result, those with high metacognitive CQ are more likely to act in culturally appropriate ways, meaning they have an increased chance of achieving their desired outcomes when communicating in cross-cultural situations. As a person makes sense of culturally diverse experiences, the person must judge their own thought processes. In other words, by using awareness and knowledge about one's own culture and the assumptions one may have about other cultures as a tool, expectations and assumptions are adjusted based on a person's actual experiences.

Next, cognitive CQ addresses a person's knowledge of cultural norms, values, and practices. It is believed these norms can be obtained formally, through education, or informally, through personal experiences. Cognitive CQ has three key elements, each of which is believed to influence thoughts and behaviors. These elements include one's knowledge of culture, cultural environment, and one's own culture. As a result, a person with

high cognitive CQ is expected to experience less confusion during intercultural communication. Cognitive CQ may include the simple concept of how cultures are similar or different. When assessing these similarities and differences, a person might take into account rules of specific languages and communication; norms associated with values and beliefs; and overarching business, economic, legal, and political systems.

The third dimension, motivational CQ, features the effort one makes to operate in a culturally diverse situation. Such efforts are thought to be a result of how a person analyzes a situation. Analysis involves looking at triggers, such as a person's perceived ability to accomplish a desired outcome, and the value they place on this end result. If someone has high motivational CQ, that means they probably make great efforts or assign additional energy toward learning about, functioning in, and ultimately being successful in cross-cultural interactions. In other words, motivational CQ involves a person's interest and confidence level during inclusion in culturally diverse situations. Motivating factors may involve anything from the benefits the person thinks he or she attains, to having confidence that he or she can be successful in these situations, to simply enjoying culturally diverse interactions.

Finally, behavioral CQ addresses the way one acts when one interacts with people from a different culture. As such, this dimension includes a person's ability to respond appropriately during these situations and is important because it involves a response to both verbal and nonverbal communication in a fluid environment. Successful communicators are good at decoding communication, which ultimately gives them clues about the sender's motivations and expectations, in order to respond in a socially acceptable manner. Those who have high behavioral CQ are often flexible, making changes to their behaviors based on individual cultural interactions. This means that as dictated by the situation or cultural differences, a person is able to adapt his or her own behavioral responses, such as gestures and accent or tone.

After reviewing the four dimensions of CQ, it is apparent why cultural intelligence is defined as a set of capabilities. Each dimension is distinct, yet each works together to form higher levels of cultural intelligence. This means that CQ can be

cultivated through personal experience, interactions, training, and education. In addition, these capabilities are not culture specific. In other words, cultural intelligence does not address the ability to function in a specific country or region. It does, however, focus on being able to function effectively in culturally diverse situations, which has much broader parameters.

Originally thought of as an individual capability, cultural intelligence was traditionally captured or quantified using the Cultural Intelligence Scale and involved both self-report or observer-report data. However, researchers are beginning to investigate the use of alternate scales as the concept is applied to teams, work groups, organizations, and social networks. As such, the concept of cultural intelligence improving intercultural encounters for the individual is expected to expand far beyond one person's capabilities.

CULTURAL THEORY OF RISK COMMUNICATION

Cultural theory of risk communication describes the risk communication process from an institutional and societal level. Whereas the mental models approach features elites (often scientists) as the interpreters of risk, which is then communicated to affected individuals, cultural theory

presumes a more interpretative approach. The theory is based on four premises:

1. Receivers of risk messages are active rather than passive and are members of institutions with cultures that provide interpretative frames for individuals, which may differ from those of elites.
2. Risks are not objective. They evoke different meaning and interpretation for different receivers depending on their cultures.
3. The interpreters of risk information are not individuals per se, but institutions. In any society, risks are managed and communicated by institutions, with different norms, perceptions, and positions in the risk management infrastructures.
4. Institutions are involved in political negotiation when deciding the meaning(s) and ethics of the risks communicated to and with the affected public. Thus, rather than agreement with the judgment of elites, cultural interpretation of risk presupposes the need for consensus at best but compromise at least among the engaged institutions.

Cultural theory provides a vital view of risk perception and risk communication by introducing the idea that risk meaning(s) are negotiated at an institutional and organizational level and exhibit a political character of risk controversies. As such, this theory of risk communication is the bedrock of societal risk deliberation, risk democracy.

Culture presumes that risk is not something objective that can be measured independent from culturally sensitive interpretations. Therefore, risk becomes a social construct, with different meanings to different individuals. Such meanings may differ as to the nature, cause, effect, and mitigation of the risk. It focuses on the ethics of the risk creator and risk bearer. It is likely to ponder whether the impact of risk by industrialization is shared fairly and equally based on a societal risk/benefit/harm metric. Thus, this theory underpins deliberations of that center attention on whether race or income affect the degree to which some segment of the population experiences unequal and unfair levels of risk.

Risk communication is based on the traditional model of information transmission, but it elevates risk decision making to a societal or cultural level.

For instance, its advocates are willing to argue that as technologies advanced in the last two centuries, the world is becoming a risk society. The final outcome of risk communication is to educate people (the receivers of messages) to ensure they understand the risks and, ultimately, the consequences of those risks. Cultural theory identifies receivers as active and privileged to employ different interpretative frames from those of the elite seeking to manage the risk. In other words, institutions follow organizational norms when communicating possible risks within the organization as well as to its publics. In this sense, there is a constant negotiation process of risk meanings and evaluations and power is a constant factor in such deliberations. Moreover, cultural theory focuses on the intrinsic political character of risk controversies and sheds light on the risk meaning–negotiating process and its political nature.

Cultural theory is said to originate in the work of Émile Durkheim and Ludwik Fleck. Anthropologist Mary Douglas was among the first researchers to use cultural theory in her argument for the necessity of researching risk as a cultural phenomenon. She proposed that risks as well as crises are not only scientific events but also political and cultural. In the modern society, the concept of risk becomes the product of large-scale institutions rather than individuals. Consequently, each society and form of social organization defines, interprets, and deals with or manages risks differently. By this logic, it is argued that the rationale for society is the collective management of risks.

Central to cultural theory are the concepts of accountability and politicized risks. Cultures are considered to be systems of persons that hold each other responsible. This mutual accountability has political implications, when assessing, arguing for, and communicating risks to different parties. That is not to say that individuals do not have responsibilities, but rather the level of accountability differs among different persons, depending on their culture or institution. For example, the journalism community has a different notion of risks than a medical or military community. In this sense, the rationale of collective risk management should bring parties together in society as this process is one of constant negotiation and leads to important heuristics, such as the precautionary principle. That principle is used to challenge innovation,

setting forth that the implication of risks associated with innovation must be understood and controlled before deserving public support.

Institutions have the responsibility to represent and publicly communicate this collective view of risk issues and to make certain that they provide the perspectives of all groups. Therefore, institutions are the ones negotiating in this politicized context of risk issues, and these controversies over risk issues are best resolved through compromise and not consensus.

Cultural theory features the typology of four archetypal cultures (also called solidarities): isolates, hierarchy, individualism, and egalitarianism. The grid varies from high to low. The basic assumptions are set into the two axes of typology:

1. The minimum form of commitment to life in a society is represented in terms of strength of allegiance to a group. The axis varies from weak to strong.
2. The extent of regulation inside or outside of the group. The axis varies from low to high.

These two assumptions lead to the four possible forms of social environment proposed by the typology. The four institutional forms described by the typology are interpreted to imply four idealized universal personality types. For example, the four types of people featured are believed to be concerned with different types of risks or hazards. Egalitarians are thought to be concerned with technology and the environment, individualists with war and other threats to the markets, hierarchists with law and order, and fatalists with none of the above. The cultural theory is consequently reduced to solely a psychological risk, perception risk theory based on individual traits. Other applications of this theory use this typology as a base for researching global risks or even for theorizing political science issues.

Cultural theorists expanded the scope and challenges of risk management and communication by featuring the intrinsically political nature of risks. Furthermore, in recent years, the theory has seriously progressed not only to the practical field, but moreover to the research on the politics of collective action and governance.

within a specific discourse field, such as the law. Communicators use topoi to generate arguments or to anticipate arguments they must prepare to refute. Widely used topoi include stock issues of policy debate (e.g., stasis) or lists of values that audience members believe.

This article discusses a system of topoi that developed to characterize cultural discourse within a society. Mary Douglas (1997) recently characterized culture as an accounting system. “Think of culture as essentially a dialogue that allocates praise and blame. Then focus particularly on the blame (p. 129).” From this view, culture involves a clash between competing views of social reality. A cultural topos is a set of coherent premises that supports a particular way of organizing social relations. These premises include perceptions of reality and value premises about what is desirable and good.

The cultural topoi framework identifies the underlying premises of competing accounting systems that participate in the discourse of praising and blaming. The premises that make up these topoi often require considerable effort to uncover because they are automatically accepted, or because they underlie second- and third-order premises that are actually voiced. The cultural premises that constitute the five competing cultural topoi are illustrated in Table 1. They are ordered from left to right in terms of the level of measurement that each cultural topos embodies.

CULTURAL TOPOI

Topoi are lines of argument that can be repeatedly used in debates (a *topos* is a single line of argument). General topoi can be employed across many subjects, whereas specific topoi apply only

Table 1 Cultural Topoi Compared

<i>Foundational Beliefs</i>	<i>Fatalist Topoi</i>	<i>Egalitarian Topoi</i>	<i>Hierarchical Topoi</i>	<i>Autonomous Individualist Topoi</i>	<i>Competitive Individualist Topoi</i>
Nature	Nature is capricious and unpredictable.	Nature is fragile; its equilibrium is precarious.	Nature is bountiful, if it has a gardener.	Nature is benevolent, if you match yourself to it.	Nature is bountiful and resilient.
Human nature	Human nature is capricious and unpredictable.	Human nature is good, but social inequality corrupts it.	Human nature is bent, but discipline can straighten it.	Human nature is ignorant, but it can be enlightened.	Human nature is self-seeking, but competition channels it productively.
Value imperative	Accept reality; don’t try to change it.	Seek equality.	Seek order.	Seek enlightenment.	Seek liberty.

<i>Foundational Beliefs</i>	<i>Fatalist Topoi</i>	<i>Egalitarian Topoi</i>	<i>Hierarchical Topoi</i>	<i>Autonomous Individualist Topoi</i>	<i>Competitive Individualist Topoi</i>
Decision principle	Let fate decide.	Seek consensus.	Legitimate authority decides. The chain of command implements.	One person, one vote.	Let the market decide.
Activity principle	Take what comes your way.	Do it for love.	Practice until you are good at it.	If you do it, avoid coercive entanglements.	Do whatever you do best.
Justice principle	Que será.	From each according to ability to each according to his need.	Give and receive according to rank.	To each an equal portion.	To each in proportion to her contribution.
Measurement level	None	Nominal	Ordinal	Interval	Ratio

Source: Leichty, G., & Warner, E. (2000). Cultural topoi: Implications for public relations. In R. L. Heath (Ed.), *Handbook of public relations* (pp. 61–75). Thousand Oaks, CA: Sage.

The cultural topoi originate in different ways of life that compete with each other. Each way of life is part of a cultural ecosystem that has an inherent requisite variety. Michael Thompson, Richard Ellis, and Aaron Wildavsky (1990) wrote, “Each way of life needs each of its rivals, either to make up for its deficiencies, or to exploit, or to define itself against. To destroy the other (way of life) is to murder the self” (p. 4). The ongoing competition between the cultural forms gives a particular group its unique cultural configuration. At one point in time, a single way of life may dominate a scene, or two ways of life may form a dominant coalition. The remaining ways of life are usually pushed toward the periphery of the cultural system. Indeed, egalitarianism typically appears as an ideology that critiques the status quo. Representative democracy itself is a coalition of cultures in which each way of life has a voice within a differentiated social structure.

The egalitarian and competitive individualist topoi usually vigorously oppose one another. The egalitarian topos privileges the value of social equality, whereas the competitive individualist topos elevates the value of individual freedom. The

egalitarian strongly resists reducing sacred values (i.e., human life) to a cash value, but the competitive individualist insists that everything should have a price (e.g., donor organs). However, cultural collaboration is possible even between these perennial antagonists. Egalitarians and competitive individuals were allies in constraining the reach of the federal government in the early decades of the American republic. Egalitarians feared that a strong federal government would increase social inequality, and competitive individualists feared that a strong federal government would undermine individual liberty. Cultural collaboration is often possible, when a particular strategy serves different ends for each way of life.

The cultural topoi perspective provides several analytic advantages. It offers a richer understanding of rhetorical options than the prevailing discourse of a right/left political spectrum. It provides a parsimonious framework for describing the social construction of reality while enabling cross-cultural comparisons and descriptions of cultural change. It also allows one to anticipate opportunities for collaboration between groups that typically oppose each other (e.g., egalitarian-oriented

democrats and Buchanan social conservatives uniting to oppose the North American Free Trade Agreement).

A cultural topoi framework also provides a springboard for investigating perceptions and discourse about risk. People with different ways of life fear different things. Those who fear ozone depletion are not more fearful than those who fear anarchy; it is cultural premises that alert us to some dangers and blind us to other dangers.

The perspective also explains how audiences come to different interpretations of the same message. To understand how a message is likely to be interpreted, the intricacies of cognitive dynamics do not need to be understood so much as there is a need to understand which cultural topos a message interpreter is applying. The credibility of a message depends on how closely it aligns with the receiver's underlying premises. When a message is consistent with the receiver's cultural premises, inference is facilitated. When it contains premises at odds with a receiver's cultural topos, the message is likely resisted.

Carl Botan and Francisco Soto (1998) defined a public "as an ongoing process of agreement on an interpretation" (p. 21). In many cases, the shared interpretation of a particular public stems from a shared cultural topos. The public relations function participates in the ongoing clash of perspectives that takes place in a democratic society. The cultural topoi perspective represents part of the tacit knowledge of astute practitioners. Such practitioners have a breadth of perspective that enables them to interact with audiences operating from different cultural premises. Public relations practitioners serve as interpretive intermediaries between an organization's management and important publics. They work to find rhetorical positions that enable alignment and collaboration between audiences operating from different cultural premises.

The cultural topoi framework also provides a useful heuristic for characterizing public relations practice. Public relations not only participates in cultural dialogue, but the same cultural processes operate to define and prescribe for public relations practice. In particular, competitive individualist and hierarchical versions of public relations practice have contended with each other since the early decades of the 20th century. Ivy Lee is an icon of competitive-individualist oriented practice, and

Edward Bernays is an icon of hierarchically oriented practice. In addition, egalitarian models of practice are emerging. Fittingly, the dialectic of praise and blame accounting, in which public relations participates, also plays an important role in constituting public relations practice.

CULTURE

Any competent communicator recognizes the importance of adapting a message to the audience(s). As audiences or potential audiences grow increasingly diverse, so too does the importance of understanding culture and cultural background. Whether crafting a basic press release or a major campaign, an awareness of culture, both that of relevant organizations and that of key publics, is critical to public relations practice. In general, culture is defined as understandings and practices shared by a group of people. Certainly, cultural knowledge plays an important role in message design and interpretation.

According to Krishnamurthy Sriramesh, despite some awareness of the important role of culture, research in public relations placed primary

attention on culture for less than two decades, and many scholars agree that still too few studies examine links between culture and public relations. Thus, this area remains a rich and important one for future inquiry.

In keeping with the spirit of that theme, Stephen P. Banks suggested that although culture shapes practice, public relations nevertheless is likely to exhibit some fundamental similarities across modern societies. Despite such uniformity, several key changes in and across societies resulted in variations in public relations practice.

Culture and Public Relations in the 21st Century

Because of such changes, Stephen P. Wakefield asserted that in the 21st century, public relations practitioners face new challenges. Once primarily a domestic undertaking, public relations has gone global. The increased number of multinational organizations, ease of transnational and worldwide communication, and global marketplace redefine the profession. Although some organizations and industries are more often affected, changes reverberate throughout organizational practice. Further, the advent and adoption of new communication technologies also link cultures and shape the practice of public relations, both locally and globally. In 2011, Michèle Schoenberger-Orgad defined the new role of practitioners as intermediaries between the international community and cultures.

Taking a lead on these matters, Sriramesh suggested in 2003 that, in the wake of globalization, the practice of domestic public relations gave way to international public relations, as most organizations are interested in international image and relationships. Thus, rather than maintaining its status as a subspecialty, international public relations and public relations practice essentially are now synonyms. With such changes in outlook and practice, skills in communicating with multiple publics across differing cultures are essential. For example, in her 2012 study, Kate Fitch concluded that although a number of skills were needed (e.g., adaptability), intercultural competence had become a crucial new challenge to professional practice.

Among these challenges are the pressures arising from globalization. On this theme, Sriramesh in 2002 noted that the practice involves increasing

numbers of nations and cultures, and, despite these challenges, Wakefield (2000) cautioned that

precious little information exists to help multinational organizations to understand the global nature of their public relations or to guide them as they develop resources not only to get their messages out to increasingly cross-cultural publics, but also to anticipate and respond to behaviors by those publics that could affect the organizations. (p. 639)

This lack of information hampers efforts and places in jeopardy the achievement of organizational goals. “Multinationals need to understand the nuances of public relations between countries, or even in different regions within countries, and how misunderstandings of those nuances can bring problems on a global scale” (Wakefield, 2000, p. 640). Perusal of recent publications on public relations reveals that many focus on considerations and practice in particular countries or regions; however, much work remains to be done on adapting to the global public relations landscape.

Views of Culture

Work on culture, organizations, and public relations has produced two assessment lenses. One takes a primarily internal focus, viewing organizations as distinct cultures, with their own beliefs and practices, emerging from and adapting to surrounding cultures. The other is more external, examining the role of public relations in adapting to and influencing culture and cross-cultural issues. Separating culture and cultural difference, Wendy Hall proposed in 1995 that they must be addressed on two levels. The first is the organizational level. For example, some organizations, even in different nations, share similar cultures, perhaps due to their type and structure. The second is the national or individual level, which recognizes that culture varies by country with individuals, groups, and organizations being influenced. Understanding of both levels is essential.

Within the first view, each organization is seen as a distinct culture with its own value system (e.g., where particular behaviors or outcomes are more valued). Once entrenched, organizational cultures are relatively stable, though they do evolve and

change over time (e.g., especially with key changes, such as the appointment of a new CEO). If an organization diversifies into new locations, its culture shapes those facilities, but it must also adapt to local culture. Such transitions are easier when organizational and local cultures are similar, and they can be facilitated by public relations efforts.

Within the second view, general cultural characteristics and their influence on individuals are salient. National cultures are very stable, with changes taking place slowly. In addition, distinct regional variations are common. Therefore, in 2000, Doug Newsom, Judy VanSlykeTurk, and Dean Kruckeberg reasoned that the successful public relations practitioner needs to understand a country's government, power structure, laws and legal system, public and private sectors, financial system and markets, and media. In this vein, Gang Han and Ai Zhang's 2009 examination of the shutdown of Starbucks in the Forbidden City deals with the importance of understanding international and national context and the interplay of cultural and intercultural tensions.

Several typologies have emerged that characterize cultural differences. One of the leaders in the study of culture, Geert Hofstede, proposed that four dimensions—individualism/collectivism, uncertainty avoidance, power distance, and masculinity/femininity—are commonly employed to describe cultural variation. He later added a fifth dimension, long-term versus short-term orientation. Expanding on Hofstede by proposing eight cultural qualities, Marlene Rossman's system included attitudes about time, formality, individualism, hierarchy, religion, taste/diet, colors/numbers/symbols, and assimilation and acculturation.

Areas of Research

Comparing intercultural communication and international public relations, R. S. Zaharna (2000) described three lines of research. The first, "culture-specific," seeks to pinpoint communicative behaviors common in a culture. A considerable amount of public relations work, especially from the "comparative public relations" perspective (i.e., delineating public relations practice in particular countries or regions), is indicative of this line of research.

The second, "culture-general," attempts to uncover practices common across cultures. For

example, much attention has been devoted to assessing the similarity of public relations goals and functions regardless of the specific location of practice. In 2003, Dennis L. Wilcox, Glen T. Cameron, Philip H. Ault, and Warren K. Agee maintained that the goals of public relations are essentially the same (e.g., creating and sustaining favorable conditions and relationships for operation, assessing the potential for and avoiding opposition and negative situations, and managing crises to minimize damage) regardless of the country or culture of practice. However, a variety of factors make intercultural communication and public relations more challenging: differences in language, customs, chain of command, media and public relations practice, and perception of individuals and nations. Thus, practitioners must learn as much about local customs and culture as possible, but they also need to consult cultural insiders for guidance.

The third area, "intercultural interaction," draws from each of the previous two and examines the communication of interactants from different cultures. Thus, the focus moves "from individual *communication behaviors* to exploring . . . how different behaviors affected the *communication process*" (Zaharna, 2000, p. 90, italics in original). Examples in public relations work are studies examining how public relations programs are evaluated through cultural lenses.

Flexibility is a new job skill created by globalization. As Newsom et al. (2000) noted,

despite the ability to build generalizable theory by incorporating multiple cultures and disciplines, difference among cultures must be addressed. What works in one country might not work well in another country because of national culture, political and economic infrastructure, media systems, and research protocols. (p. 651)

Multicultural Education

Stressing the new era in multicultural education, Kenneth Starck and Kruckeberg (2000) suggested that

a major contribution that public relations educators can make is to help students become interculturally literate, for the sine qua non of this newly emerging global economy is intercultural communication. One of our major goals should be to

promote intercultural literacy among present and future public relations practitioners. (p. 58)

Building and maintaining positive relationships rests on understanding cultural nuances. As Wakefield (2000) asserted, “although the interactions of diverse cultural groups can foster harmony, they also can produce opposite effects, such as more entrenched stereotypes and increased suspicions, misunderstandings, tribalism, and conflict” (p. 639). Clearly, effective communication is essential and public relations practitioners can help shape outcomes.

That messages need to be adapted to audiences is an age-old principle of communication. The increasing cultural diversity of audiences makes this concept an even more important one.

CUTLIP, SCOTT M.

As the senior author of a leading textbook, *Effective Public Relations*, Cutlip is regarded by many as the father of public relations education in the United States during the second half of the 20th century. He also remains the field's most eminent historian.

Cutlip introduced the study of public relations at the University of Wisconsin School of Journalism in 1946 and continued as a Wisconsin faculty member until 1975, when he became a professor at the University of Georgia, Athens. He served as dean of the Henry W. Grady School (now College) of Journalism and Mass Communication at Georgia from 1976 to 1983 and was a university professor until his retirement in 1985.

A proud native of West Virginia, Cutlip received a bachelor's degree from Syracuse University and a Ph.M. degree in journalism and political science from Wisconsin in 1941. He worked as reporter, weekly newspaper editor, and press secretary to a gubernatorial candidate in West Virginia prior to attending Syracuse, where he worked for three years as an assistant in Syracuse's Bureau of Public Information.

Upon graduation from Wisconsin, Cutlip served as public relations director for the State Road

Commission of West Virginia. Then, during World War II, he served as a public information officer and a counterintelligence officer for the U.S. Army, attaining the rank of major.

In 1952, Cutlip and coauthor Allen H. Center, an official of Parker Pen Company and later Motorola, published the first edition of *Effective Public Relations*, which was updated with new editions in 1958, 1964, 1971, 1978, 1985, 1994, and 1999. The book was widely adopted as a college textbook and translated into Italian, Spanish, Korean, and Japanese editions. The Public Relations Society of America (PRSA) adopted the book as the basic text for its accreditation examination. Cutlip and Center entrusted the book's legacy to Glen M. Broom, who joined them as coauthor beginning with the sixth edition in 1985.

Cutlip and Center's cornerstone concept was the *four-step public relations process* as a model for organizing public relations programs. The first edition emphasized the importance of fact finding, planning, and communication. The fourth step, evaluation, was not added until the second edition in 1958. The model has been usurped by strategic communication approaches that follow more general business planning models, but continues to be the criteria for judging in PRSA's Silver Anvil Award and many regional competitions recognizing outstanding public relations programs.

Cutlip's other major early contribution was compilation of the first comprehensive bibliography of public relations, produced in 1957 and updated in 1965. Former student Robert L. Bishop produced a third edition in 1974. Annual bibliographies in the Cutlip tradition began to be published soon thereafter in *Public Relations Review*.

Cutlip is familiar to many philanthropic and fundraising professionals as the author of the most comprehensive early history of American fundraising. He also edited a volume on public opinion for public administrators. In 1975, he cochaired with J. Carroll Bateman the first commission on undergraduate public relations education.

Cutlip's passion for public relations history was evident in many of his early scholarly journal articles. He also played a pivotal role in securing the personal papers of many early public relations pioneers, such as John W. Hill and Earl Newsom, which are now preserved and accessible to scholars

at the Mass Communication History Center of the State Historical Society of Wisconsin in Madison.

In retirement, Cutlip compiled his extensive research on early public relations in two books. One title examined the roots of the practice before the 20th century; the second tome profiled the work of a dozen leading practitioners from the first half of the 20th century.

Cutlip was honored in 1972 with PRSA's first Distinguished Public Relations Teaching award and in 1990 with the society's Gold Anvil award for the advancement of the public relations. In 1991, he became only the 10th individual—the first in public relations—to receive the prestigious Paul J. Deutschmann Award for Excellence in Research from the Association for Education in Journalism and Mass Communication.

D

DEADLINE

A deadline is the day and time when a media release or other contact must be in to newsrooms if the story is to have a chance to be aired or printed on that news day. Media correspondents operate in news cycles. They work stories for a specific period of time, within 1 day or over several days. They have deadlines that allow them to properly prepare a story in time to go to press or go on the air.

A deadline is the time when a newspaper or a station can no longer receive a story for a specific printing or broadcast. A newspaper typically has one deadline for each day's printing. Radio might have several deadlines for the various news segments. Most television stations have news deadlines for morning, noon, evening, and nightly news. Deadlines can correspond to the kind of audience the organization is trying to reach—drive time or evening news, for instance. News television stations such as CNN may have hourly news deadlines.

Deadlines are one of the hard realities in the news and public relations businesses. Because of the preparation times that are required to gather news details and prepare stories for print and airing, news departments establish deadlines. Public relations practitioners must know the deadlines for each news venue where they would like to have a story appear.

In preparation for getting reporters' attention to their media releases, practitioners may need a campaign plan that includes set schedules. Part of

setting each schedule is to *backtime*. Backtiming means that practitioners set a schedule starting from the date a campaign must be executed and scheduling backward to set the times when each element of the campaign must be started to meet the deadlines of the various reporters whose attention they seek.

A lot of preparation can be wasted if at some crucial moment the practitioners fail to have the news information to the reporters within the limits of their deadlines. Stories that are pitched too soon may be forgotten by the date of the event. Releases that reach reporters after the deadline will necessarily fail to be printed or aired as part of the regular news.

Because of the combination of campaign schedules and media deadlines, any observant reader, listener, or viewer can predict certain events by what they see happening. For instance, it is not a matter of accident or coincidence that a major star appears on early-morning or late-night talk shows just days before a release of a movie or CD featuring the artist. All of that "news" is carefully timed to meet deadlines and campaign schedules. It is intended to create interest, or buzz, about the movie or CD and enhance sales.

Thus, deadlines affect when the practitioner needs to get information to the reporters in time to pitch an event. Another variation of this theme can become a reality during crisis response. If something newsworthy happens, reporters are likely to contact a company spokesperson, for instance, seeking comment. If the comment comes too late, the story is likely to air or be printed without the

company's side of the story being included. Even worse might be the inclusion of one of the following statements by reporters: "The company did not respond to our inquiries by air time" or "This reporter tried repeatedly to contact the company without success." Such comments indict the company, make it seem guilty, and damage its reputation or image. Experienced practitioners provide recorded telephone message information that allows reporters to find them, perhaps through a pager, at virtually any hour of the day. They know that they must be available as needed to meet reporters' deadlines for a working story, especially one concerning a crisis.

DECISION THEORY

Decision theory is the analysis of decision making through the logical, systematic evaluation of decision alternatives. Understanding decision theory is important to public relations because the function involves high-level decision making and counseling the dominant coalition on decision alternatives, particularly as it affects issues management.

Discussing the process, Francis Heylighen (2012, n.p.) wrote: "Decision theory is a body of knowledge and related analytical techniques of different degrees of formality designed to help a decision maker choose among a set of alternatives in light of their possible consequences." This noteworthy definition covers all areas of decision making, whether based in statistics, ethics, management, public relations, or issues management. Much of the literature in the decision discipline discusses it as a mathematical framework for reducing uncertainty. Another definition of decision theory, from the *McGraw-Hill Encyclopedia of Science & Technology*, states, "Decision Theory: A broad spectrum of concepts and techniques which have been developed to both describe and rationalize the process of decision making, that is, making a choice among several possible alternatives" (p. 66). Generally, decision theory falls into the areas of decision making under

three conditions: (1) certainty (which is uncommon in issues management), (2) uncertainty or ambiguity, and (3) risk.

Utility

A recurring theme in decision theory is utility. *Utility* is a measure of the benefit of each decision alternative, or what consequences the alternative may bring. Expected utility is the potential outcomes of a decision and their usefulness to the decision maker. Decision theory often holds that the best decision is the one that generates the greatest expected utility.

Tapan Biswas (1997) offered that the decision maker is normally conceived in theoretical decision models as a *utility maximizer*. However, many decision theorists have noted that in reality, people often make choices that are less than maximized, choosing things that result from an imperfect situation or will simply satisfy their needs. Thus, satisficing is when the decision maker is unable to maximize utility because of imperfect information or alternatives but makes do with what is available.

Stephen P. Robbins (1990) explained *satisficing* as "Good enough replaces maximization as a criterion of effectiveness" (p. 263). Because satisficing does not lead to optimal conditions or results, it generally renders a temporary solution. Problems that are not resolved to the satisfaction of all parties, including those decisions that simply satisfice, prove to be an unstable base for relationship building in public relations.

Factors that influence decision making are complex. John P. van Gigch (1974) wrote, "The search process by which the mind generates alternatives is still only partially understood" (p. 59). For example, consider the pressure of human interaction on the decision. Ronald R. Sims (1994) stated, "Pressure toward conformity . . . is the main factor that leads individuals to make and own defective decisions" (p. 56). Commonly referred to as "group think," the influence exerted by social norms, role expectations, group membership, and fear of negative repercussions is considerable. Decision theory is an attempt to assuage the influences of these factors in favor of a more scientific decision-making framework.

Another factor that influences decision making is the choices, or lack thereof, perceived by the

decision maker as possible or available to him or her. A decision is only as good as the best choice available to the decision maker. However, the decision maker must be free to actually enact an option before considering it a viable alternative, worthy of analysis, investigation, and potential implementation. At this juncture, autonomy and options are vitally important. Frederic Schick in 1997 argued, "Choices presuppose options, and having the option of doing something implies that you think you are free to do it" (p. 9).

Dealing with decisions under conditions of relative certainty, one can employ decision trees listing the various decision alternatives available and the probabilities associated with the outcomes of each.

Decision Making Under Risk: Bayesian Theory

Thomas Bayes, who lived from 1702 to 1761, was a mathematician who first used probability inductively and established a mathematical basis for probability inference. Probability inference is a logical means of calculating, from the number of times an event has not occurred, the probability that it will occur in future trials. In his discussion of decision theory involving risk, Schick (1997) stated: "The maximizing-utility logic of risk is often called *Bayesian*. The Bayesian form of logic assumes precise numerical utilities and probabilities" (p. 38).

This mathematical basis for decision making is called the *Bayesian theorem*. It uses probability theory as logic and serves as a starting point for inference problems. A logical consequence of the Bayesian theorem is *Bayes' rule*, a decision-making rule whereby one acts to maximize the expected posterior utility. In simpler terms, one acts where the probability of attaining one's goal is highest. This concept is analogous to acting on the highest expected utility or value in a decision tree.

Bayes' theorem is being used at an increasing rate in many branches of science and technology, such as drug trials overseen by the Food and Drug Administration, as well as in management, in organizations such as Microsoft. The application of Bayes' theorem requires advanced computing resources and knowledge of applying the theorem to practical decisions.

Decision Making Under Uncertainty or Ambiguity

In decisions being made under conditions of uncertainty or ambiguity, the complexity of choices containing many options of varying utilities poses difficulty. Schick (1997) termed these types of scenarios "multidimensional choosing, multi-attribute or multi-objective choosing" (p. 41). Complexity is compounded when decision alternatives can have unknown utility or unintended consequences. There are two approaches that "solve for" the condition of uncertainty: (1) the maximins rule and (2) the subjective probabilities approach.

Schick (1997) explained the maximins rule as the "option whose worst or *minimal* outcome is the best or *maximal* of the different worst possibles" (p. 37). The concept of maximins, or choosing the option that maximizes the minimum outcome, is a principle that must be carefully implemented to avoid limiting long-term options. In practical application, maximins mean choosing the decision alternative that provides the lowest chance for problems and the highest probability of maximum utility.

In the subjective probabilities approach, research is conducted to gather as much information as possible. Then, with the aid of historical data, experts assign projected probabilities to each decision alternative. This approach is a systematic attempt to reduce the impact of a lack of information on the decision. However, it is difficult, if not impossible, to attain precision and apportion probabilities when problems are vague. Indeterminate problems can create imprecision in the tools decision theory uses in measuring weighted averages. The possibility for error or miscalculation is high due to the subjective and indeterminate nature of this approach.

Decision Theory in Public Relations

Decision making is a crucial concern for an organization because it affects all individual and group efforts to make and negotiate decisions and resolve issues. Practically every act in public relations is a result of a decision among alternatives. Application of decision theory to public relations can enhance effective management. Perhaps the most important area of application is issues management or top-level organizational decision making on matters of policy, consequence, and ethics. In

this area, it is necessary to evaluate decision alternatives under conditions of imperfect information (ambiguity or uncertainty) and risk.

Conflict is inherent in decision making, and issues management decisions are often a contentious interplay of competing interests. Decision theory provides the public relations practitioner with a logical and rational framework within which to analyze alternatives and maximize the efficacy of decisions.

DEFAMATION (LIBEL AND SLANDER)

At one time, the field of defamation was separated into libel (written) and slander (oral). This separation assumed that a more permanent record of the defamation had the potential for greater harm. But with new technologies such as radio and television, with the potential for the spoken word reaching millions of people, and with audio and video recordings being at least semipermanent, the reasons for the distinction have vanished.

The key component of defamation is a statement or inference of fact that has the tendency

either to harm the plaintiff's reputation and lower the plaintiff in the esteem of the community or to harm the plaintiff's business or organization by deterring people from doing business with them. The plaintiff can be an individual, a corporation (either for profit or nonprofit), or some other organization. However, in the United States, the government cannot sue for defamation.

The issue of defamation is important for public relation practitioners because it is the "most common, and perhaps the most serious, legal problem facing the mass communications industry. . . . Nearly every press release, news article, or advertisement holds the potential for a libel suit" (Moore, Farrar, & Collins, 1998, pp. 188–189). As noted by a number of commentators, defamation law is very frustrating and erratic. The lines are not very distinct and do not adequately protect either media or communication professionals from the costs of defending themselves in law suits, nor does the law provide adequate protection for the plaintiff who has been defamed. There have been several suggestions for improvement, such as the American Bar Association's Uniform Correction or Clarification of Defamation Act and the Annenberg Washington Program's Libel Reform Act, but they have not been adopted.

The elements that go into making up a defamation suit are publication, identification, defamation, and fault. The defamatory statement has to be "published" to at least one person other than the plaintiff and the defendant. The scope of the publishing goes to the issue of harm and damages. The plaintiff then has to be identified in some way; otherwise the plaintiff has not been harmed. The identification does not have to be by name if there are surrounding facts that would enable the community to identify the plaintiff. The statement also has to be capable of decreasing the reputation of the plaintiff in the estimation of a relevant community. And since 1964 in *New York Times v. Sullivan* (public officials), and 1974 in *Gertz v. Robert Welch, Inc.* (public figures/private figures), the plaintiff has to prove fault on the part of the defendant. If the plaintiff is a public official or a public figure, either all-purpose (i.e., occupying a position of pervasive influence in society or having a name recognized by the general public) or limited (involved in a limited public controversy), the level of fault that the plaintiff has to prove is actual

malice, meaning the defendant acted with knowledge that the statement was false or with reckless disregard of its truth or falsity. If the plaintiff is a private figure not involved in a public controversy, there has to be some level of fault proven, but that level is left up to the individual state courts. It is usually some level of negligence, but it cannot be strict liability, which means that if there is publication, identification, and defamation, fault on the part of the defendant is assumed. Negligence is a much easier burden of proof for the plaintiff to meet than is malice, and often, as a result, defamation cases are decided at the threshold level of the classification of the plaintiff as either public or private.

There are defenses against defamation suits based on the First Amendment (*New York Times* and *Gertz*) that are intended to ensure that communication is protected, absent actual malice, and to ensure uninhibited and robust debate on matters of public concern. In addition, certain common law defenses are also available. These include truth that can be proven. In other words, the statement in question does not have to be absolutely true but true in the crux of the charge being made (see *Masson v. New Yorker Magazine, Inc.*, 501 U.S. 496 [1991]). There may be a privilege to disseminate the information. The privilege may be absolutely protected by law or qualified, if the dissemination is fair and accurate. Another defense is the expression of fair comment and opinion, which allows for criticism of plays, restaurants, governmental policies, and so on (see *Milkovich v. Lorain Journal Co.*, 487 U.S. 1 [1990]). There are other defenses that don't come into play as much, such as neutral reportage, consent, and right of reply.

Often what the potential plaintiff is looking for is an apology or a retraction, but negotiations for redress are often unsuccessful, and the issue goes to court (Moore et al., 1998, p. 189). Although an injunction may be possible in some cases (usually not favored because of free speech implications), the usual remedy if the plaintiff succeeds is monetary damages. Nominal damages are awarded if the plaintiff was right but suffered little or no damage to reputation. Special damages are provable out-of-pocket losses. General or presumed damages attempt to compensate plaintiff for damage to reputation. Punitive damages tend to be large in amount and are designed to dissuade the defendant from taking similar actions in the future.

After *Gertz*, plaintiffs cannot be awarded general or punitive damages without meeting the actual malice standard.

Defamation is the most common legal concern of communication professionals. Knowledge of the basics of defamation law is essential for public relations practitioners. Changing technology will lead to even more challenges and a continuing need to keep current in the area.

DELIBERATIVE DEMOCRACY

Deliberative democracy is an idealized form of sociopolitical discussion in which people are expected to reach consensus about a political decision by way of reasoned argument. The decisions over which people deliberate typically concern how to establish policies, formulate laws, and set up institutions. When citizens or politicians deliberate with one another, they are obligated to provide reasons that justify the decisions, laws, and policies they support. Strict deliberative democracy is rarely, and often with difficulty, realized in practice. However, its advocates argue that it is not intended to be a descriptive theory about how political decision making actually works; rather, it is a normative ideal about how citizens and organizations in a

democracy should conduct discussions with one another. With respect to public relations, deliberative democracy represents a dialogic ideal of how political leaders and organizations should communicate with their publics.

Deliberative democracy differs from other forms of political decision making such as elite rule, aggregation, and bargaining. It differs most from elite rule, particularly in its authoritarian forms, because it emphasizes the right of everyone affected by a political decision to participate and be treated equally in discussions about its viability. Deliberative democracy should also be distinguished from aggregative conceptions of democracy and political decision making. When people deliberate over a decision, they are expected to express, challenge, and above all to justify their reasons for supporting or opposing it. By contrast, aggregative political procedures require people only to express their preferences, and they generally take the model of “one person, one vote.” One example is when people vote for candidates or policies in elections; another is when they answer questions about preferences on public opinion surveys. Finally, deliberative democracy should not be confused with bargaining. Bargaining consists of negotiations among people who try to exert certain types of power to promote their own interests, and the best outcome it can achieve is a compromise among rivals. By contrast, deliberation aims for the more demanding cooperative goal of consensus about a political decision that the deliberating group as a whole could agree is most acceptable.

Critics have pointed out several problems with the ideals and procedures of deliberative democracy. One is that the goal of consensus is too difficult for people to achieve under actual circumstances. Particularly in diverse societies—where different groups of people hold incommensurable cultural values, and where media systems are becoming increasingly fragmented—the deliberative process might aggravate disagreements and differences between groups more than it brings about consensus. A second criticism is that people often arrive at consensus by overlooking or excluding the views of society’s less powerful members. The public relations profession might aggravate this problem because it is usually wealthy or powerful clients who have greater access to the public discussion and more resources to devote to expressing their views and getting them

accepted. Third, feminist, multiculturalist, and post-modernist critics have argued that the deliberative procedures of expressing and arguing about reasons is ethnocentric and culturally determined; for this reason, those procedures by their very nature discriminate against those who may not be competent in these culturally determined skills. A fourth criticism is that, among all the activities necessary for politics, deliberation ranks relatively low compared to other, more urgent political activities such as educating, organizing, mobilizing, demonstrating, campaigning, fundraising, voting, and ruling.

Defenders of deliberative democracy respond to these criticisms by noting that, even if the act of deliberation may not always be perfectly realized in practice, the deliberative ideal still serves to remind people about communicative virtues and obligations they should honor. First, the deliberative ideal reminds people that they should regard their fellow citizens as reasonable people whose views are worthy of respect and consideration. Second, it reminds people that they should be fair to one another: everyone with a stake in a political decision should be allowed to participate in deliberation and to have equal opportunity to express their views. Third, the deliberative ideal reminds communicators that they should express their views in publicly accessible ways: people who advocate certain decisions should make sure that their reasons for supporting those decisions are both available and understandable to their fellow citizens. Finally, the ideal reminds people that they should hold themselves accountable to others by being willing to answer objections and provide justifications for the decisions they advocate.

The purpose of honoring these virtues is to enable public discussion to take place among people who have different values and worldviews, support different policies and decisions, and have different reasons for justifying their decisions. But on the question of whether public relations contributes to this purpose, there are mixed views.

Critics of public relations claim that the profession undermines deliberative virtues because it typically serves the wealthy and powerful; as a result, it perpetuates an imbalance of power between elites who have greater ability to control public discussion and set its agenda and ordinary people who do not have the resources and abilities to make their views heard. Under such conditions, public relations tends

to work against deliberative ideals of inclusiveness, reciprocity, and equality, and publics tend to be the passive receivers of communications and political decisions rather than active participants in them.

But in defense of public relations, several counterclaims can be made. One is that the influential professional philosophy of dialogic communication coincides with the deliberative ideals of inclusiveness, reciprocity, and equality. Second, public relations efforts that promote social causes and movements could be seen as a political realization of these ideals. Third, when the profession serves the goals of relationship-management, reciprocity is further served because public relations gives people who have complaints about powerful people or institutions a way to not only hear from but also speak to them. Fourth, if the purpose of public relations is to make people's reasons for their actions and decisions public, then it serves the deliberative ideal of accessibility. Finally, public relations enhances accountability because it creates an adversarial marketplace of ideas in which public communicators challenge one another's reasons and justifications; as a result, it enriches public debate.

All of these critics' and defenders' claims, however, continue to be contested.

marital status, household size, geographic location, education, and ethnic background. *American Demographics* magazine uses the acronym RAGE to explain the more popular demographic variables examined by the Census Bureau and other organizations: race, age, gender, and education. For public relations practitioners in particular, demographic characteristics help one to better define target publics and to tailor messages and programs especially for them. For instance, although one organization may be interested in enhancing its awareness among preteens, another organization may be planning to focus on senior citizens when launching a new service.

Demographic information plays a key role in the research process. This information is usually requested when primary research is being conducted. Using both qualitative and quantitative research methods, sponsoring organizations seek to distinguish demographic characteristics for an array of variables. First, the sponsoring organization can calculate descriptive statistical analyses to examine the mean, median, and mode in order to describe the population being researched. Further, patterns in the data can be detected.

Second, the sponsoring organization can calculate differential statistical analyses to determine whether particular characteristics serve as predictors of behavior. For instance, an organization may learn that gender significantly influences how much money a person spends on formal dress attire. Or one might determine from the results that age significantly influences the types of media its primary publics refer to when seeking information.

Valuable demographic information can also be obtained via an array of secondary resources, such as the U.S. Census Bureau and other organizations responsible for collecting ongoing demographic and market data about a given population. For example, various research and governmental entities collect data among a broad spectrum of segments, ranging from industry-specific (e.g., retail, health, education, and entertainment) to gender, income, age, and consumer lifestyle activities and trends. With access to the World Wide Web, a plethora of information is now available, free of charge, via the Internet.

However, demographics, independently, may not be the most feasible characteristics on which to focus. Much of the literature recommends

DEMOGRAPHICS

Demographics represent the physical characteristics of a population, such as age, occupation,

examining demographics in tandem with various psychographic characteristics such as lifestyles, attitudes, and personal values. Together, demographic and psychographic characteristics can paint a vivid picture of a *potential* public. The practitioner also can learn valuable information about the *present* primary publics the organization is serving. For example, managers at a local convention and visitors bureau (CVB) located in Michigan may conduct survey research to learn more about vacationers who travel to this destination. From their research, they learn that most vacationers come from neighboring states because Michigan offers travelers opportunities within a drivable distance. The data further indicate that these travelers represent families with children under the age of 18 years with an average gross family income of between \$40,000 and \$60,000 and at least one parent having earned a bachelor's degree.

The psychographic portion of the research reveals that these travelers engage in outdoor recreational activities; they are very interpersonally oriented, they refer to the Internet when seeking information about making travel plans, and although they are not “cheap” per se, they do value “bang for their vacation buck.” This information can aid CVB managers in developing communication programs that further enhance relationships among their key traveling publics. They also can use the information to develop promotional communication campaigns to attract potential new visitors to the area.

DEONTOLOGY

Immanuel Kant (1724–1804), the progenitor of deontology, is among the most influential philosophers of the Western intellectual tradition. Kant taught and wrote late in the Modern period of philosophy, defined as the 1500s through the 1700s. Kant's doctrines had such an impact on philosophy that they were considered a revolutionary approach, worthy of consideration separately from all other schools and philosophers.

Kant authored an enormous volume of philosophical writings on topics as diverse as geometry, political theory, the physics of time and space, metaphysics, geography, cosmology, and moral philosophy. Kant's moral philosophy and the ethical theory of deontology that developed from his work are of primary concern in public relations.

Who Was Immanuel Kant?

Kant was born in Königsberg, Germany, in 1724, where he lived almost exclusively until his death in 1804. He began his career as a mathematics professor at the University of Königsberg, where he was appointed to a chair of metaphysics at age 46. He went on to become “the first great professor of philosophy” (Beck, 1963, p. x). Paul Guyer wrote that “Kant's *Critique of Pure Reason* (1781) shook the very foundations of the intellectual world” (1992, p. i). Kant's impact can be seen in almost all subsequent philosophical schools.

Kant was fourth of nine children of a harness maker; evaluations of their economic status ranged from modest to impoverished. He was reared in a

Protestant family and later called the premier philosopher of Protestantism due to his unadulterated belief in individual autonomy. Although Kant's writings were perceived as foreboding, he gained renown for his lectures and drew students from throughout Europe. A former student described Kant's "playfulness, wit, and humor" and, although Kant is often portrayed as a solitary individual, friends lauded his social graces and skill as a conversationalist.

Kant was a productive author, producing 20 books and hundreds of essays, most in German and several in Latin (Sullivan, 1989). He was also an inspiring professor; a former student remarked, "His hearers certainly never left a single lecture in his ethics without having become better men" (Beck, 1963, p. ix).

Kant's Contribution

Kant radically altered the thought patterns in Western culture and turned philosophy inward toward the self. Herbert J. Paton, an emeritus professor of moral philosophy at the University of Oxford, asserted: "Kant contrived to say something new about morality. This remarkable achievement has compelled every subsequent writer on moral philosophy to examine his views" (1967, p. 15). All philosophers must now include Kant in their philosophizing and argue for or against his doctrines because his impact is so great that he cannot be ignored.

Kantian contributions to philosophy include his expositions of moral worth, duty, and good will. Moral worth and duty are arguably the most well-known tenets of his doctrine, but Marcia Baron (1995) explained that these two constructs are tools Kant used to illustrate the crux of his philosophy: the good will. Baron explained, "The good will is manifested in actions done from duty" (p. 183). Actions done from duty differ from actions inspired by inclination or self-interest. Therefore, Kant's discussion of duty provides a means to analyze the good will. Kant's exposition of the morally good will profoundly influenced the course of philosophy.

Deontology: Kant's Moral Philosophy

The term *deontology* is derived from the Latin word for "duty," indicating the central role that

acting from obligation to uphold moral law plays in Kantian philosophy. Deontology is defined as "the ethical theory taking duty as the basis of morality" (Flew, 1979, p. 88). This branch of ethics asserts that an act is morally worthy if it upholds one's moral obligation. Kantian philosophy is a prime example of a nonconsequentialist approach to ethics, meaning that actions are not justified by their consequences. Rather, the consequences of a decision are noted, but they are equal to other considerations. The determining factor in Kantian philosophy is whether the act upholds a universal duty to the moral law as defined by the good will or good intention. However, deontology is too complex to be summarized so briefly, and is best understood as a synergy of its theoretical components. The core theoretical components in deontology (Bowen, 2004a, p. 70) are as follows:

- Transcendentalism and rationality
- The law of autonomy
- The categorical imperative
- Duty
- Dignity and respect
- Intention—a morally good will

Transcendentalism and Rationality

Kant attempted to show the primacy of moral decision making over logical positivism and pure empiricism, which were popular in his day. Deontology incorporates the strengths of both rationalism and empiricism and attempts to avoid the flaws in each.

Kant's contribution to methodology was introducing what he called a *transcendental deduction*. Roger Scruton explained, "An argument is transcendental if it 'transcends' the limits of empirical inquiry, so as to establish the a priori conditions of experience" (1982, p. 23). Kant's philosophy was transcendental because it arose from the elements of human cognition, which are not purely empirical but also based on sensation and intuition. Matt McCormick explained the transcendental deduction as the structure imposed by the mind on external things that makes experience possible. Reality as seen by the mind is a common concept today, but it was a revolutionary idea in Kant's time. The importance of Kant's *Critique of Pure Reason*

(trans. 1997) is that it restructured the way the intellectual world conceived of reality.

Kant's rationality argument (in the 1977 book *Prolegomena to Any Future Metaphysics That Will Be Able to Come Forward as Science*) is in direct response to the moral skepticism of British philosopher David Hume, who thought passion was a driving force for ethics. Disagreeing with Hume, Kant held that the rationality of the human agent was a necessary condition for moral decision making. Kant based his theory on the understanding that people have a rational, moral reason that is capable of "determin[ing] how we should act and also be able to motivate us to act on [our] judgments without relying on any prior desires" (Sullivan, 1989, p. 45). Kant defined reason as "the faculty of principles" and believed that the ability to reason was the basis for morally worthy decisions—as opposed to self-interest, greed, fiat, or similar factors. This belief in the individual decision maker forms the basis of Kant's philosophy.

Law of Autonomy

Kant derived the maxims for his moral philosophy from his law of autonomy, which stated, "A moral agent is an agent who can act autonomously, that is, as a law unto himself or herself, on the basis of objective maxims of his or her reason alone" (Sullivan, 1989, p. 48). Kant added that universality is the key on which the law of autonomy rests; he called this "the idea of the will of every rational being as a will which makes universal law" (trans. 1964, p. 98).

The idea of a universal law includes the reversibility concept of the decision maker being on the "receiving end" of a decision. Therefore, if a rational person is free to act autonomously in willing his or her moral will to become universal law, then it must be a moral decision.

Kant articulated the theory that a person has the autonomous power to act as an independent decision maker, using only good will and rationality. His law of autonomy states that a decision should be made through reason, rationality, and moral duty, rather than on the subjective concerns that promote one's personal advantage, or the advantage of the organization or client above others. Kant regarded autonomy as a moral absolute and as an obligation

that provides the basis for a powerful moral norm in the form of the categorical imperative.

Categorical Imperative

The guide to moral decision making that Kant based on the law of autonomy is the categorical imperative. The categorical imperative is a test that can be employed to address ethical dilemmas in practice.

Categorical refers to the fact that all moral agents are obligated absolutely, "not hypothetically or conditionally" (Sullivan, 1989, p. 49). The categorical imperative goes beyond the Golden Rule—do unto others as you would have them do unto you. Kant argued that the Golden Rule is based on merely prudential maxims of self-interest rather than a morally good will and is thus simply a norm of prudential reciprocity. Further, Kant maintained that the Golden Rule does not require "the respect owed others or duties of benevolence to them" (Sullivan, 1989, p. 204).

The categorical imperative is a powerful norm of moral behavior because it is grounded in universal applicability. Paton (1967) argued, "To judge our own actions by the same universal standard we apply to the actions of others is an essential condition of morality" (p. 73). The categorical imperative is a valuable guide for public relations ethics because it reduces the potential for subjective or biased interpretations.

Duty

There are three forms of Kant's categorical imperative, but the most well known is Form 1 from his *Groundwork of the Metaphysic of Morals* (trans. 1964): "Act only on that maxim through which you can at the same time will that it should become a universal law" (p. 88). A maxim is a principle on which a subject acts.

Kant contended that acting according to universal duty is obligated by people's ability to reason and act autonomously and occurs out of reverence or respect for the moral law. Doing one's duty to uphold the moral law results in happiness, in Kant's view. In fact, he defined ethics as being worthy of happiness.

Kant argued that feelings and desires are subjective and that morality would be reduced to

prudence if these were used to guide moral decisions. Sullivan (1989) asserted, “The categorical imperative commands us, not to allow ourselves to be ruled by our feelings and inclinations” (p. 120).

Acting from duty is seen in deontology as morally worthy. Acting from compulsion is still moral but far less worthy. For this reason, codes of ethics in public relations, such as the Public Relations Society of America (PRSA) Code of Ethics and Professional Standards, rarely have a punitive component. Acting ethically is considered the duty of public relations professionals, and moral worth is found in desiring to be an ethical practitioner and acting accordingly out of a sense of duty.

Dignity and Respect

Form 2 of the categorical imperative is again based on the law of autonomy but focuses on the dignity and respect inherent to all autonomous people. It states, “Act in such a way that you always treat humanity, whether in your own person or in the person of any other, never simply as a means, but always at the same time as an end” (Kant, trans. 1964, p. 96).

This form of the categorical imperative is often interpreted as Kant’s law of justice because it obligates people to respect all other human beings and themselves as well. Kant maintained that all people are deserving of dignity, respect, and self-respect. Scruton (1982) clarified, “The autonomous being is both the agent and repository of all value, and exists, as Kant puts it, as an end in himself” (p. 70).

Every person is equal in Kant’s view, and this assertion was a radical—and dangerous—break with the prevailing view of aristocracy in Kant’s day. In fact, during the reigns of both kings of Prussia—Frederick the Great and Frederick William II—Kant had to exercise extreme care in publishing his revolutionary ideas.

Intention or the Morally Good Will

A morally good will holds the highest moral worth in deontology. Kant (trans. 1964) wrote, “Nothing can possibly be conceived in the world, or even out of it, which can be called good without qualification, except a *good will*” (p. 61). Kant discussed the possibility of courage, happiness, and other good characteristics becoming evil when

possessed by the maleficent person. Happiness, he noted, could even inspire vanity and presumption if not complemented by a good will. He concluded, “Thus a good will appears to constitute the indispensable condition for even being worthy of happiness” (trans. 1964, p. 154).

In Form 3 of the categorical imperative, intention is where Kant concludes his test of ethics. Kant conceived of acts in terms of the motivation behind the action. People are obligated to act according to duty, but the intentions behind the action determine the action’s moral worth. Kant believed that ethical actions are undertaken with the intention of upholding one’s duty to the moral law.

Kant believed that a morally good will gives equally high worth and dignity to all people who possess it. He had faith in the ability to reason of the common person, and he argued that one need not be highly educated to understand and possess a moral character. Sullivan explicated, “Kant’s entire moral philosophy can be understood as a protest against distinctions based on the far less important criteria of rank, wealth, and privilege” (1989, p. 197). Kant’s categorical imperative shows that he was a truly egalitarian philosopher because every person, regardless of socioeconomic status, is capable of achieving the highest known achievement—a good will.

Conclusion

There are several advantages in applying deontology to public relations decisions rather than a utilitarian paradigm or less rigorous schools of thought. Utilitarianism asks the decision maker to predict future consequences of an action, often an impossible task. Utilitarianism always favors the interests of the majority, even though a small public might have valuable ethical insight into an issue that would go unattended. Utilitarianism can also be used to justify questionable activities in an “ends justifies the means” approach.

Deontology suffers from none of these drawbacks; furthermore, it offers a consistent, rational, methodical approach to ethical decisions. The clear imperatives of deontology allow organizational values to be followed in a reliable manner. Such consistency can enhance the reputation of an organization as ethical, thereby building and maintaining relationships with publics by allowing the

organization to be known and to regularly meet the expectations of publics.

Kantian deontology has been applied to public relations theory, empirically testing deontological theory, its frequency of use in public relations, and assessing the ethical paradigms of public relations practitioners, as indicated in the suggested readings, along with other applications. Many argue that it is the most rigorous and promising guide for ethics in public relations.

Scholars found deontology to be used in public relations practice, and the commonality of its usage increases with the years of experience and responsibility level of the public relations practitioner. Public relations executives are highly likely to use a deontological framework to help resolve ethical dilemmas in their issues management. Deontology provides public relations' most rigorous means for practitioners to analyze ethical dilemmas. Kant's moral theory is both philosophically sophisticated and immanently practical for use in public relations.

DE-POSITIONING

Positioning a product or service in a market and differentiating it from the competition are strategies widely viewed as ethical and professional, as long as assertions made in the campaign are accurate, complete, and fair. The same cannot be said for a different practice: de-positioning, which seems to mean undermining a competitor's product or service using any means available.

De-positioning, in the view of some proponents, means attacking a competitor's new idea, product, or service the moment it surfaces. The attack begins even before all the facts are available. It means rushing to get your own new idea, product, or service out even if it isn't fully developed. It means generating sufficient chaos and confusion to discredit a competitor's new product, idea, or service or to spoil its launch.

There are many problems with de-positioning, not the least of which is the damage a de-positioning campaign can do to your own industry. If you attack product X unmercifully, consumers might start to wonder about product Y and product Z, and they

might eventually get around to wondering about your product. An attack against a competitor can actually be an attack against yourself if the campaign has an unanticipated and negative impact on your product or service.

De-positioning also lowers the ethical and moral tone of society generally and of business, fundraising, and other practices specifically. This hurts any organization that is trying to get a fair hearing from the public for a product or service and makes it hard for honest businesses and non-profit organizations to establish and to maintain high credibility with their publics.

An organization that tries to de-position the competition uses questionable techniques that, when publicized, will harm the organization's prospects. It can take years and a good deal of hard work to polish a tarnished image. When those de-positioning activities are exposed, as they surely will be, they will be described as unethical.

Consumers are poorly served by de-positioning activities. If company X really does have a super new product but cannot get it accepted because of the confusion created by company Y's de-positioning efforts, consumers will be the primary losers. Worse, consumers might buy company Y's bad product (rushed off the assembly line before it was ready just to de-position company X's product), rather than company X's superior product. All of this is good for company Y in the near term, but it is bad for everyone else, and it will be bad for company Y in the long term.

DIALOGUE

The dialogic approach to communication goes back to the Socratic notion of dialogue (or dialectic) as a philosophical tool for uncovering truth and discovering knowledge. Modern treatments of dialogue have described it as an interpersonal conversational

technique based on respect and trust, and as an approach, or orientation, toward others.

Dozens of features of dialogue have been identified by scholars and professionals. The five basic tenets of dialogue include risk (a willingness to interact with others and to be changed), trust (fairness and openness), proximity (spontaneous, honest, face-to-face contact), empathy (supportiveness), mutuality (a recognition of shared goals and interests), and commitment (to ethical conversation). As Rob Anderson, Kenneth Cissna, and Ronald Arnett (1994) explained, "Dialogue is a dimension of communication quality that keeps communicators more focused on mutuality and relationship than on self-interest, more concerned with discovering than disclosing, more interested in access than in domination" (p. 2).

Public relations professionals have been interested in using dialogue as a public relations tool for decades (cf. Pearson, 1989). Dozens of studies have examined dialogue as part of web pages, social media, relationship building, and stakeholder communication. Dozens of studies of dialogue have also found that organizations' use of dialogue is limited, and that most professional communicators need more training in order to enact dialogue more effectively.

Dialogue is an ethical process or orientation toward others that tries to avoid treating people instrumentally or letting the more powerful take advantage of the less powerful. Dialogue is a complex communicative skill like public speaking or interpersonal communication, not simply a sharing of information. Posting information to social media websites like Twitter or Facebook is not an example of dialogue. "Talk" does not equal dialogue.

Each dialogic concept is integral to achieving an "ethical" conversation. For example, when individuals or groups with divergent beliefs are interacting, each party must be able to trust that the other party will not exploit them. An activist who agrees to meet with an organizational representative must be able to trust that the organization is not simply trying to distract the group while it secretly lobbies Congress or takes some other action. Without trust, authentic, mutually oriented communication cannot occur. Dialogic interlocutors must be willing to risk, taking a chance that the other party will be honest and forthright.

Authentic dialogue is said to require spontaneous, face-to-face, interpersonal interaction. Both

parties must be committed to the process of dialogue, or conversation, and both parties must be able to interact in real time, and in a face-to-face fashion. Most mediated communication, including social media, are therefore excluded from any dialogic process, unless special processes are created for interaction. Dialogue typically requires two or a few people to be in the same room or interacting in a shared space.

True dialogue is not achieved through sporadic or infrequent interactions. Trust and empathetic understanding are built over time, through repeated conversations and the pursuit of mutually beneficial goals. True dialogue requires commitment to the conversational process.

Dialogue has been studied by an assortment of scholars from diverse fields of study including communication, philosophy, political science, and psychology. As Carl Rogers suggested of his dialogic approach to therapy, dialogue is about “unconditional positive regard” for the other. In *Pedagogy of the Oppressed*, Paolo Freire (1994) suggested, “Dialogue cannot exist without humility. . . . How can I dialogue if I am closed to—and even offended by—the contribution of others?” (pp. 71–72). And Michael Kent and Maureen Taylor (1998) conceived of dialogue as a public relations tool, with dialogic communication referring to the negotiated exchange of ideas and opinions.

Dialogic denotes a communicative give-and-take and is guided by two principles: First, individuals who engage in dialogue do not necessarily have to agree; quite often they vehemently disagree. However, what they share is a willingness to try to reach mutually satisfying positions. Second, dialogic communication is about intersubjectivity, or understanding the other person(s) well enough to sympathize and empathize.

Implicit in the notion of dialogue is the belief that the orientation that one holds toward others influences the quality of communication and, ultimately, influences the development of relationships. When interlocutors are viewed as alien, or “other,” effective conversation (involving risk, trust, empathy, etc.) is more difficult.

One of the obstacles to using dialogue as a practical public relations tool has been the variety of ways that the term *dialogue* has been used. To political pundits, dialogue often means talk. To political scientists, dialogue often refers to public

forums where political leaders express opinions (public debates). And, until recently, dialogue in public relations was equated with symmetrical theory. The equating of dialogue with two-way symmetrical communication, however, has primarily been the result of casual language use. More recent treatments of dialogue in public relations have focused on dialogue as a framework for effective (and ethical) organization–public communication.

Most public relations treatments of dialogue have made it clear that dialogue is not simply a procedural approach to effective communication. Because everyone in a group is allowed to have a voice does not mean that dialogue has occurred. Rather, dialogue requires professional training in dialogic skills, commitment on the part of organizations and publics to communicate ethically (according to a set of mutually agreed upon conversational rules), and a willingness to try to act in the mutual interest of both organizations and publics.

DIFFERENTIATION

The concept of differentiation is one of the most basic to human perception. Psychologists have studied the human (and other animals) cognitive processes by which they distinguish one thing from others. This basic ability is essential to survival. For instance, differentiation allows humans to know what is edible and what is not.

By this logic, organizations need to stand out as unique among their competitors for resources. Thus, marketing, management, and communication professionals seek to differentiate their organizations, as well as their products and services, from those of their competitors.

Differentiation results when stakeholders (markets and publics) make attributions about an organization that, at least in part, distinguish it as different or unique in some meaningful way. The assumption is that customers make strategic distinctions among competitors. The most obvious distinctions might be as simple as price, quality, availability, customer relations, and reputation of the organization.

Differentiation is also vital for nonprofit organizations. They work to provide unique community-based services. Thus, some support the arts (museums or theaters). Others address needs of specific populations. For instance, nonprofit hospitals raise money to provide services that might depend on a specialty (burn treatment or cancer treatment) or for a demographic class (children or the indigent). The United Way differentiates itself by raising funds for a variety of charitable purposes. The Light House for the Blind serves individuals who have limited or no vision capability.

Differentiation occurs even in the governmental sector. Some agencies build or repair roads. Others provide emergency and safety (police, fire) response. Some protect water quality, and others handle

solid waste. Various military branches compete for funding based on their unique service to national security. The United States Postal Service competes with commercial package delivery rivals.

Differentiation is a marketing decision. Businesses are differentiated by product line (chemical manufacturing versus farm implement manufacturing) and by product type or line (pickups, SUVs, minivans, sedans, or subcompacts). Product positioning can include filling a market niche, such as high-cost luxury watches versus low-cost sports watches. Discount stores are different from top-end department stores and specialty boutiques.

Placement can also be a matter of differentiation. At the counter of movie theatres one would expect popcorn, soft drinks, hot dogs, and candy, but not pickups and farm equipment. Specialty products are often sold in specialty stores or even by brand name. Apple, for instance, knows and benefits from this principle.

Positioning is also a matter of differentiation. What markets does a company serve? What markets within its industry does it not serve? Is it retail or wholesale? Is it long on service and short on product? Or is it the opposite? Quality is also a positioning decision that can differentiate products and the companies that sell them. Think of the varieties of alcoholic beverages that are available—to satisfy all tastes.

Many of the matters of differentiation mentioned above are the primary responsibility of marketing. Others come closer to the purview of public relations. Some advocate, for instance, that customer relations should be a primary function of public relations. Organizations differentiate themselves by how well they respond to the needs, wants, and concerns of customers. Product support can be a matter of differentiation, as well as the return policy.

Public relations is especially responsible for the character and reputation of organizations. Organizations attempt to differentiate themselves by how they relate to the people in the communities where they operate. Some organizations build rapport and solid relationships with persons in the community. These relationships can differentiate the organization by demonstrating its commitment to the community. They work to prove that they operate in the public interest. The way an organization seeks (or fails) to build goodwill can differentiate it from

other organizations. Is it open? Is it ethical, aspiring to the highest standards of corporate responsibility? Does it share control with the members of the community? Is it willing to work to solve issues, or does it seek to dominate their resolution? Does it foster and work to meet values of its stakeholders, such as working toward a diverse workforce or demonstrating a commitment to environmental protection?

Brand identity and reputation of an organization features the attributes that stakeholders use when they think about it. The strongest theoretical foundation for this line of analysis can be derived from information integration theory. This conceptualization of differentiation assumes that each set of stakeholders can have different (and compatible or incompatible) views of the same organization, including products and services. Employees see it as a good place to work, because it supports them and produces products or services that foster pride among the workforce. Customers may ignore the elements of employee relations but focus on those attributes of the organization most relevant to purchases or service use.

The list of attributes that are used to differentiate one organization from another, one industry from another, or one service group from another is both endless and fairly limited. On the one hand, terms relevant to a set of services in the military may be used to attract recruits to one branch of the military based on its differences; serving in the air force is different from serving in the navy or army. The basic attributes then may be “land,” “air,” and “sea.” On the other hand, one unifying theme across all branches (differentiating them from other organizations) might be “leadership training” and “technology training.” Thus, information integration theory suggests that people carve their experiences into discrete categories and make decisions accordingly.

Product claims are a vital part of product or service differentiation. Marketing, advertising, and public relations specialists work to decide which claims do the best job of differentiating in ways that lead, for instance, to increased sales. Soft drinks are “refreshing,” beauty products make us more “attractive,” and package delivery is “next day” and “overnight.”

Designing, producing, and getting the product or service to the customer is a marketing function.

Letting the customer know about the service is an advertising or public relations function. Here publicity and promotion support advertising to get the message before the stakeholder and create awareness, recognition, and recall. Combined, these functions lead to a motivation to buy, donate, use, attend, and so on.

Beyond publicity and promotion, public relations helps align interests with employees, customers, competitors, community residents, investors, legislators, regulators, and so forth. Public relations also assists organizations with their efforts to differentiate themselves on issue positions as well as to respond during a crisis.

DIFFUSION OF INNOVATIONS THEORY

Diffusion of innovations theory examines how new ideas, practices, or objects are adopted by individuals and organizations (or other “units of adoption”)—a field of research important to public relations practitioners advocating change.

Beginning in the 1950s, Everett M. Rogers, the leading researcher in the field, developed the most comprehensive model of how innovations are

adopted. The robustness of diffusion theory is evident in how its early focus has changed from examining the acceptance of new strains of hybrid seeds among American and developing-country farmers to Rogers's contemporary analyses of the adoption of new communications technologies.

The major tenet of diffusion theory is that people undergo a five-step process that begins with awareness, followed by interest, evaluation, trial, and adoption. These steps are alternatively labeled knowledge, persuasion, decision, implementation, and confirmation (acceptance or rejection). The consequences of adopting a new innovation are alternatively categorized as desirable or undesirable, direct or indirect, or anticipated to unanticipated.

According to Rogers, three sets of variables influence the acceptance of innovations. Prior conditions provide a context for the consideration of changes by adopters. Examples include previous practices, felt needs or problems, innovativeness as a characteristic of the individual or organization, and norms (expectations) of the social system in which the adoption occurs.

Characteristics of the decision-making unit relate to systemic or inherent characteristics of the adopter, suggesting that certain individuals or groups might be more open to change. Characteristics include socioeconomic factors (age, education, status, financial well-being, etc.), personality variables (curiosity, open-mindedness, etc.), and communication behaviors.

Characteristics of the innovation itself influence acceptance. Rogers suggested that innovations are more likely to gain acceptance if they provide a relative advantage compared to the ideas they replace or to alternative solutions. Acceptance is also more likely when innovations offer compatibility with existing processes or ideas, simplicity (versus complexity), trialability (the ability to experiment on a limited and risk-free basis), and observability (being tangible and readily inspected).

Rogers posited that the adoption rate for innovations follows an S-shaped curve in which adoption begins slowly but rapidly escalates once a critical mass is achieved. Rates of adoption will then taper off after reaching a peak. The relative steepness or shape of the S-curve explains how some innovations are quickly adopted (sharp, steep rise) or require longer times for acceptance (a wider, flatter curve).

Diffusion theory suggests that adopters can be categorized as to their rate or readiness of accepting new ideas or objects. Rogers alternatively defines and describe these groups as follows:

Innovators—adventuresome, eager to try new ideas; more cosmopolitan than their peers

Early adopters—respectable localites (less cosmopolitan than innovators), usually with a high degree of opinion leadership within the social system

Early majority—deliberate, interacting frequently with their peers but seldom holding leadership positions

Late majority—skeptical, often adopting an innovation because of economic uncertainty or increasing network pressure

Laggards—traditionalists who are localites, including near-isolates and people whose point of reference is the past

Advocates for change, such as public relations practitioners, are designated as *change agents* in the parlance of diffusion theory. A change agent is usually a professional person who attempts to influence the adoption process in a way deemed desirable.

Early diffusion research examined the degree of homophily or similarity between the change agent and the adopter. The more these parties share common beliefs, the greater the rate of acceptance. However, most change agents are better educated and enjoy higher socioeconomic status than the people they attempt to influence. This makes these groups heterophilous. To overcome differences, change agents must find ways to establish a commonality between themselves and their target audiences. In some cases, this involves employing opinion leaders, community leaders, sales people, and local agents as third-party intermediaries.

Criticisms of Diffusion Theory

Although more than 4,000 published studies have been completed, diffusion theory treats the adoption of innovations as a rational process in which people thoughtfully consider innovations. However, many low-involvement innovations don't necessarily follow the rational approach

assumed in diffusion theory. Although diffusion theory provides a useful umbrella concept, the exact processes for the adoption of any particular innovation can vary, which makes generalization difficult. Rogers's adoption model is one of several hierarchy of effects models that assume similar linear approaches to how to promote new ideas, although the number of steps and the labels for the stages in each model vary.

Implications for Public Relations

Diffusion theory and the adoption of innovations has been used extensively as a theoretical framework in various closely aligned fields, such as health communication, but only has received limited attention in public relations research, mostly because of the field's recent focus on relationship building and maintenance (versus its role in the promotion of change and change management). However, when segmenting publics, innovators might be compared to active publics, while early majority and late majority groups might be considered analogous to aware and latent publics.

Most of the application of the model in the field has dealt with (a) the diffusion of public relations research within the field and (b) with the adoption of new practices (especially new technologies) by practitioners in the United States and globally. Nonetheless, Rogers's ideas about diffusion and adoption of innovation provide several useful ideas for practitioners as they develop strategies for public relations programs and campaigns. These include the following:

- The importance of stressing characteristics of innovations that increase the probability of adoption
- The importance of prior conditions and characteristics of the adopter; not all adopters are alike
- The importance of creating a critical mass of adopters, particularly by segmenting innovators and early adopters
- Recognition of public relations practitioners as change agents on behalf of their clients

DIRECT MAIL/DIRECT EMAIL

Direct mail has long been a popular form of communicating with audiences and is today going increasingly online as direct email. It is reported that Benjamin Franklin used direct mail as early as 1744 to inform potential buyers of books he had for sale. Public relations practitioners use direct mail methods to reach not only existing and potential customers but also to communicate with donors, volunteers, voters, investors, and myriad other audiences. For example, practitioners may want to distribute newsletters to consumers of specific products; provide notices of public government or school meetings; solicit donations for civic, health, and humanitarian causes; send financial reports to potential investors; enlist support for a political issue, cause, or candidate; or contact consumers about a special promotion or product recall. Many direct mail pieces employ emotional appeals to help engage audiences and keep them reading.

Whether disseminated via the postal system, email, statement stuffers, “take-one” display racks, or as newspaper, magazine, or package inserts, direct mail is the most prevalent form of direct marketing communications. However, according to the Direct Marketing Association (DMA), which has been monitoring response rates for direct marketing campaigns since 2003 and now includes transactional data related to email and online display ads, response rates to direct mail campaigns have dropped nearly 25% during the past decade. Although their 2012 Response Rate Report noted a higher response rate for traditional direct mail than email, the low costs associated with email gave it the highest return on investment (ROI).

Direct mail’s advantage is that it gives communicators a way to tailor and personalize messages in mass and deliver them directly to the specific audiences they want to reach. Typically, internally produced, or “house” lists of names, tend to be the most effective at securing responses, as these people have already been engaged with the organization. “Response” lists include people who have interacted with organizations similar to yours, while “compiled” lists, typically the least effective type, are put together by third-party vendors. Research is critical for identifying the target audiences an organization wants to reach, for compiled lists can be made up of people with very specific demographics, psychographics, income levels, zip codes, hobbies, past purchases, Internet search histories, professional associations, health problems, reading preferences, household type, voter registration, credit history, charitable contributions, pet ownership, and nearly any other documented characteristic or combination thereof. Lists are typically priced on a cost-per-thousand (CPM) basis, with an average rental list of 1,000 names priced around \$50 for one-time use. However, prices can be much cheaper or more expensive depending on the desired audience.

The mailing list industry includes list owners, list brokers, list managers, list compilers, and service bureaus, which support the maintenance and exchange of lists and related databases. Some online direct mail service providers can offer everything from list creation derived from tens of thousands of mailing lists, to message dissemination, to invoice creation for responders, to response tracking over time. Other companies can develop specific automatic electronic mailing list servers that can be used

by organizations for longer term use with designated audiences.

This capacity for audience specificity, computerized personalization, sophisticated evaluation methods, and the cost-effective nature of email in particular combine to make direct mail an attractive communication tool. Traditional direct mail packages typically include such elements as a personalized mail envelope; a personalized letter with an appeal and call to action; various response contact options (e.g., postage-paid return mail, toll-free number, and website); an informational brochure, fact sheet, or pamphlet; and a chit, which is an additional piece of paper or card that highlights a special offer, gift, or additional information. Electronic appeals often include links to purchase, donate, share information via social media, or learn more, as well as opt-in opportunities for newsletters, RSS feeds, and other promotional or news updates.

DISCOURSE OF RENEWAL THEORY

Discourse of renewal theory (DRT) describes, explains, and prescribes how crisis communication should emphasize learning, growth, ethical communication, transformation, and opportunity. The theory suggests that, although crises are often characterized as threatening, there is opportunity inherent to these events. Public relations practitioners play a key role in determining whether the communication following a crisis is characterized by a response to the threat or the opportunity. The

DRT shines light on communication choices regarding how a crisis will be resolved, the amount and level of information stakeholders will receive, as well as the trajectory of the crisis.

Underpinnings

Robert R. Ulmer, in his examination of a 1995 plant fire at Malden Mills in Lawrence, Massachusetts, described crisis communication that was less focused on apologia or image restoration and more on positive values and stakeholder relationships. Malden Mills was found to be able to renew, transform, and grow following its crisis. In 2002, Matthew W. Seeger and Ulmer built upon the Malden Mills case and analyzed another plant fire in 1998 at Cole Hardwoods located in Logansport, Indiana, to dig deeper into the role of renewal in crisis communication. Consistent with Malden Mills, the authors identified commitment to rebuild and to the interests of stakeholders as renewal. These cases provided theoretical and practical implications for the theory, including deemphasizing cause, blame, and responsibility in favor of positive stakeholder relationships and values designed to renew, grow, and transform the organization. Ultimately, Ulmer, Timothy L. Sellnow, and Seeger (2011) described the discourse of renewal theory as comprised of four objectives: organizational learning, ethical communication, a prospective vision, and organizational rhetoric. Each of these objectives is discussed in the following section.

Objectives

Crises are essentially failures. To meet the objective of organizational learning, public relations professionals must acknowledge the organization's role in the crisis and explain what it learned from the event. Without addressing learning, stakeholders affected by the crisis will not have the confidence in the organization to move forward. In this case, communication about learning is closely associated with renewal, growth, and transformation.

The second objective of DRT, ethical crisis communication, features openness and honesty. Any crisis communication that emphasizes withholding facts, spinning the truth, or obscuring information would not meet the standards of ethical communication and ultimately would prohibit renewal.

The third objective, a prospective vision, suggests that public relations professionals should create a vision for moving the organization or community forward following the crisis. This crisis communication should emphasize the opportunities inherent to the crisis and ways to transform the current state of the organization or community for the better.

Finally, organizational rhetoric refers to both internal and external organizational communication. Internally, DRT suggests coordinating and sharing ideas effectively. Externally, organizational rhetoric refers to crisis communication that is infused with hope and a commitment to overcoming the crisis.

Applications

Discourse of renewal theory has been used to describe examples of success and failure in crisis communication beyond the initial cases of Malden Mills and Cole Hardwoods. For instance, in 2002, Ulmer and Sellnow examined the public discourse following the terrorist attacks of September 11, 2001, as an example of renewal, growth, and transformation. They found that cooperation, positive values, learning, and a prospective vision were central to the discourse following 9/11. In 2005, Seeger, Ulmer, Julie M. Novak, and Sellnow examined the crisis communication of CEO Howard Lutnick after his organization, Cantor Fitzgerald, was destroyed during the 9/11 terrorist attacks on New York's World Trade Center where his organization was located. Lutnick was able to generate renewal by focusing on rebuilding the organization based upon the values of honoring those employees who lost their lives and to financially support the families of those employees.

Ulmer, Sellnow, and Seeger (2009) examined crisis communication responses to Hurricane Katrina in 2005 and the 1997 North Dakota floods. The authors found stark differences between the cases, with the community of North Dakota better able to generate renewal than the communities impacted by Hurricane Katrina. The North Dakota communities were able to accomplish renewal by emphasizing cooperation, learning, ethical communication, and sound organization rhetoric. Finally, in 2011, Shari R. Veil, Sellnow, and Megan Heald examined the Oklahoma City Memorial as a symbol of renewal for moving past

a crisis (in this case, the 1995 bombing of the Alfred P. Murrah Federal Building). They argued that shared values, learning, and optimism were practical steps for public relations practitioners to create renewal through the memorializing process.

DISCOURSE THEORY AND ANALYSIS

There are numerous strands of discourse theory, each offering a competing definition and focus of study. The two principal strands comprise linguistically oriented theories and socially oriented

theories. These two strands can in turn be divided between those theorists who take a critical approach and those who do not. For the field of public relations, the most promising school of discourse theory in terms of its application to the field's objects of study is to be found in the area of *critical discourse analysis* (CDA). CDA draws upon both linguistic and social theory and, as the name suggests, is critical in its perspective.

CDA is the application of critical theory to discourse and the creation of new critical theory relevant to discourse. It involves the analysis of texts in their sociocultural context. It may be distinguished from noncritical forms of discourse analysis by its inclusion of the concept of power as a central analytical lens. CDA involves a detailed examination and description of discourse, but it also moves beyond description in attempting to explain social phenomena. It is the explanatory dimension of CDA that distinguishes it from other, noncritical forms of discourse analysis. It is also this explanatory dimension that renders CDA a useful tool for both the analysis and conduct of public relations practice.

According to Norman Fairclough, there are three elements to CDA. The first element is a focus on texts. Initially, within CDA, texts were viewed as written language, including transcripts of spoken language. However, there has been increasing emphasis within CDA upon other elements of text, such as pictures and sound. Although the primary focus remains upon language, these additional elements are now routinely included in the analysis of texts. There are numerous established methods for textual analysis, including both quantitative and qualitative approaches. There are also computer programs such as NUDIST that assist with the organization of qualitative data. These programs are particularly suited for research projects involving large texts or large numbers of texts. The selection of a method is guided by the objectives of the study. For example, Fairclough favors close textual analysis derived from linguistics, which enables a detailed deconstruction of texts.

The second element of CDA is the analysis of the discursive practices associated with the production, distribution, and interpretation of texts. These practices may be institutional, social, and personal. For example, the sending of a birthday card may be a personal interaction, but it may also be an institutional interaction between a business

and its clients. The creation of the card message may involve a professional writer and a manufacturer who then distributes the card through retailers. Alternatively the card may be created by a child and personally handed to a parent. These alternative discourse practices are central to the meaning that is then derived from the card by its recipient. Discourse practices, then, actively contribute to the production of meaning.

The third element of CDA is the analysis of the sociocultural practices that provide the context for the discourse practices associated with texts. This element of CDA draws on critical social theory for its analytical frameworks. Louis Althusser, Michel Foucault, Antonio Gramsci, and Stuart Hall are some of the major social theorists whose work underpins critical discourse theory generally and CDA in particular. From Althusser, CDA derives the view that ideas can circulate within society and ideologies can operate in ways that are relatively independent of the economic base of that society. Thus, when public relations practitioners attempt to change the way an idea or activity is perceived, they are demonstrating an Althusserian approach to the production of ideas.

Foucault's rich body of work can be seen as part of the foundations of CDA. The view that power and knowledge are closely interrelated concepts, with each contributing to the formation of the other, is Foucauldian. The traditional axiom has been that knowledge is power. To this Foucault added that power is also knowledge and that the two concepts should be considered together. That is, what is to count as knowledge or truth in a society is to a large extent determined by those with power. In turn, that knowledge supports and enhances the powerful. Judges determine guilt or innocence on the basis of precedent established by other judges. Psychiatrists separate the sane from the insane on the basis of guidelines established by other psychiatrists. In both cases, the canon of knowledge is a source of their power, and yet they are also the sources of that canon because of their position of power. A central goal of much public relations work is to establish the legitimacy of particular institutions or actors in relation to areas of knowledge and, in the process, enhance their power.

Foucault also challenged the idea that language is simply a reflection of reality. To this descriptive function, Foucault added the prescriptive notion that the world—including the social world—is

constituted within discourse. Thus in speaking about the world in different ways, we can transform the world as we know it, or we can maintain the status quo. Again, this Foucauldian view underpins any public relations practice that attempts to reframe the way in which events, activities, or objects are viewed. Thus, for example, a ban on smoking in the workplace to protect people from the effects of passive smoking may be reframed as an attack on personal freedom. In attempting to change the discourse, such campaigns aim to change the way in which people think and act.

Gramsci's primary contribution to CDA is the concept of *hegemony*. Hegemony refers to power over society exercised through the dominance of particular ideas, theories, or ideologies. When an idea is so commonly accepted in society that questioning it positions the questioner on the fringes of society, it can be said to be hegemonic. For example, the belief in democracy could be said to be hegemonic in Western countries. Hegemonic ideas are those that are simply taken for granted and thus provide solid starting points for any new position that is seeking legitimacy. They are supported by the dominant institutions within a society, which means that to challenge hegemonic ideas is to challenge the interests of dominant institutions and potentially the entire social, political, and economic structure of a nation.

Stuart Hall, the leading theorist of the cultural studies school of thought, is in some ways similar to Foucault in terms of the significance and breadth of contributions that he has made to CDA and to social theory generally. Hall's 1988 work on effecting change within dominant discourses is, perhaps, the most important both for CDA and for public relations. Central to Hall's analysis of the shift in the United Kingdom from the Keynesian economic paradigm to Thatcherism was the concept of *articulation*. This concept refers to the way in which words may become linked to certain meanings and then shifted and attached to other meanings. Hall explored the limits of such articulations and concluded that though some elements of language are relatively free floating, others are held in place by social, economic, or political forces. An understanding of the concept of articulation is essential for any sophisticated practice of public relations.

CDA was introduced to the field of public relations scholarship in 1996 by an article in *Public Relations Review* by Judy Motion and Shirley

Leitch. This article positioned public relations practitioners as active participants in discursive struggles over sociocultural change. It demonstrated the application of many of the key concepts of CDA, which have been discussed above, in the day-to-day practice of public relations. Public relations practitioners were shown to be actively engaged in changing society through their work in transforming discourse. Since 1996, CDA has emerged as a new paradigm for the conduct of public relations research. CDA can be used to critique public relations practice, and it is particularly useful in teasing out power relationships when multiple stakeholders are involved. CDA also provides a significant toolbox for the research, design, and implementation of public relations campaigns.

examine the roles of gender, race, ethnicity, and sexual preference on practitioner experiences and perceptions of organizational discrimination.

As an issue of gender, the glass ceiling is a subtle but powerful barrier that prevents women in organizations from escalating into the upper management hierarchy. Lack of mentoring, gender stereotypes, and appropriate selection and recruitment, as well as leadership perceptions of certain groups, blend to form the obstacle course that keep women out of management.

Among the earliest studies to examine gender issues in public relations were the Velvet Ghetto studies. This research found that women were limited to lower organizational ranks due to societal and organizational socialization. Female practitioners experienced tension between their roles—a career professional, a mother, a wife, and a supervisor. Women opted for the technician role, carving out a clearer path of nonexecutive duties and responsibilities “because of societal expectations that women be ‘less managerial’—less serious-minded, less aggressive, and less likely to be part of the ‘good old boys’” (L. A. Grunig, Toth, & Hon, 2001, p. 262). According to Brenda J. Wrigley (2002), when faced with the glass ceiling, women devised “negotiated resignation” strategies that allowed them to justify the existence of those structural barriers or demote the perceived impact of the glass ceiling’s limitations on their careers. The refusal to confront the structure meant that a woman turned the blame inward, placing the burden of blame “on herself, on a lack of experience or credentials, or not working hard enough. The structure is not questioned” (p. 43).

Scholars believe that feminization of the field leads to decreased prestige for the field and lowered salaries for practitioners. Income gaps between male and female practitioners have been documented since the 1980s. The seminal Velvet Ghetto studies found that female practitioners did not have comparable negotiation skills, which would help them gain higher salaries and full value as workers. The gap remains as Bey-Ling Sha and David M. Dozier (2010) found after controlling for professional experience; women were still earning less than male practitioners.

Pigeonholing is another concern. That includes, in the case of African Americans for instance, being hired into a stereotypical role especially to fill a hiring quota. Such practices, as investigated by

DISCRIMINATION IN PUBLIC RELATIONS

Discrimination and its effects on the public relations workforce are concerns of scholars who

Marilyn Kern-Foxworth (1989) and other academics, often result in limited upward mobility and less access to decision-making power as well as relegation to functionary positions. Pigeonholing often results from being limited to working on race-related projects.

Although pigeonholing can take several forms, the practice of pigeonholing creates organizational tokens who are there for show, are there to handle certain audiences based on the plans of others, and who do not have any policy-making authority. Hispanic and Asian American practitioners often experience the “gap-filling model” of public relations. As gap fillers, these practitioners are selected and assigned to work with specific publics that are demographically similar to the practitioner. Asian or Asian American practitioners may well be hired to communicate solely with their ethnic or racial group; their capacity in the organizations is limited to certain duties such as interpreting or translating. Even if these practitioners want to stop or limit their gap-filling duties and move into another position, they cannot because of the organization’s need and expectations for them to be cultural interpreters.

Current research has shown that the practice of pigeonholing is not a perceived reality in the experiences of nonmajority and minority public relations practitioners. For example, practitioners investigated in Natalie Tindall’s (2009) and Rochelle Tillery-Larkin’s (1999) projects did not perceive any pigeonholing. In fact, practitioners were in managerial, decision-making, and authority positions and shifted between mainstream and niche audience accounts and campaigns. As Tillery-Larkin concluded, “They were satisfied with their jobs and were working on mainstream projects. Further, those who did work on race-related projects had created a niche in which they enjoyed doing so” (p. 241).

Although research on lesbian, gay, bisexual, and transgender (LGBT) practitioners is scant, research from Tindall and Richard Waters has shown that this group of practitioners experiences some discrimination, including sexual harassment and the lavender ceiling. For LGBT practitioners, the lavender ceiling may stop practitioners’ mobility into the managerial ranks. The lavender ceiling is the erected barriers—both perceived and actual—that hinder advancement

of LGBT individuals into management and leadership positions.

DISCURSIVE TECHNOLOGY

Discursive technology refers to communication expertise focused on maintaining or transforming established social, economic, political, and cultural practices and power relations in organizations, social groups and institutions, or society at large. Judy Motion and Shirley Leitch (1996) featured the concept as part of the argument for applying critical discourse analysis (CDA) as a theoretical approach to examining the role of public relations in society. In this approach, practitioners are seen as discourse technologists, whose technical skills, such as research, campaign planning, message design, and issue framing, are deployed to maintain or transform discourses.

Public relations as discursive technology follows the critical thought developed by Michel Foucault and Norman Fairclough, two of the key figures in the field of CDA. Discourse is understood here as a form of social practice. Discourse refers to the view that the use of language in social contexts necessarily either reproduces established power relations and accepted regimes of truth (and knowledge) or challenges and resists them. Any instance of communication can be seen as an act of strategic engagement with the social world through representations of the world, social relations, and

identities that are embedded in language. Critical discourse analysis recognizes that discourse is a mechanism for social domination and sets out to reveal how power and inequality are produced and reproduced through language.

Applying this approach to public relations has implications for how the practice is conceptualized as well as the type of topics chosen for scholarly investigation. At the theoretical level, established approaches to public relations built around concepts of propaganda, persuasion, two-way symmetrical communication, and the liberal democratic notion of the marketplace of ideas (an open public space where ideas can be publicly tested through debate) are problematized by the Foucauldian understanding of discourse. Kay Weaver, Judy Motion, and Juliet Roper (2006) articulated key points on which the discursive technology position is built.

First, behavioristic models of communication effects that underpin theories of persuasion do not fully explain public response to messages because they ignore the way in which language or discourse creates what can be perceived as rational and legitimate. Second, the notion fundamental to discussions of propaganda that truth exists outside language or discourse is shown as untenable; consequently, substantive distinctions between public relations and propaganda are obliterated. Third, accepting the Foucauldian conception of power both an oppressive and a positive, productive force offers public relations theory a more satisfactory insight into the way language use resonates simultaneously across individual, institutional, and societal levels. That communication or discourse is a strategic site for both domination and resistance is highlighted by proponents of the discursive approach as key to public relations inquiry and practice and also in global and international contexts.

DIVERSITY: AUDIENCES

Diversity means many things to many people: age, race, religion, ethnicity, education, gender. But these characteristics merely scratch the surface. Diversity goes far beyond that of a demographic profile. Even bringing psychographic traits, personal attitudes and opinions into the conversation does not demonstrate the depth and breadth diversity represents. In fact, within the perspective of public relations, diversity is so much more than just the identification of groups of people. Further, it is more than just an analysis of audiences. Public relations management allows these distinctive voices to be represented among a very cluttered marketplace of ideas. Said another way, public relations aids in providing society with various points of view so that citizens can make sound decisions based on more than just one perspective. And today, with the onset of the Internet and social media, these myriad voices can be projected all over the world. However, diversity is not a stand-alone concept and cannot be discussed without acknowledging intercultural communication—especially when it comes to public relations.

Similar to the argument that one cannot not communicate, Edward Hall made a simple, yet profound statement in 1959 in his groundbreaking book, *Silent Language*, explaining that culture is communication and communication is culture. Larry Samovar, Richard Porter, Edwin McDaniel, and Carolyn Roy (2013) defined intercultural communication as messages designed by someone from one culture for consumption by someone representing

another culture. This kind of communication occurs when people of different cultures come together and exchange communication—regardless of its type (verbal, nonverbal, etc.). As such, public relations practitioners have an opportunity to paint a very colorful canvas when creating this portrait called “diversity.”

Diversity and External Audiences

From an external relations standpoint, there is no denying that culture plays a large part in influencing behavior and encouraging diversity in today’s marketplace. Illustrated by a propensity for more multiculturalism—ranging from diverse food and fashion, music, travel, and architecture, to name but a few examples—organizations continue to rely on public relations management strategies and tactics to connect their key publics with products and services they provide. Some may even argue that it is the multiplicity among consumers themselves that is driving this culturally diverse economy. For example, think about the endless list of subcultures (aka microcultures) that exist.

Defined as a division of a culture within a culture, these enclaves or “pockets of people” personify the true spirit of diversity. From American gypsies and mothers of toddlers in tiaras to gluten-free, Generation Jones, and hipsters, there is no denying the important role public relations plays in communicating carefully constructed messages, by means of explicit information channels, to these unique and varied publics.

To further substantiate the importance of diversity, think about how age cohorts vary. Millennials (born 1981–1992), generation Xers (born 1965–1980), baby boomers (born 1946–1964), and the silent generation (born 1928–1945) have all experienced life through a unique lens. According to Pew Center researchers, this generation sensation is a result of three overlapping processes: lifecycle effects, period events, and cohort effects. In particular, period events (e.g., major events like wars, social movements, economic pressures, technological advancements) and trends influence young adults while they are still developing their “core values.” As a result, each age cohort has its own distinct personality. While millennials are often coined “digital immigrants and digital natives” who have cut their teeth on technology, baby

boomers have made their mark as individualists who work hard and play hard and defy ageism; gen Xers value diversity and adversity—having grown up during turbulent economic conditions. Members of the silent generation were raised during a time period of conservatism and self-sacrifice. Some demographers refer to these generational cohort differences as a “generational divide” where generations tend to collide.

Diversity and Internal Relations

From an internal relations standpoint, developing and maintaining relationships between employees and employers also have implications with regard to diversity. Using ethnicity as a mainstream example to substantiate the importance of diversity as a growth factor, consider the following results, reported by The Futures Company, an international market research firm: ethnic consumers drove 98% of growth in urban areas from 2000 to 2010 and 92% of the nation’s growth overall. Hispanics alone made up 56%. Over the next five years, the buying power of both Hispanics and Asian Americans is expected to grow by 42%, versus 22% for non-Hispanic Whites. From 2010 to 2050, the African American population is projected to grow by 47.9%; Hispanics, by 163.0%; Asian Americans, by 130.3%; and non-Hispanic Whites by 3.3%. What these figures illustrate is that intercultural communication—and being able to understand and communicate with diverse publics (e.g., employees)—is swiftly becoming commonplace criteria for providing a healthy, successful, and productive work environment.

For public relations practitioners, diversity is much more than just a term that encourages multiculturalism and intercultural communication. It is a way of life—a commitment to enabling many voices to be heard—no matter how softly they may speak.

DIVERSITY: PUBLIC RELATIONS PROFESSION

Diversity is usually used to refer to the mix of gender, race and ethnicity, age, sexuality, religion, or other aspects of identity across a particular population. Diversity studies address the underrepresentation of particular populations, the overrepresentation of others, and the effects these have on their power and experience. In the United States, diversity issues are shaped by the history of the civil rights movement; while historically Black American populations were the focus of research, more recently there has been greater recognition of the discrimination faced by Hispanic and other minority communities. In the United Kingdom, there is a substantial heritage of diversity research in organizations stemming from the 1970s, when equality legislation was introduced. In early research, the tendency was to quantify diversity and examine policies and processes that were resulting in discrimination. As the field has become more sophisticated, more work has been done on the *experiences* of people from all kinds of minority populations, rather than simply their representation in the workforce. This has contributed to our understanding of why people from minority backgrounds can still be underrepresented even when policy and process ostensibly treat them equally with members of a majority group.

Diversity in public relations has become a concern that exercises the minds of professionals and researchers, becoming more important as minority audiences have become wealthier, representing a

valuable target market. This is because professionals tend to be White, middle class, and able bodied—and therefore not representative of the wider population. Professional associations have taken this seriously: in the United States, the Public Relations Society of America (PRSA) provides diversity resources on its website and from 2006 to 2009 one of the largest global consultancies, Hill & Knowlton, sponsored an annual diversity survey, which was in turn well publicized by industry magazine *PRWeek*. In the United Kingdom, the two main industry associations, the Chartered Institute for Public Relations and the Public Relations Consultants Association, both initiated diversity working parties in 2011 and continue to express their support for an inclusive profession. The year 2011 also saw the first major survey of the industry that collected data on the ethnic make-up of the profession. Some U.K.-based consultancies have also initiated specific programs to reach out to more diverse candidates. In the United States, Black practitioners have their own National Black Public Relations Society while in the United Kingdom, a networking group has been set up to promote the benefits of cultural diversity in the profession.

Research on diversity in public relations originally followed the pattern of quantifying numbers of minorities, to explore the extent to which the makeup of the professional body encompasses enough variety to adequately address the wide range of audiences addressed by public relations campaigns. This notion of “requisite variety” continues to prompt both quantitative and qualitative work. Quantitative work seeks to establish the scale of the issue and has underpinned calls by academics to increase the number of practitioners from minority backgrounds. However, it has also been criticized as unrealistic: taken to its extreme, the principle of requisite variety—to match the public relations professionals in an organization with the range of audiences it is trying to target—is impossible to achieve. It is also essentialist, in that it reifies specific aspects of identity (e.g., race, sexuality) while ignoring the ways in which other aspects also shape behavior, attitudes, and values (e.g., class, professional background, gender).

Qualitative work on diversity addresses this matter to some extent, in that it has attempted to access the experiences of practitioners in minority positions in the profession (most commonly, Black,

Hispanic, and other minority ethnic practitioners), in the process revealing their intersectional identities, where privilege and disadvantage play a role in shaping their professional lives. This work has consistently revealed that, even when practitioners have reached a high level of seniority, their career trajectories and workplace experiences have been marked by the experience of being different from the occupational norm, resulting in exclusion from networking opportunities, barriers to career progression, and tokenistic deployment (e.g., assignment to an “ethnic public relations” campaign in the absence of any relevant professional experience), among other things. The findings demonstrate that diversity in public relations is not only about numbers, but also about the experience of difference on a day-to-day basis.

Some researchers have also explored the nature of diversity among audiences, the ways in which public relations campaigns address those audiences, the presence of diversity issues in the public relations curriculum, and the dominance of White, western norms in the profession. Here, the lack of diversity in public relations is seen to result in a blinkered approach to communication that fails to accommodate the demands of a culturally diverse world.

There is some theoretical variety in the approaches to diversity taken in public relations. For example, Debashish Munshi has used postcolonial theory to examine the position of minority groups as the “other,” exploring their experiences of visibility and access to “voice” both as practitioners and as publics. Other researchers have called for more integration of intersectionality theory into public relations, including to notions of identity among publics, demonstrating the shortcomings associated with campaigns that only address people in terms of one aspect of their lives.

It is important to note that diversity is frequently interpreted as relating to race or ethnicity, but it encompasses far more groups than this. Gender is clearly important, and relatively few studies have been carried out on the gender composition of the profession where men are the minority group. Sexuality is another neglected area; in 2013 a book on lesbian, gay, bisexual, and transgender perspectives of strategic communication was published, the first of its kind. Other important aspects of identity that could shape experience as a public relations

professional, such as disability and religion, have still to be addressed at the time of writing.

DOUBLESPEAK

Doublespeak is language that is strategically chosen to distort or obscure reality. It is often associated with misleading advertising claims, unethical politicians, and public relations "spin doctors," who use language to frame a subject in the most positive light. When doublespeak is exposed, it may generate public distrust and be counterproductive to long-term public relations goals.

William Lutz (1989) identified four types of doublespeak: euphemisms, jargon, "bureaucratese," and inflated language. Euphemism is language that sugarcoats negative or unpleasant realities. For example, people have their pets "put to sleep," an overweight boy is "husky" rather than fat, and a down payment is "an initial investment." Jargon is specialized language that may be unique to a particular industry, occupation, or social group. It may be used to intentionally obscure meaning for those who are outside the group. For example, the term *collateral damage* has been used to describe the deaths of innocent civilians in wartime. Lutz wrote that sewage sludge may be labeled "regulated organic nutrients" (1997, n.p.). Bureaucratese is characterized by the combination of jargon with lengthy, wandering sentences that attempt to conceal the truth or confuse the listener. This type of doublespeak may be used by officials who wish to appear to be answering a question or addressing an issue, but who are in fact revealing nothing. Inflated language is intended to make the ordinary seem extraordinary. A common tactic is renaming. Store clerks may become "sales associates," beauty parlors "day spas," and college home economics programs "family and consumer science" majors. Sometimes doublespeak is introduced so successfully that the terms become accepted as the appropriate, standard terms to use.

Doublespeak is often associated with *newspeak*, as coined by George Orwell in his 1949

novel, 1984, in which a fictional government attempts to control public thought through the manipulation of language. However, Orwell did not use the term *doublespeak*. The term entered the popular vocabulary in the United States in the early 1970s as antiwar sentiment spurred challenges to government characterizations of the Vietnam War. In 1972, the National Council of Teachers of English created a Committee on Public Doublespeak to expose the misuse of language by government, military, and corporate officials. The committee began publishing a newsletter in 1974 that eventually became the *Quarterly Review of Doublespeak*. Although the newsletter ceased publication after more than 20 years, the committee continues to present an annual Doublespeak Award for “language that is grossly deceptive, evasive, euphemistic, confusing or self-contradictory and which has pernicious social or political consequences” (National Council of Teachers of English, 2003). Recent awards have gone to the tobacco industry (2000), the Department of Defense (2001), and a state school system that removed references to Judaism from a literary work about Jewish life in Europe (2002).

Scholars of doublespeak agree that the growth of mass media, advertising, and public relations has contributed to the ubiquitous presence of doublespeak. In particular, demands from news media for spokesperson accessibility and quick public comment may lead pressured officials to resort to doublespeak.

Although most scholars denounce the use of doublespeak, it has been noted that intentional ambiguity may be helpful to organizations confronted by multiple challenges in turbulent environments. “Strategic ambiguity” (1984), according to Eric Eisenberg, strikes a balance among being understood, not offending others, and maintaining one’s self-image. He contends that by employing vague, ambiguous, equivocal communication, organizations may avoid creating factions and smooth the path for organizational change. Whether the strategy is ethical, Eisenberg notes, depends on the goals of the communicator.

DRAMATISM AND DRAMATISM THEORY

Conventional rhetorical theory tends to focus attention on how discourse influences the way people think. Formulated by Kenneth Burke, dramatism adds depth to rhetorical theory. It provides insights into how language and its connections to thought can be studied as modes of action rather than ways of conveying information. Thus, Burke devoted his massive study of language and society to the analysis of symbolic action, based on his proposition that “language is primarily a species of action, or expression of attitudes, rather than an instrument of definition” (1968, p. 447).

In his early years in the 1920s and 1930s as a literary critic, Burke began to create his theory of dramatism to assist his ability to perform insightful literary criticism. Burke began his career as a literary critic but soon expanded that interest to analyze and critique all discourse, especially that which leads to cooperation and competition in society. This evolution saw his influence grow beyond literary criticism to social criticism. He influenced the thinking of scholars in literature, rhetorical theory, sociology, history, communication, and political science, for instance. His theory of dramatism allowed him to offer some of the richest existing critiques of how the free market system can work to the advantage of some while disadvantaging others.

In this context, Burke revealed how the term *progress* can be the guiding light for a society. Any act can be done in the name of progress. Such commitment, he reasoned, was often at the heart of the conflict between business leaders and other groups, such as laborers and environmental activists. One group's progress might justify sacrifice on the part of another group.

This innovative contribution to literary criticism and social commentary began with a deep curiosity into the workings of the poet's, dramatist's, or novelist's mind. Burke was looking for a critical apparatus that would allow him to disclose the reason or motive behind the creation of any work of literature. He believed that it was necessary to unlock the bond between the writer and the reader, a special relationship in better literature. In better literature, readers and authors participate—act—together in the experience of literature. A work of literature does not report the feelings—hope, for instance—of the author. Rather, it evokes those feelings in the reader.

He noted early in his inquiry that a poem or other literary device is not a mere report. That is, the poet who feels joy at seeing nature—a tree, for instance—writes a poem not to report or convey knowledge about that tree, but to evoke a similar experience at enjoying the symbolic tree characterized in the poem. This line of thought led Burke to discount the element of communication by conveying knowledge—*epistemology*—as being less important than the creation of action—*ontology*. He argued that the reader does not interpret and respond to the poem as a report but as a symbolic experience—an act. The author, by this reasoning, wants the reader to participate in the experience rather than to receive a report of the experience.

By this logic, Burke argued that Hamlet's plight appealed, not because he reported his circumstances and feelings, but because Shakespeare was capable of having the audience share in the symbolic action of feeling betrayal and revenge. Attitude is the objective of literature, not knowledge gained by report.

Central to his theory of dramatism was the distinction between motion and action. A truck rolling down a hill is in motion. If a bystander decides to jump into the truck and bring it to a stop, that is action. Action is differentiated from motion by the intervention of moral choice and attitude. Motion

occurs without morality. Action is the essence of morality. For this reason, Burke believed he could shed light on the moral choices being made and advocated by the voices of society.

Because of his societal interests, Burke was able to reason that property is not a thing but an action. This conclusion is substantially relevant for the application of dramatism to public relations practice and ethical inquiry. In a capitalistic society such as the United States, much of the discourse of public relations is devoted to the promotion and defense of property. Promotion and publicity dramatize the joys of ownership and participation. It is not merely knowing that a new car line is now on the market; the sponsor of such discourse is not conveying information but inviting customers to participate in—enact—the joys of property ownership. Buying is action.

Activists are likely to elevate the concept of ownership beyond the limits of property to the privileges and responsibilities of society. Thus, if a business owns property, such as a coal mine, it can do what it wants with that property, including strip mining, according to one terminology. By the activists' interpretation of property, however, the mine is part of the total property of the nation, collectively owned. Thus, the business must act according to larger rather than smaller interests on matters of property ownership.

One of the key elements of dramatism is its awareness that words are propositional. The word *teacher* reports something about a person in that profession. More important, however, it is a command for specific action. People who share the symbolic substance *teacher* are expected to respond through action—to teach. Thus, fathers are supposed to father and mothers to mother. Preachers preach. Firefighters fight fires. Legislators legislate. Regulators regulate. Investors invest. Critics critique. Activists become active. In each case, the action implied or mandated in the role-based label goes beyond the informative report to a spirited motivation to action—to participate in the action or symbolic action.

Sigmund Freud gave Burke insights into the associational nature of words and the motives that came from those words. On social issues, Burke was prone to consider the guidance of Karl Marx, who suggested ways to disclose the hidden traps of action embedded in words. Some of the most

interesting sets of terms, Burke mused, were those associated with work and workers in the 1920s and 1930s. The symbolic action of labor and management, thus having implications for employee communication, can work out so that management is boss, giving direction and determining the limits of reward and the requirements of each job. Burke opposed asymmetrical relationships of this kind. Labor should participate in the definition and, therefore, the enactment of work and reward.

Burke reasoned that motives are shorthand terms for situation. The reasoning behind this conclusion is based on Burke's experience with a photography exhibit at an art show. He was fascinated by how a photographer could take different pictures of the same subject. By using differently colored lenses, the same subject could look unique in each photograph. From this experience, Burke reasoned that people see reality through terministic screens. In other words, as each different colored lens gives a unique view of reality, so does any terminology. Each terminology is a way of seeing uniquely and a way of acting uniquely. Terms, thus, prescribe actions. Words are not only natural, but they also add dimensions to nature. They characterize, define, and introduce attitudes into nature. Words mediate between nature and persons' minds.

As public relations practitioners, along with others, communicate about some product, service, or issue, they use words that invite the target of those messages to participate—act—in accord with the screen offered by the terminology. This kind of reasoning suggests why there is a clash between activists and corporate spokespersons. Activists call for the enactment of “environmental responsibility.” That action word challenges citizens to achieve some preferred state by acting responsibly toward the environment. Activists call for higher environmental standards by dramatizing the dire consequences of failing to do so. Companies respond with their facts and images of progress.

By this logic, Burke came to define *dramatism* for the *International Encyclopedia of Social Sciences* as “a method of analysis and corresponding critique of terminology as designed to show that the most direct route to the study of human relations and human motives is via a methodical inquiry into the cycles or clusters of terms and their functions” (1968, p. 445). He reasoned that terms become meaningful and motivational as

clusters. Each cluster focuses attention on a primary term that is modified by secondary terms. In a piece of discourse, a central term might be modified by defining terms as it is developed by an artist or some other advocate.

In the realm of public relations, the central term might be *purchase*. One rationale for public relations is to increase revenue through increased sales. Purchase is a motive. What is to be purchased? That is the product or service promoted. Ads offer excellent examples of such symbolic action. They show “satisfied customers” using the product. Soaps and creams moisturize, keeping skin healthy and young looking. The symbolic action here is the product as a fountain of youth. The car roaring across the countryside is freedom, power, and status. To buy is to participate—enact—those terms as terministic screens. Participation joins the interests of the consumer with the seller.

As Burke argued, dramatism deals with relationships. Is the relationship of buyer and seller, in these cases, one of mutual benefit? Is the terministic screen imbalanced in its implications for the participants? Does one party benefit disproportionately? Will it lead to cooperation or to competition, which can even foster buying from the competitor or seeking the services of a litigator? Each choice is an enactment of various conflicting or competing terminologies.

E

EASTERN EUROPE, PRACTICE OF PUBLIC RELATIONS IN

Eastern Europe refers to the eastern part of the European continent, though the term itself can be used in geopolitical or cultural contexts besides the geographical one. For decades, Eastern Europe was an ideological construct that was a synonym for the socialist countries of Europe during the Cold War. Eastern European countries are often referred to as transition countries because of their political, economic, and social transitions from a single-party political system toward a pluralistic society, and from a centrally planned economy toward a market economy. Countries of the region are at different stages of their transitions, as some are European Union (EU) and North Atlantic Treaty Organization (NATO) members and have reached the end of transition, whereas others are struggling with the establishment of democracy and market economy. The Czech Republic, Slovenia, Hungary, Slovakia, Poland, Estonia, Lithuania, Latvia, Romania, and Bulgaria are members of the EU while Albania, Belarus, Bosnia and Herzegovina, Croatia, Macedonia, Moldova, Montenegro, Russia, Serbia, and Ukraine are at earlier stages of their transitions. The latest independent country of the region is Kosovo, whose independence has not yet been recognized by several countries, dividing even the EU.

Public relations has played a vital role in the economic and social transition but public relation's role in the political transformation is dubious. The evolution and practice of public relations in Eastern

Europe has been described as "transitional public relations" that helped organizations adapt to the changes from a planned economy to free market economy. Although several scholars dismiss propaganda as a form of public relations, nevertheless propaganda is a heritage that has had an influence on the evolution and practice of public relations in the region.

During communism, governments and governmental organizations were discredited and dis-trusted as many officials and the political elite abused their positions. Not only in Russia but also in Ukraine and Poland, the notion of "Black PR" entered the vocabulary of political public relations in the 1990s, contributing to an overall negative image of the profession. Black PR refers to the manipulative and unethical political campaigning during elections with the aim of creating negative images of political rivals. Several books and websites in Russia are devoted to the theory and practice of Black PR. They detail strategies and tactics about fooling people, creating bad images of political rivals, lying about other candidates' plans and strategies, or reacting to rivals' actions. In some cases it has also been utilized in the corporate sector to discredit rivals.

Politics has a great influence on the practice of public relations in several Central and Eastern European countries. Many local consultancies have political affiliations, and public tenders and state contracts are won by these agencies rather than independent, international consultancies. So networks and links are often more important than professionalism. Informal clientelistic networks

are very strong in the region where political elites and the media are strongly linked. Media moguls and oligarchs own several media outlets to protect their own business interest. Media institutions can be linked to political and business interest, which in turn determines how the media are perceived as fitting into the clientelistic system (Örnebring, 2012).

According to the 2012 European Monitor, Eastern European practitioners experience ethical challenges in their everyday life more frequently than their colleagues in Western or Northern Europe. Practitioners have strong beliefs in national or international accreditation systems, which could contribute to the improvement of the profession's reputation.

The professionalization of public relations shows a diverse picture across the region as it is more professionalized in some countries than others (Sriramesh & Verčič, 2009). National associations are fully functional in most countries; however, after the initial booms in memberships during the 1990s, many associations struggle to keep memberships active by making it worthwhile to join these organizations. Public relations education has a very high standard in Eastern Europe, though in many countries it remains theoretically orientated rather than skills and practice based. Regional differences are prevalent in public relations literature, as some countries have very limited books on the subject in the local language while other countries can boast of dozens of books written by local authors. American standard textbooks have been translated into some languages. Some countries have launched monthly periodicals, but after a few years these journals disappeared but were revived as online magazines (e.g., *PR Herald* in Hungary or *piar.pl* in Poland).

After the accession to the European Union in 2004, the public relations sector of the Central European countries has become one of the fastest growing, though some markets are showing signs of saturation. The global financial crisis of the early 21st century hit hard the public relations sector of the region, where shrinking public relations budgets mean the lack of new business opportunities for consultancies and the loss of long-term clients.

The role of social media in public relations is widely recognized but not fully understood by

many Eastern European organizations. Specialized social media agencies tend to be more popular than standard consultancies, which often lag behind the latest know-how and developments of social media. Internet penetration is uneven in the region: in Estonia, for example, 80% of the population use the Internet and the entire country has the capacity for wireless Internet access while in neighboring Russia only 44% of the population use the Internet.

Corporate social responsibility (CSR) continues to be a hot issue in Central and Eastern Europe, which is characterized by weak civil societies. Multinational companies have played a leading role in introducing environmentally friendly technologies together with a new management culture that addresses social and environmental issues. Local companies often interpret CSR as philanthropy, sponsorship, or simply as a marketing tool.

More than two decades of experience coupled with a growing number of well-qualified practitioners have contributed to the growing professionalization and sophistication of the public relations industry in Central Europe. Some public relations agencies have specialized exclusively on the Eastern European market to develop communication strategies for the Central and Eastern European region as more and more clients demand a regional approach.

ECOLOGY AND PUBLIC RELATIONS

Ecology is the study of relationships that organisms have with each other and with their natural environments. Its development from the 19th century was strongly shaped by science-oriented subjects, especially biology and earth science. Since the mid-20th century, that orientation has been supplemented with human ecology, defined as the study of the—albeit largely destructive—effects of human behavior on natural systems. The study of human ecology has had the laudable aim of learning how to reduce or reverse ongoing planetary degradation. Ecological historians link the 20th century's growing awareness of planetary vulnerability through the arrival of atomic weapons and their capacity to make human life extinct; the human contamination of Earth's basic ecosystems resulting in the death of birds and the potential extinction of plants and other species reported in Rachel Carson's *Silent Spring* (1962); and the visible fragility of the blue Earth as photographed from space by astronauts.

In public relations, the main reactions to the growing environmentalist movement accompanying that perceptual shift vary across three main groups. The first group is practitioners concerned with environmental issues. They tend to fall into two opposing camps. On one side are the proenvironment activists who speak for the planet and its organisms and, sometimes, to give voice to the concerns of scientists attempting to track ecological risks and their likely impact on the earth. From Greenpeace to the World Wildlife Fund, these mainly amateur, but sometimes paid professional, practitioners make a case for prioritizing ecological issues from whale preservation to reducing nuclear power to lowering greenhouse emissions. On the other side are corporate practitioners whose employers stand accused of assaulting environmentalism and environmental activists through expensive lawsuits and a range of strategies designed to discredit them or their views. Such practitioners have been labeled merchants of doubt for selling uncertainty to a public lacking the expertise to understand sound science. They use persistent calls for levels of proof, which are underwritten by the research of small groups of corporate-funded scientists, beyond reasonable scientific doubt.

Corporate practitioners seek to influence opinion against proenvironment initiatives that have

cost implications for business and to influence publics in favor of weakening existing environmental legislation. Social critics from outside public relations offer fierce criticism of the field's activities in relation to the environment whether it is greenwashing by covering a tree-denuded landscape with green paint, or astroturfing, which replaces authentic grassroots groups by artificial groups created (and often paid for) by agencies, or downplaying the long-term effect (e.g., by running campaigns that suggest that the damage from BP's oil spills in the Gulf of Mexico in 2010 is over when the scientific jury is still out). Government practitioners can participate on both sides. They punish polluters and send a message that environmental damage is not acceptable yet downplay long-term effects in situations where their bosses may have degrees of culpability (e.g., the failure of the levees in Hurricane Katrina in 2005; the lack of well-developed and implemented drilling regulation prior to the 2010 BP Macondo well blowout).

The second group includes public relations academics. With the exception of issues, crisis, and risk management scholarship, ecology and the natural environment do not feature frequently or prominently in the public relations literature. Indeed, the use of the term *environment* itself is frequently restricted (e.g., in the excellence project and insider public relations histories) to the business or social environment rather than referring to, or including, the natural world. A few 21st-century scholars have argued that the field needs to take climate change on board as a potential megacatastrophe on a global scale and use public relations to engage with the business, ecological, and social dimensions of that threat in ways that might enhance rather than diminish the profession's social standing. They document direct links between the methods of the tobacco companies in denying the health risks of smoking and the denial of global warming. They contend that the antienvironmental lobby's future notoriety may exceed the severely damaging reputation costs of public relations support for the tobacco lobby, particularly if the environmental crisis denial industry diverts resources that could have been used to mitigate climate change (and its impacts) to answer demands for the establishment of further proof of global warming before taking preventive steps.

The third group consists of public relations educators. Ecology has evolved over time but is grounded in the study of the world around us and learning from that study to sustain that world. Ecological literacy, one of its recently emerging forms, connects with the work of Howard Gardner and 21st-century pedagogical searches for the kinds of minds needed for existing and future challenges. Both ecologists and educators seek to identify key intelligences and competencies. Ecological literacy, or how to foster learning that prepares people for the unprecedented environmental challenges of the contemporary world, is a clear contender. This new stage of ecology involves Daniel Goleman, who uses it not only to integrate his major work on emotional intelligence with his later work on social and ecological intelligence in an age of transparency, but also to offer a major upgrade in key contemporary skills. Ecology and public relations have had limited positive contacts, but linking them through education has enormous potential for transforming courses, students, and practitioners.

EDGAR ONLINE

EDGAR Online is an online subscription service (www.edgar-online.com) used to access a database of Securities and Exchange Commission (SEC) public filings. For a fee, investor relations and corporate public relations officers can gather financial information on their company and on similar, competitive companies using the EDGAR database. EDGAR Online, Inc. is listed on the National Association of Securities Dealers Automated Quotation (NASDAQ) under the symbol EDGR. Subscriptions are paid on a monthly or quarterly basis, and usage is limited to a certain number of documents per term, with an additional fee for each additional document accessed. The database may be searched by filing type, date of filing, company name, or person name. Though EDGAR Online is not affiliated with the SEC, it serves as a carrier of information from the SEC to the consumer.

EDGAR stands for Electronic Data Gathering, Analysis, and Retrieval. The SEC mandates that all publicly traded companies must file their annual, quarterly, and current reports, along with reports on stock sales among company executives (Form 144), with the SEC for review and public dissemination. The typical annual (10-K) or quarterly (10-Q) report includes financial statements, messages from the company's leadership, and information regarding company performance and future plans. Current reports (8-K) partially fulfill material disclosure requirements; they usually include press releases of updated information regarding changes of management, mergers, or acquisitions.

The EDGAR live filing system began on July 15, 1992. Originally documents were sent to the SEC by diskette or magnetic tape. With the introduction of computers, files could be sent via modem. They are now transmitted over the Internet via high-speed lines (T1 or ISDN) or FTP servers directly to the SEC. In 2001, the SEC began accepting transmissions of Hyper Text Markup Language (HTML) files, which show photos, graphics, and formatting. The documents that are filed with the SEC are later publicly disseminated through services such as EDGAR Online. Subscribers to EDGAR Online may be stockbrokers, analysts, shareholders, investment bankers, or others interested in timely information pertaining to public companies. This

subscription service, in addition to providing access to public company filings, offers international public company reports, normalized financial data for company comparisons, financial news, initial public offering (IPO) alerts, stock quotes, charts, and investor relations services. EDGAR Online also presents a full range of hosting, intranet, and Application Programming Interface solutions to bring public company filings onto company websites and news sites.

In addition, EDGAR Online offers a free service, Free EDGAR, which can be found at <http://www.freedgar.com>. Users of Free EDGAR must register with the site by supplying name, address, telephone number, email address, and occupation. Free EDGAR offers only the most basic access to filings and is meant for use by individuals. Only one free file can be viewed per day, but additional filings can be viewed for a fee. The one-filing-a-day limit allows EDGAR Online to offer a public service while answering the demand for its subscription service by professionals and serious stock researchers.

EDITING

The verb *edit* is defined in the *American Heritage Dictionary of the English Language* as follows:

1a. To prepare (written material) for publication or presentation, as by correcting, revising, or adapting. . . . c. To modify or adapt so as to make suitable or acceptable. 2. To supervise the publication of (a magazine, for example). (Dictionary.com, 2003, n.p.)

The word *editor* first came into use around 1712, and the French word *éditer* was established in 1784. By 1793, the word *edit* was connected with the publishing process (Dictionary.com, 2003, n.p.).

Today's public relations professionals use editing in many kinds of publications, including newspapers, newsletters, annual reports, brochures, and news releases.

In his article, "Protect Your R.E.P.! Revise, Edit, Proofread," Philip Vassallo stated that many

factors are involved in the writing process, among them editing. Editing corrects for good sentence structure, proper word and grammar usage, and correct spelling of words and people's names. One way to check written documents is by reading them aloud several times for errors.

The revising process is an important part of the editing process. No document is ever final. One must revise several times to improve one's work and make it less confusing and reader-friendly. This process is sometimes time consuming, but it has great payoffs.

Stylebooks such as *The Associated Press Stylebook and Briefing on Media Law* and *The Elements of Style* are helpful resources for editing. Both books deal with proper writing style and word usage. The importance of editing, revising, and rewriting are all explained in the stylebooks. They help guide writers in the right direction by showing them a simple, comprehensive way to produce their work. With careful editing, not only is writing easy to read, but it is more widely understood.

Public relations professionals know the importance of editing. Pieces such as annual reports, brochures, and proposals all require thorough editing before the final document is printed and read by the public.

Whether the writing job is big or small, editing is necessary. Although it often requires effort and time, it is a major part of the writing and publication process. No writer can assume that his or her work is accurate and error-free on the first draft. One should always carefully read one's work and correct errors. Using multiple editors is also a good tactic.

EDITOR AND PUBLISHER

Editor is a very broad title for people who work for organizations such as book publishers, newspapers, and magazines. Editors are usually distinguished by the particular function they oversee. Some examples of editorial titles are *executive editor*, *managing editor*, *copy editor*, *page editor*, *section editor*, *headline writer*, and *photo chief*. Generally editors set the editorial policy for their publication. They are responsible for determining issues such as the design, content, focus, and audience of the publication. Editors also make day-to-day decisions on what's important to readers, on content, and on ethics. They may ask questions of reporters and authors to strengthen their piece and check facts for accuracy. In addition, editors may rewrite parts of a piece or change the order of presentation to make it more readable and appealing. Some editors are involved in managerial decisions; for example, they may hire and fire personnel, and they may give input and sometimes final say on editorial budgets, including salaries, travel budgets, other expenses, and equipment budgets.

A *publisher* is typically the chief officer of a newspaper, magazine, or publication. This role is often determined by the nature of the publication. Publishers are the on-site authority for the organization; for example, they may set the editorial policy of the publication, including the political stance it favors. In newspapers, publishers typically reserve their editorial input for the opinion or editorial page, where writers tackle social and political issues affecting their communities. Often publishers oversee the fiscal health of the publication, thus serving the interests of a higher authority such as a newspaper chain, communications conglomerate, publishing company, or stockholders. Because these higher authorities want a return on their investment, the publisher must determine the best ways to produce a profit margin, to minimize or at least carefully control operating expenses, and to maximize market share and general revenue through such avenues as paid circulation, advertisements, commercial printing, and Internet subsidiaries. In general, publishers delegate editorial, advertising, and production oversight to subordinate editors and managers in each respective department, maintaining overall control by monitoring market share,

profit margins, revenues, operating expenses, and other factors. Publishers can also be ombudsmen and address public concerns; the "public" may include readers who question the content or display of a story, photograph, or headline; readers who want to praise the newspaper or magazine for its work; and readers who complain about everything from missed home deliveries to the opinions expressed by columnists. Often publishers become members of civic organizations and become involved in charities and sponsor local events. They often deem it essential to be visible in the communities they serve because of the widespread belief that the publication is a community business and therefore benefits from a healthy community.

Brigitta Brunner

EDITORIAL

An *editorial* is an article in a newspaper or magazine that presents the view of the editor or a guest columnist on a particular topic. The purpose of an editorial is to interpret, to advocate, or to entertain. Sometimes editorials are intended to persuade, and sometimes they are written to provide background on an issue so that readers may draw their own informed conclusion.

Editorializing is expressing an opinion. This is appropriate in editorials but not in news articles, in news releases, or in any unattributed statement. The news convention of objectivity requires that news articles and news releases limit their statements to reports or statements that are verifiable. For example, the statement "More than 50 people attended the library open house" is verifiable. In contrast, the statement "A lot of people attended the open house" is a judgment and an example of editorializing. An opinion does not belong in a news article or news release (written by a journalist or public relations practitioner, respectively) unless it is attributed to a source. (For example: "'A lot of people attended the open house,' said Ann Lee, director of the library.")

Editorials appear on the editorial page in newspapers, along with columns and letters to the editor, to distinguish them from news articles, which are intended to provide objective reports. They are

useful in stimulating readers to think and to reach conclusions. They also provide a personality to the newspaper, magazine, or organizational publication. In editorials, readers may find more than just the facts. As John McClelland, editor of the Longview, Washington, *Daily News* and past national president of Sigma Delta Chi (predecessor to the Society of Professional Journalists), said, "To have a personality a paper must have strong convictions and opinions. And it must support those opinions and convictions consistently" (Waldrop, 1955, p. 14).

Editorializing in a news release can be the kiss of death to good media relations. When busy editors receive news releases that include editorializing, they may discard them immediately and then in the future discard releases from the same organization even before opening them. When public relations practitioners write news releases, they should carefully avoid editorializing, or including unattributed opinions, to protect good relations and maintain credibility with news media editors.

When practitioners write columns and guest pieces submitted for a publication's editorial page, editorializing is fine. Editorializing has its place, but it is not in the news article or news release.

EFFICACY/SELF-EFFICACY

Efficacy is defined as the capabilities people have to produce an effect. Self-efficacy refers to how much people believe in their own capabilities to perform or complete tasks. Self-efficacy is different from self-esteem. While self-esteem is a general feeling of self-worth, self-efficacy is concerned

with the judgment of being capable of accomplishing a specific task or goal. Self-efficacy influences how people feel, think, act, and motivate themselves. When people have high self-efficacy with regard to a certain situation, they feel confident, facilitate cognitive processes, and motivate themselves to complete tasks by confronting challenges. When they have low self-efficacy, on the other hand, they reveal anxiety and helplessness and try to avoid difficult tasks. The concept of self-efficacy was introduced by Albert Bandura's social learning theory and social cognitive theory. The concept has been adopted in public relations practices especially with regard to health campaigns to explain and predict publics' responses to campaign messages. For instance, when health messages promote self-efficacy, publics are more likely to reveal a higher level of self-efficacy and enhanced efforts to manage threatening health situations.

Bandura proposed that there are four antecedents of self-efficacy: performance accomplishments, vicarious experience, verbal persuasion, and physiological cues. In other words, there are four ways of developing self-efficacy. First, people tend to have strong self-efficacy when they achieve accomplishments and are successful at tasks. Mastery experiences and successes build a strong sense of self-efficacy. If people experience a consistent pattern of success in performing tasks, then they will have a high degree of self-efficacy in approaching future accomplishments of the tasks. Second, through social modeling or vicarious experience, people strengthen their self-efficacy. When people observe others like themselves succeeding at tasks, they feel confident that they can complete the same tasks with desirable outcomes. Observing the failures of others, on the other hand, casts doubts about their ability to complete the same tasks. Third, through social persuasion, people's self-efficacy can be strengthened. When people are convinced by someone's verbal encouragement that they are capable of succeeding at tasks, they tend to have increased self-efficacy and exert more effort to complete tasks. Fourth, physical and emotional cues can be used to judge self-efficacy. People tend to perceive anxiety, tension, and depression as an emotional deficiency to perform tasks and also consider the lack of physical strength and stamina as indicators of physical deficiency. These physiological cues may affect the outcomes of the tasks.

People may perceive low self-efficacy when they are physically ill and feeling pain. Thus, mastery experiences (performance accomplishments), observing others to succeed at tasks (social modeling), having positive encouragement from persuaders, or relying on physical and emotional cues are required to develop a sense of self-efficacy.

The underlying attributes of self-efficacy include cognitive, affective, motivational, and selection processes. In other words, self-efficacy, or beliefs of personal efficacy, regulates human functioning through cognitive, affective, motivational, and selection processes. Much human behavior is regulated by forethought, which involves cognitive process. This cognitive process enables people to predict the occurrence of future events and develop the means of achieving their control over the events. People with high self-efficacy set challenges for themselves and visualize successful outcomes that provide guidelines for performance. The higher a person's self-efficacy, the higher the personal goals are set. Self-efficacy also influences the amount of stress, anxiety, and depression people experience in threatening situations. People with high self-efficacy tend to believe they can manage threats and lower emotional deficiency such as stress, anxiety, and depression by exercising control over the threats. This is another key impact that self-efficacy has on human functioning. In addition, self-efficacy plays an important role in the self-regulation of motivation. Human motivation is often generated by goal aspirations and the careful assessment of costs and benefits anticipated for courses of action. People with high self-efficacy are likely to motivate themselves as they seek to achieve goals and exert efforts to produce desirable outcomes. Finally, self-efficacy affects how people make choices about their activities and environments. Self-efficacy determines the kind of life people choose to live. People tend to avoid tasks they feel exceed their capabilities while pursuing those they feel competent to perform. Through selection processes, people can have control over possible outcomes. This means that people with high self-efficacy, thus, make choices to control their destinies through personal decisions and efforts. They approach difficult tasks as challenges to be mastered rather than dwelling on the potential negative consequences. When they fail,

they try to recover their self-assurance by exerting more efforts since they believe destiny is controlled by their personal decisions and efforts rather than external locus such as fate or luck. However, people with low self-efficacy are likely to lessen their efforts or quickly settle for solutions when faced with difficulties.

Self-efficacy also affects people's information-seeking process. The way people process, weigh, and integrate sources of information is determined by their beliefs in efficacy. People tend to seek more information and want to obtain further information when they have high self-efficacy in tasks. Researchers also found that provided information has positive impacts on people only if they believe in their capabilities to handle the arousal produced by information. Thus, by ensuring self-efficacy in persuasive messages, one can enhance the positive impact of provided information.

Because self-efficacy is found to be an important factor that affects how people feel, think, and behave, it has been studied in multiple disciplines such as health communication, education, organizational communication focusing on leadership aspects, and government communication for policy makers. For instance, self-efficacy tends to determine people's choices of health-related behaviors such as smoking, drinking, regular physical exercise, and self-examination of illness. Whether people make decisions involving the selection of activities (e.g., quit smoking or stop drinking) is influenced by judgments of self-efficacy. For example, people with low self-efficacy to control their smoking behavior tend to have a lower motivation level because they think they cannot attain the goal. As a result, they are more likely to give up the task than those with high self-efficacy.

EMERGENCY MANAGEMENT

Emergency management is the broad term used to describe the strategic planning and management process by which communities mitigate against, prepare for, respond to, and recover from varying types of emergencies, disasters, and catastrophes. Emergency management is similar to risk and crisis management and communication for an individual organization. However, emergency management also includes the strategic and tactical coordination of police, fire, ambulance, and other community services. Emergency managers must also coordinate efforts with county and state emergency management departments and the Federal Emergency Management Agency (FEMA) depending on the size and scope of the disaster. If an emergency or disaster overwhelms local capabilities, aid is requested from larger agencies with additional resources. The role of public relations in emergency management is typically as the public information officer who promotes community preparedness, delivers official statements, and responds to media inquiries. Smaller county and city emergency management departments are often departments of one, responsible for managing the response efforts and communicating with the public.

The emergency management process includes four interlinked phases: mitigation, preparedness, response, and recovery. *Mitigation* includes the strategies and tactics enacted to prevent or reduce losses in a disaster. *Preparedness* includes the development and testing of emergency plans through continuous exercise and evaluation. *Response* includes the immediate actions taken just before, during, and after an actual event. *Recovery* consists of those activities that continue beyond the emergency period to restore critical community functions.

FEMA has established the Emergency Management Institute to offer comprehensive training for emergency managers who are often current or former police officers or firefighters. The institute now also offers a higher education conference to better incorporate the latest research into emergency management education, training, and practice. In 2007, FEMA's Emergency Management Institute convened a working group of emergency management practitioners and academics to outline core

principles of emergency management. The working group determined that in order for emergency managers to promote safer, less vulnerable communities with the capacity to cope with hazards and disasters, emergency management must be comprehensive, progressive, risk driven, integrated, collaborative, coordinated, flexible, and professional. The International Association of Emergency Managers, a nonprofit educational organization representing more than 5,000 emergency managers worldwide, has since endorsed these principles.

EMPIRE, PUBLIC RELATIONS AND

The relationship between public relations and empire highlights gaps in the understanding of public relations' historical development and its role in global economics. An historical approach can identify important aspects of imperialism that required public relations work, possibly best encapsulated in the German term *öffentlichkeitsarbeit*—broadly “working with publics” or indeed political propaganda or counterinsurgency. Yet, the connection between capitalism and colonialism raises wider questions about the public relations occupation and its ideological assumptions.

Imperialism may be defined as the justificatory hegemonic ideology that supports a centralized expansionist state policy; its corollary, colonialism, may be seen as the implementation of that policy on foreign, but annexed territories. The term *empire* is sometimes employed in Anglophone literature to refer to the former British Empire, although empires were also held by many European powers including France, Belgium, Spain, Portugal, and Germany. Adding to this discussion, scholarly interest has addressed the communicative practices of these empires. This discussion also examined the promotional work done on behalf of such power blocs. These insights add an important, new dimension to our understanding of public relations work and its connections to diplomacy, political communication, and propaganda in the context of those nation-states. In this line of analysis, for instance, Nicholas (2010) has pointed to illustrative examples in Europe and the United Kingdom in particular.

Imperialism and the accompanying expansionism may be seen as part of globalization and may involve military conquest, territorial gains, political agreements, and economic spheres of influence. Since such activities may be resisted, imperialism has been associated with violence as well as exploitation.

From a Marxist perspective and that of some economic anthropologists, imperialism is both political manifestation of and inevitable consequence of capitalism. Competing explanations of 19th-century imperialism highlight the importance of external dynamics and domino effects on the periphery of Europe and political responses to economic problems, according to Peter Burroughs in 2008. Postcolonial and subaltern writers highlight the reinvention of imperial imperatives through public diplomacy and nation-building programs that aim to promote democratic practices and civil society (Dutta, 2009). Two of the pioneers in this discussion, Mohan J. Dutta and Mahuya Pal, wrote that postcolonial theory “primarily engages with the dominant power of the West that imperializes developing nations by advancing the modernist logic of progress and development to justify global capitalism” (2011, p. 197).

The concept of empire necessarily invokes dualisms of center and periphery; colonizer and colonized; colonization and decolonization. It invokes race and color, class and caste, religion, differential

gender relations, and processes of stereotyping and prejudice. Such tensions have been productive in helping us understand the concept of *Othering* and its implications for research practice and for public relations scholarship and understanding of public relations’ international roles and paths of development. That said, there appears to have been little critique of the inherent power relations implicit in such globalizing phrases such as “Think global, act local” or “glocalization” that exemplify an assumed position of dominance.

Over time, there have been many empires and those of ancient times (Egypt, Greece, Rome) receive some coverage in public relations texts, often as examples of public communication or rhetoric. Public relations histories have tended toward the progressive, framing the practice in the spirit of *kaizen*—continuous improvement—both in terms of ethics and effectiveness. In such stories the presence of propaganda is not necessarily a disadvantage but a rhetorical advantage in providing a dark past that may be contrasted with an improving present and bright future.

The dominance of an organizational focus, Edwards (2011) emphasized, has tended to distract from the role of public relations in wider discursive value positioning, such as wealth accumulation as progress and dominance of those from the Northern hemisphere and Western perspectives. Narratives of imperial power, empire, and colonialism were promoted through a range of internal and external communication techniques directed at citizens in colonizing countries as well as those in the colonies, including lectures, print and broadcast media, events and public holidays, and symbolic configurations such as philately.

Public relations literature on global and cross-cultural themes generally focuses on professionalization. While authors acknowledge colonial rule as significant in terms of the history of the occupation, they do not usually provide historical and political context in any depth, explore institutional and governmental relationships, or attend to decolonization processes and its side effects. Likewise, important concepts in any consideration of empire, colonization, and colonialism, such as nationalism, cultural identity, and race, receive little attention.

The politics and business of empire are mixed with a range of communicative strategies and

activities and, in some cases, stimulated advocacy, campaigns in cross-cultural contexts. In short, empire is part of the historical legacy of public relations and further contributes to culturally contextualized understandings of the practice of public relations and its emergence across the globe.

EMPLOYEE COMMUNICATION

Employee communication is the context in which messages are communicated internally to an organization for direct and indirect strategic organizational purposes. It serves within an organizational context as well by the channel, level, and networks used to most effectively and efficiently communicate to or with employees.

Two themes are apparent in employee communication. First, such communication efforts typically manage or improve relationships among employees within an organization, including relationships between employee and supervisor, employee to employee, and supervisor to supervisor. Noting the rich array and use of human messages in organizational settings, Zaremba (2012) pointed out that they are used primarily to manage relationships and are concerned with individual needs of organizational personnel.

These messages can influence organizational climate and culture and are characteristic of activities related to performance evaluation, communication training, and morale building as the relational element of employee communication. Second, employee communication assists personnel to be more effective and efficient in production and service. These types of communication messages focus on company and product and service knowledge and managing the day-to-day work environment. This is intended to help employees be better informed and smarter workers.

Information is presented through task messages. Because of the importance of such messages, Zaremba (2012) observed, particular attention is needed to messages relevant to employee job responsibilities or maintenance messages explaining guidelines, rules, policies, and other procedural information. Although the themes of relational and content messages are not mutually exclusive due to the diverse nature and function of organizations, they do provide a distinction between employee and internal communication. Employee communication is focused on using human messages to manage and build relationships, whereas internal communication is focused on using task and maintenance messages to manage workflow within the organization.

Employee communication can be understood in relation to other organizational communication

functions. Depending upon the size, type, and purpose of an organization, the number of organizational communication functions may vary. They can include image or identity management, advertising, media relations, marketing, financial affairs, community relations, government relations, crisis management, and employee relations.

Although some organizations may have formally established employee or internal communication programs, others may not but still manage a variety of functions that address information sharing, morale building, and product or service understanding, among other activities. All organizations should have some form of employee communication program. In large, high-profile companies such programs constitute an entire department and are formal and highly visible. In smaller companies, employee communication functions tend to be isolated, informal, and managed by a variety of personnel.

Beyond the prescribed communicative functions within organizations, channels or media help define how relationships and information are managed in the context of employee communication. The three most common means used to facilitate the goals and objectives of employee communication are through face-to-face, written, and electronic channels. Face-to-face channels should be used more frequently in activities requiring relationship growth and development. Often employee communication strategies include human resource, personnel, and training functions. Activities and programs related to such topics as employee orientation, compensation, benefits, employee assistance, continuing education, and personal and professional development training necessitate a certain level of face-to-face interaction. In large organizations these functions can be highly specialized and handled by numerous individuals. In smaller organizations, these functions are handled by few individuals with less specialized expertise. In some organizations, management personnel are responsible for most, if not all of the employee communication activities and programs. Commonly, these activities focus on improving relationships and require a great deal of face-to-face interaction and are viewed as relational rather than content functions of employee communication.

Another channel used frequently to facilitate employee communication activities is the written or print channel. This form of print medium varies

greatly by frequency, depth, and focus. Some organizations produce quarterly print materials of issues in great depth, while other organizations produce weekly materials of less substance. Companies like Hallmark Greeting Cards produce a daily form of employee correspondence (*Noon News*) to regularly update company personnel. The nature, purpose, and available resources of an organization in many ways determine the frequency and depth of such publications. Whereas face-to-face channels work well for relational goals of employee communication activities, print channels serve both relational and content goals. Many times written channels are used to announce and coordinate the relational activities of employee communication in face-to-face settings. Print publications also assist employees to develop product or service knowledge or manage quality control and other work content issues within the organization.

Like print publications, the third medium of electronic channels assists in managing messages in both a relational and content manner. In addition to being similar in structure to print channels, electronic channels have become a rapidly growing means of managing employee communication functions. In particular, use of intranets has become an important feature for developing, implementing, and maintaining a strong employee communication program. Intranets provide specific and secure content for employee access.

This type of channel or medium use for all organizational members, especially the employee or internal communication specialist, has had a noticeable impact in three ways. First, the duties and responsibilities of the communication professional have become more electronically and technologically oriented. One who works in employee communication must be proficient in navigating the networked system of an organization. This proficiency entails computer application software knowledge in word processing, database management, desktop publishing, presentational software, the internal email system, social media, and any specialized software programs related to the function and structure of the organization. In larger organizations, the technical functions of employee communication can be quite specialized. In midsize to smaller organizations the electronic and technological competencies may be shared by a number of employees.

The second noticeable impact intranets have had on employee communication activities is that they have improved the accuracy and timeliness of information demanded in the modern workplace. Electronic forms of communication through intranet capabilities have enhanced the communication practitioners' ability to provide accurate and timely information to employees at all levels and to streamline the use of information to improve the efficiency and effectiveness of production or services. Intranets have also improved communication between employees and supervisors. Many intranet systems have been structured to support employee communication functions in human resources and personnel, such as recruitment, selection, and retention of employees. In large organizations, intranets have helped organizations coordinate activities in an accurate and timely manner between such communicative functions as media relations, marketing, and crisis management.

The third noticeable impact in the function of employee communication is that intranets have provided some control in response and interaction time. Intranets have enabled employees and supervisors to communicate in both asynchronous and synchronous ways. Asynchronous communication (communication that is not in real time), as well as synchronous communication (interaction in real time through electronic channels), has created much flexibility for organizational members. The ability to manipulate time and space have influenced the desire and need to interact face-to-face.

The level of interaction is another means to help explain how relationships and information are managed in the context of employee communication. Level of interaction refers to the number of participants in a communication encounter. Employee communication takes place at interpersonal, group and team, organizational, public, and/or mass-mediated levels. Although mediated forms of communication such as email, intranets, teleconferencing, and video conferencing continue to be popular levels of interaction, contemporary employee communication activities require substantial interaction at all levels. Social media or Web-based communication channels such as blogs, wikis, social network sites, and other dialogue-creating media continue to reshape the interpretation of levels of interaction and redefine the boundaries of professional and personal communication practices to

create an every-way flow of communication with enormous message volume and rapid message transmission.

A distinction again can be made between employee and internal communication. Employee communication or messages of relational nature are more frequently managed at interpersonal and group or team levels. Internal communication or messages of a task and maintenance nature are usually present at all levels but are managed at the organizational, public, or mediated levels as well. New forms of social media continue to move employee communication from processes of information control and distribution to strategies and tactics for connection and dialogue.

The final influence to consider when defining employee communication is the networks within an organization. Formal networks are the prescribed, official routes for sending messages, and informal networks carry unofficial messages when sender identity may or may not be known by other organizational members. Employee communication activities assist in moderating, regulating, and modifying organizational networks. Whereas traffic and speed of information is closely managed on the formal network, accuracy is vitally important in managing the informal network. The complexity of formal and informal networks is determined in some ways by the size of the organization. Larger organizations tend to have more complex networks.

Consequently, the functions of employee communication are determined by the complexity of each network. In addition to recognizing the level of network complexity, the communication practitioner must assess the network's ability to improve relationships among employees and to assist individuals in the production or service goals of the organization.

Employee or internal communication is used to strategically communicate to or with employees. It is defined by the functions it manages and is best understood by its relationship to the channels, levels, and networks it serves within specific organizational settings.

ENCROACHMENT IN PUBLIC RELATIONS

Encroachment in public relations practice and research takes place when nonpublic relations professionals come to manage the public relations function. When a marketing personnel gets hired, promoted, or moved laterally to serve as the public relations manager role, he or she encroaches the public relations function. It is an especially serious problem when top management assigns the top public relations position to individuals with little or no training or experience in public relations and corporate communication. Because of what public relations can add to the planning and operations of an organization, its full impact can be lost if the person managing this function does not understand and appreciate what it brings to management-level decisions. Encroachment also compromises practitioners' career opportunities and development.

Three forms of encroachment have been identified: authority, structural, and functional. Authority encroachment has to do with the personnel assignment to manage the public relations department or unit. Structural encroachment subordinates the public relations unit to other units in the organizational hierarchy. Functional encroachment occurs as other departments or units take on activities that expand into the traditional operational realm of public relations or communication management.

Two factors affect the extent to which authority encroachment takes place: (a) other units' involvement in "traditional" public relations functions

and (b) public relations practitioner's ability to serve in a managerial capacity. Units such as marketing, legal, investor relations, and fund raising may have a damaging impact on traditional public relations efforts because they deny some or much of the influence public relations can exert over corporate and communication policy. For example, Martha Lauzen observed that if the marketing department becomes involved in traditional public relations, top management becomes more likely to fill managerial positions of public relations departments with someone other than a senior person in the public relations unit or discipline.

In addition, public relations' authority in the organization is likely to decline when practitioners less frequently serve in a managerial capacity. To reduce encroachment, it is vital that public relations managers take responsibility and be accountable for the success or failure of the organization's public relations program. They need to be respected by others in management so they truly are the organization's public relations expert. They must make communication policy decisions.

Other variables increase authority encroachment, including gender, length of experience, and managerial competence. The increased number of women in public relations raises concern that the profession will be "feminized" and therefore marginalized by managements that "don't take women seriously." Practitioners need to know their discipline as well as the type of organization they serve. If they can't bring such knowledge to bear on increasing the organization's effectiveness, they are likely to suffer encroachment. The ability to resist encroachment increases as they become more experienced in the practice of public relations. They advance the influence of their department if they continue their education and training. Public relations can resist encroachment by being unique and generating its own budget resources, rather than expecting to receive a portion of another department's budget.

Once senior management acknowledges that its organization is challenged by a wide array of stakeholders whose goodwill is needed but is not necessarily forthcoming, then public relations is more likely to resist encroachment. Nothing, unfortunately, does as much good for the role of public relations than for an organization to suffer a major crisis. Once an organization learns that it cannot

take itself for granted, encroachment seems to become less of a challenge; practitioners receive more access to management during turbulent times. Practitioners are given more decision-making power as their value is recognized, sometimes by the test of the fire of crisis.

One of the most important defenses against encroachment is for public relations to be managed by a person who understands the uniqueness of the profession. It loses power and responsibility if it is subordinate to departments such as marketing or corporate legal counsel. Lauzen found that at the managerial level, as public relations and marketing units share domain similarity (the degree to which the two departments share the same goals, skills, or tasks) and as resource dependency between public relations and marketing units increases (the degree to which a member of one functional area must obtain resources from another area to accomplish objectives), marketers tended to become more involved in public relations activities. Further, as marketers became involved more in “managerial” public relations activities (community relations, employee communication, media relations, promotions and publicity, fund raising, public affairs and lobbying, and financial or shareholder relations), more authority encroachment occurred.

Functional encroachment by legal counsel is likely to occur during crisis management. Exploring this hypothesis, Kathy R. Fitzpatrick and Maureen S. Rubin found that the traditional legal strategy was the most prevalent crisis response (simple denial of guilt or acting indignant followed by no comment or saying as little as possible) when general counsel’s influence prevailed during a crisis. Denial and “no comment” tend to be dysfunctional crisis responses. In contrast and supportive of the theme of collaboration rather than encroachment, Jaesub Lee, Stella M. Jares, and Robert L. Heath reported that organizations with an “excellent” culture (i.e., symmetrical communication system, organic structure, participative culture, and strategic planning) lead to collaboration between public relations officers and legal counsels during crisis management.

Kathleen S. Kelly reported that when senior public relations practitioners possess little managerial competency (e.g., environmental scanning or strategic planning), the fund raising department is more likely to structurally encroach into public relations. She argued that even the equal status in

structure (which was often imposed by the organizational headquarters) may lead to the fund raising department’s functional encroachment on public relations because of the imbalance in power, access to the dominant coalition, and resources, particularly during unstable or environmentally turbulent times (e.g., less funding, layoff, recession, and economic downturn).

Academics and practitioners worry that encroachment may affect identity, job satisfaction and turnover, role development, effectiveness, autonomy and control, and other related matters. For example, as non-public relations professionals head public relations units or enact “traditional” domains of public relations, there may be a professional identity crisis or confusion—what is and what is not public relations. Encroachment muddles differences between public relations and other functions.

When encroachment occurs, the public relations practitioner, especially one who aspires to be a manager, may be dissatisfied with the supervisor and may leave the organization. Further, when public relations is managed by an individual from another profession, attention to a variety of strategically important publics tends to be limited, such as those that result in environmental blunders. Encroachment can result in ineffective job performance.

In addition, encroachment threatens the autonomy of the public relations unit and the decision-making authority of public relations practitioners, potentially making public relations practitioners nonmembers of the dominant coalition. It may limit new practitioners’ opportunities to observe, learn, and develop into roles as public relations managers or counselors to the top management. If left unchecked, research findings suggest that encroachment is likely to give public relations less control over its own destiny and career opportunities and dim the chance of survival as a separate entity.

As academics and practitioners have discovered, protecting one discipline against encroachment by another is a vital professional challenge. Practitioners should ask for more responsibility by demonstrating that they add to and defend the value of the organizations which they serve. They must do so because of the uniqueness of their profession, which can be lost if marginalized by another discipline.

ENDORSEMENT

An endorsement is an expression of approval from a third party, usually on behalf of a product, service, cause, or candidate. Endorsements are useful persuasive tools that can appear in publicity, advertising, or other direct forms of communication. They can be either explicit (stated) or implicit (inferred by the audience).

Endorsements can influence a person's knowledge, attitudes, or behaviors in several ways. First, they are often contained in separate communications from other promotional messages. They thus provide an additional opportunity for exposure. Second, endorsements can catch the attention of audiences because they come from entities familiar to audiences, who might otherwise ignore a message

direct from the entity being endorsed if it is unfamiliar. Third, audiences often perceive endorsers to be expert, trustworthy, or independent (with nothing to gain in making a recommendation). Thus endorsements can be more credible than messages disseminated directly by an endorsed entity.

Media Endorsements

Explicit endorsements involve both public approval and a *recommendation* of a product, service, cause, or candidate. Public relations practitioners often seek explicit endorsements from third parties as an important strategy in a program or campaign. Explicit endorsements (1) provide important and often prestigious exposure to reach key opinion leaders and other target audiences and (2) provide the basis for subsequent communications that the endorsement was obtained.

Editorial Page Endorsements

Both candidates and sponsors of initiatives and referenda routinely seek editorial support from influential media. Candidates or advocates conduct *editorial board meetings* to share their positions and to seek editorial support. Endorsements are especially influential and can turn out voters in elections involving local candidates, ballot measures, and nonpartisan races where voters—especially independents—are undecided or otherwise have limited sources of information.

Critics' Endorsements

Reviews by critics play a critical role in programs in the arts, where publicists seek recommendations of performances and exhibitions to create positive “buzz” or word-of-mouth advertising. Positive reviews can stimulate ticket sales, whereas negative reviews can reap ridicule and result in a low turnout. However, popular entertainment such as movies can attract a huge numbers of fans despite being panned by critics.

Editorial Product Endorsements

Reporters and editors routinely recommend products in stories and often create vehicles for making product endorsements that are coveted by organizations. Probably the best-known example

is the Good Housekeeping Seal of Approval accorded to products that meet minimum performance standards (and advertise in the magazine). Other examples include the “*Motor Trend Car of the Year*,” the *U.S. News and World Report* rankings of colleges and universities, Top 10 lists of various sorts, and the numerous “best in town” designations of local businesses accorded by local media. In magazines such as *Consumer Reports*, the product ratings have been shown to correlate with audiences’ perceptions of product quality.

Advertising Endorsements

Product endorsements by famous people have become a popular creative strategy for advertisers. The extensive research about product endorsers suggests that celebrities can attract attention and interest to messages, but their personas and experience must be congruent with the endorsed product or service to be compelling. Cynical consumers discount endorsers who are merely selling their name. Nonprofit and political organizations often enlist celebrities to appear in public service advertising and related messages because they are affected by a problem personally or believe in the cause. Celebrities, government officials, researchers or experts in a particular field, and other notables can endorse causes by signing petitions and statements in paid advertisements, issuing statements or proclamations, appearing at special events, or being interviewed by the press.

Nonmediated Endorsements

Organizations often seek out various other kinds of endorsements to bolster promotion of products, services, or causes. Although these efforts can be used in publicity or advertising, the endorsement serves other purposes as well.

Alliances

Organizations that enter into arrangements to produce or market products or services essentially provide an endorsement of one another. Joint ventures, airline code sharing, franchising, dealerships, authorized software developer designations, affinity marketing programs, and other partnerships have become prevalent because of their cross-promotional opportunities.

Ratings and Designations

Organizations routinely seek out forms of public approval to distinguish themselves from others. Examples include *bond ratings* by research firms such as Moody’s and Finch’s, movie ratings, CD and electronic game *content ratings* from media review boards, *safety ratings* from organizations such as Underwriter’s Laboratories, and *performance* and *satisfaction ratings* of automobiles, computers, and other products by firms such as J. D. Powers & Associates. *Accreditation* is sought by colleges and universities as well as by many professionals who are not required by law to obtain a license to practice. Some products seek approval from professional organizations, such as Crest toothpaste’s “Seal of Approval” from the American Dental Association. In a similar way, producers of foodstuffs adhere to strict standards to be certified as Kosher, and beef producers prominently feature *gradings* such as “USDA Prime.”

Testimonials

Positive comments from satisfied users of products or services or satisfied citizens can serve as powerful endorsements that can appear in ads and editorial features (such as application stories in trade publications) or that can involve presentations, site visits, or one-on-one exchanges between endorsers and others. In a similar way, consultants, advisers, sales representative and agents, professionals in helping professions, community leaders, and other opinion leaders can guide others in evaluating products, services, causes, or candidates. The goal of a public relations program might be to encourage such endorsements by opinion leaders and other influential people.

Philanthropy

Organizations that contribute funds to social causes essentially make statements of support through their actions. That support, in turn, is used by the supported organization to demonstrate to others the breadth and depth of support that exists for its programs. The number and size of contributions and the prestige of the donors are often cited by recipient organizations as indicators of why others should become involved. In a similar way, organizations can express approval of worthy

causes by sponsoring volunteer programs, providing in-kind support, offering facilities, or accepting contributed merchandise for use by the organization. Sponsorship of a philanthropic activity involves a dual endorsement process: Contributors lend credence to charitable or other activities while the recipient organization recognizes and subtly endorses the cosponsor.

ENGAGEMENT (STAKEHOLDERS)

Public relations is founded on the principle that engagement requires an understanding of and dialogue with stakeholders. Stakeholder theory developed in academic studies that examined business ethics as well as incorporating communication and management models. It concerns the relationship between organizations (mostly from a corporate perspective) and those people and groups that could be defined as stakeholders. Naturally, such relationships depend on how well organizations and their stakeholders engage with one another.

In 2007, Xu Wu suggested that much public relations activity is best described as stakeholder relations with key areas of work such as issues management and crisis communication. The importance of stakeholder theory to public relations has been highlighted in 2009 by Stefan Wehmeier whose Delphi study of scholars and practitioners found it to be the second most relevant theory to current practice (after agenda building) and comfortably the most important theory for the future. Terence Flynn in 2006 argued that the role of public relations managers is to act as relationship builders between and advocates for both their organizations and multiple stakeholder groups. However, in 2008, John A. Ledingham reasoned, the attributes of relationships (such as trust, openness, involvement and commitment) differ from concern for the needs of stakeholders.

Peter M. Smudde and Jeffrey L. Courtright, in a 2011 article, contended that stakeholder management has an inherent rhetorical nature, particularly in the way that an organization's stakeholders are

identified and how relationships are maintained and, in circumstances of change, are improved through co-created meaning. Similarly, Kenon A. Brown and Candace L. White in 2010 have noted that managing stakeholder relationships helps avoid the worst effects of a crisis situation.

A major concern of stakeholder theory is identifying who can be defined as stakeholders. Smudde and Courtright noted that the need to engage with stakeholders so as to maintain and improve relationships. These practices are reactive and proactive. Reactive stakeholder management concerns learning lessons from past events whereas proactive requires anticipating and influencing future activities, environments, and relationships.

In addition to the different theories of stakeholding and definitions of stakeholders, scholars and practitioners have investigated technological developments that portend fundamental changes to the way that organizations interact with their stakeholders. Terence Flynn advised a move away from thinking of organizations and their publics as simplistically involved in a two-way process to seek an equilibrium that satisfies the mutual interest of all parties.

The conduct of those relationships is based on communication and, as Rian van der Merwe, Leyland F. Pitt, and Russell Abratt (2005) stated, technology has changed stakeholder communication behavior. Stakeholders communicate with each other publicly, thereby becoming more vocal and influential in their interactions with organizations.

To understand how organizations engage, recent studies have examined the type of online communication in which they engage. In 2010, Sora Kim, Jae-Hee Park, and Emma K. Wertz sought to identify and categorize Web-based messages that top corporations (Fortune 500 companies) use to engage with stakeholders. Of these groups, shareholder needs were found to be addressed most often and activist needs least often. Such a gap could be a signpost to a potential threat to an organization's reputation.

Another study of top corporations in 2010 by Svetlana Rybalko and Trent Seltzer has categorized ways of engaging with stakeholders on Twitter into dialogic and nondialogic. The authors found that along with other websites, weblogs, and social networking sites, Twitter is being underutilized by organizations to facilitate dialogic communication

with stakeholders. Relationships are not determined by technology, but by how it is used.

Van der Merwe and colleagues suggested four ways that organizations can respond to the Internet-generated stakeholder based on whether their approach is proactive or reactive and the minor or major extent of the approach. The four ways are as follows:

1. *Redundancy (minor/proactive)*—ensuring there is no need for stakeholders to embark on Internet initiatives that may threaten the organization by attempting to balance all interests
2. *Resourceful (major/proactive)*—creating a Web presence that may be harmful if someone else does it, such as complaints sections where people can air grievances
3. *Reformative (minor/reactive)*—remediating problems as they arise
4. *Removal (major/reactive)*—embracing a website or getting rid of it through legal action

Stakeholder theory has the potential to help the profession clarify the purpose of relationships with different groups especially based on roles and interests. Stakeholder theory attempts to categorize stakeholders in order to develop strategies that are appropriate to those particular interests. These frameworks relate to the capacity of some groups to exert influence based on the interest, or stake, they have in an organization. The strategies may vary according to the type of information that is exchanged and how well stakeholders are able to interact with the institutions in question.

ENLIGHTENMENT AND MODERNITY

In northern and central Europe, public relations is rooted in the concepts of enlightenment and modernity. In German-speaking countries, it is still called *Öffentlichkeitsarbeit*, which is literally translated as “working in [the] public sphere” and can be defined as “working for the public, with the public, and in public.” In many other European countries, public relations is also referred to as an organization’s obligation to “relate to [the] public sphere.” *Öffentlichkeit* is seen as an outcome and therefore, a quality of public communication in society; it means “which people talk how about

what.” Although some normative elements can be found in these sociological approaches, this view differs from the community-building approach developed by Dean Kruckeberg and Kenneth Starck in 1988, who defined public relations in a normative way, as the social conscience of an organization that contributes to mutual understanding among groups and institutions and brings harmony to private and public policies. This definition reflects a premodern approach to public relations.

In many European public relations approaches, the concept of *legitimation* is used to describe how an organization, as the exponent of one of the institutions in the social system, coproduces public policies and thereby the empirical realization of institutions. An organization is legitimate as long as there is no public discourse concerning its legitimation. Although the social sciences have been used to define the concept, legitimacy is neither a moral nor an ethical principle but, rather, is related to the empirical issue of what is good and justifiable for the members of society. “The legitimacy of an organization is a measure of the extent to which the public and the public sphere at a given time and place find the organization sensible and morally justifiable” (Munck Nielsen, 2001, p. 19). It is therefore a fundamental empirical and not a normative approach and is rooted in a modernist approach to society.

Franz Ronneberger and Manfred Rühl stated in 1992 that, in managing the communications of an organization, management cannot avoid having an empirical function in the development of society. Ronneberger claimed earlier that clarifying the different perspectives in public discourse, thereby furthering the development of public opinion, is the most important role of public relations. Werner Faulstich sees public relations as interaction in society itself: It makes something publicly known and creates public discourse. Thus, we may argue that communication management is part of the “social structure of public meanings” because of its social construction of community. In this way communication management is defined as part of the larger societal communication system, much like journalism and advertising. Most of the German and Danish public relations researchers, such as Hans-Jürgen Arlt, use such a social science paradigm, which can be seen as an outcome of modernist thinking.

At the end of the 18th century, reasoning was seen as a fundamental human activity for the first time. Descartes said, “*Cogito, ergo sum*” (I think, thus I exist) and emphasized individual power to create a rational world. The same idea was expressed by philosophers like Immanuel Kant, who explained that in a modern world people should no longer act as national subjects of the powerful but as citizens who are able to rule the world themselves by citizenship and rational thinking and acting. Traditional authority, according to George Ritzer in 2000, became unacceptable and “irrational, that is, contrary to human nature and inhibitive of human growth and development” (p. 12).

Modernity contrasts with the premodern, traditional idea of an ideal social structure. Modernity was developed by great 19th-century sociologists such as Auguste Comte and Henri De Saint-Simon, who maintained that human evolution should be seen as an irrefutable development toward improvement and that this improvement began in their time. The concept of modernity can explain the period of the Enlightenment. Well-known contemporary scholars devoted to modernity are Jürgen Habermas and Anthony Giddens. At the end of the 20th century, they in turn were highly criticized by postmodern scholars such as Jean Baudrillard and Michel Foucault.

Sociologist George Ritzer characterizes the Enlightenment by the belief that people could comprehend and control the universe by means of reason and empirical research. The view was that because the physical world was dominated by natural laws, it was likely that the social world was, too. Thus it was up to the philosopher, using reason and research, to discover these social laws. Once they understood how the social world worked, the Enlightenment thinkers had a practical goal—the creation of a more rational world, as Ritzer explained. In the Netherlands, the word *voorlichting* was until recently used as an equivalent for public relations. In the 18th century, science and knowledge were no longer seen as the possessions of the elite only but as things that had to be diffused among all members of society. The means for this diffusion was *voorlichting*, which can be translated as “enlightening.” The idea of *voorlichting* is based on *sapere aude*, an expression of Immanuel Kant that literally means “dare to know” and that ultimately meant that “all people

must be willing to be informed on what is going on and made enlightened, so that they can take part in the ongoing debate about and development of society.” Besides education, voorlichting was seen as the main way to help people be informed and so came to be defined as “giving full information to all people to mature and emancipate.”

Many people who were afraid of this enlightening of ordinary people expressed a more traditional view of society. They preferred to use voorlichting to show people how to behave as good citizens and to control them. The history of voorlichting can therefore be seen as a history of the battle between information and emancipation on the one hand, and education and persuasion on the other, but always under the (“Dutch uncle”) dogma of “knowing what is good.” In all theories of voorlichting the rather pedantic premise is that it is given for the benefit of the person or group to be enlightened, even when the persons involved do not want to be enlightened at all or at least not in this way.

In the period of the Enlightenment, the idea was that human beings create society, and that society in turn creates its institutions, and thereby the reality for human beings, in a dynamic process. This is the basis for a constructionist view of public relations.

ENTERTAINMENT INDUSTRY PUBLICITY/PROMOTION

Public relations practitioners who work in entertainment-related industries and fields often specialize in publicity and promotion. Publicity is media coverage generated in newspapers, in magazines, on radio, on the Internet, and on television. In most cases, coverage is intentionally placed by an individual rather than a news reporter covering an assigned story for publication. Publicity can be sought by any individual, but those who specialize in it are called publicists. Many public relations practitioners, even though not labeled publicists, frequently are involved in some activities that generate publicity. Some even specialize in media relations, a subset of public relations, which involves forming on-going positive relationships with media gatekeepers.

The entertainment industry encompasses a wide variety of organizations, including performing arts centers, museums, orchestras, opera companies,

Broadway theatres, aquariums, amusement parks, record companies, motion picture corporations, television networks, sports operations, and major artists who have become corporations in themselves. All of these organizations need specialists who publicize and promote their activities. The objective for most specialists is to sell something—CDs, movie tickets, tickets to a show or concert, or even an image.

The publicity and promotion activities in entertainment-related industries are typically part of the marketing mix: product, place, price, and promotion. Unlike the term *publicity*, *promotion* is an umbrella word that encompasses advertising, public relations, sales, and sales promotion. Practitioners who work in entertainment may also handle advertising. In a performing arts center, for instance, practitioners create advertisements that run in local newspapers. They produce brochures and other publications for patrons and series subscribers. They work with a sales force to develop sales materials for telemarketers who specialize in group sales or series renewals. Sales promotion techniques give the target audience an incentive to buy the product. For example, in the performing arts, the practitioner may coordinate an artists' reception for theatergoers or hold a special drawing for tickets on Facebook. In almost all aspects of entertainment promotion, the use of social and digital media has become commonplace.

Publicity plays a large part in entertainment. An entire field of journalists reports on the expansive world of entertainment to satisfy their public's interest. Publicists in the entertainment field focus their time on gaining coverage for their clients or organization. They prepare press materials and pitch stories to media gatekeepers. They work with feature editors of metropolitan newspapers, associate editors of magazines, assignment editors of television news shows, producers of television programs, news directors and program directors of radio stations, bloggers, and a myriad of other journalists. A skilled publicist studies the work produced by a particular journalist and the editorial environment of the publication or show in an attempt to develop an interesting angle tailored for that particular media outlet.

A nonprofit organization, the Entertainment Publicists Professional Society (EPPS), was formed in 1991 and provides a forum for members to

share their expertise and exchange information. With chapters in Los Angeles and New York, the society describes itself as "the premiere organization for entertainment publicity and marketing professionals." Some of its objectives are noted on its website:

To serve as a professional resource for the entertainment industry and academic institutions in matters involving entertainment public relations

To provide members with regular and special programs that explore current issues, the latest advancements and future directions of the profession

To encourage the highest professional standards

The EPPS conducts educational programs for working publicists and offers monthly panels with national talk show bookers, morning show producers, and other noteworthy media gatekeepers.

Four models are widely accepted to describe the evolution of public relations: press agency/publicity, public information, two-way asymmetric, and two-way symmetric. Many public relations professionals in entertainment practice the press agency/publicity model, which focuses on persuading and influencing opinion, but an expert in entertainment publicity and promotion also relies heavily on research and strategy.

Press agency is closely associated with publicity in the entertainment world. Press agency is the practice of attracting the attention of the press through techniques that manufacture news. Methods associated with press agency include staged events, publicity stunts, faux rallies or gatherings, spinning, and hype. A common practice in the late 1800s and early 1900s, press agency is not part of mainstream public relations. Rather, it is a practice primarily associated with major entertainment-related events such as Hollywood premieres and boxing matches. The goal of press agency is to attract attention rather than gain understanding. Even today, however, the term *press agent* is sometimes used interchangeably with *publicist* in traditional Broadway theatre and motion picture industries. Today's entertainment industries are populated with publicists rather than press agents. Publicists are individuals skilled in media relations and attempt to get the name of their clients or

events in the media by carefully constructing messages that inform, educate, and persuade. Some are astute in branding and positioning strategies to aid the careers and success of their clients.

ENVIRONMENTAL GROUPS

Environmental groups can either be a major source of work and irritation for public relations or a very helpful supporter. Almost all organizations today must address environmental issues at some point. Beginning in the late 1960s and extending to the present, Congress has enacted and reauthorized laws that affect all aspects of business, from raw materials used to production processes and by-products. Current practices are not the only ones impacted. Many organizations are being forced to deal with the environmental impacts of activities that took place decades ago. And for every environmental issue with which an organization must deal, there seems to be at least one environmental group ready to scrutinize its words and deeds.

In terms of the national or international environmental groups, some deal with broad environmental concerns, and some are fairly focused on a single issue. Many of these groups have clear and even stated political agendas. While a large, parent group will focus on issues with broad impact, local chapters of a group take up specific issues of local

concern as well as support the larger group. Some environmental groups are not connected with a national organization and are composed entirely of local citizens who have banded together to address community concerns. Thus, in environmental matters, public relations must be prepared to deal with a broad range of interests and agendas. Some general categories of groups based on their approaches to issues are discussed in the following sections.

Radical

This category includes groups such as Earth First! and Greenpeace. Although they cover a broad range of environmental issues, they are grouped together because of their very visible and often contentious approach to issues. These groups have taken a lesson from Edward Bernays's approach by using staged events (probably more sensational than Bernays would have approved of) to generate media coverage, a major goal of such groups. They want the widest possible dissemination of their position and message, and they are willing to go to great lengths to achieve that goal. Some examples include Earth First! members chaining themselves to trees or engaging in tree sits (camping out in a tree for weeks on end), Greenpeace members repelling on Mt. Rushmore on July 8, 2009, to unfurl a banner calling for leadership in the fight against global warming, or Greenpeace members driving dinghies around oil tankers to protest shipping too close to sensitive shores (directed not only at the oil companies but at the government as well). Although they sometimes accomplish the goals of saving trees or coastal ecosystems, these actions are designed to reach a mass audience through media coverage. The events have visual appeal and are unusual, two attributes public relations often strives for when trying to place a story. Sometimes it even appears that these groups understand media relations better than the public relations staffs charged with addressing the negative press these groups generate for the target organizations. To reach the online world, Greenpeace makes good use of Facebook, Flickr, Twitter, YouTube, Google Plus, and Pinterest, extending indefinitely and very broadly the documentation of their actions.

Animal rights activist groups, such as the Animal Liberation Front (ALF), are sometimes considered

radical. ALF has been known to go as far as violating laws by breaking into labs or fur farms to free animals. They are quite unrelenting in their approach to their cause, advocating vegan diets and complete elimination of all animal products.

When faced with groups such as these, public relations practitioners are in a very difficult situation. These groups do not like to compromise and seem to thrive on direct confrontation. Confrontation is what they are trained for, and they know how to use it to gain even more media attention. Some organizations do try to confront these groups, with mixed to disastrous results. Others try to ignore them and hope they'll go away or the media will find a new story to cover. There is no one answer for how to deal with these groups. Each situation and the temperament of the targeted organization will to a large degree determine what public relations can and can't do. The only certain approach is to try not to do anything that will inflame the situation any further.

Mainstream Activist

Groups such as the Sierra Club and the National Wildlife Federation have broad memberships across the United States. They are more centrist than the radical groups, although they, too, have well-defined political agendas. They approach these agendas through professional lobbyists and grassroots organizing. While they certainly can, and have, approached businesses and governments in a radical manner, their typical approach is through media and political pressure and influence. Basically, these organizations are structured and behave very much the way many businesses do, with elected presidents and boards, national offices, and strategic planning for both accomplishing their environmental agenda and maintaining and increasing their membership. For example, the Sierra Club offers environmentally sound investment packages for its members. (It should be noted that many radical groups also follow such organization, but their approach to issues gives them a very different outward appearance.)

One key to understanding such groups is to understand their membership. Organizations such as the Sierra Club and the National Audubon Society (not just concerned with birds but also with habitat conservation and a range of environmental

issues) have state and many local chapters and even publish magazines. Although their members do join to support an environmental cause, the groups use social functions to maintain support and cohesion. The Sierra Club offers national vacation opportunities centered on environmental themes, and local chapters have outings and activities, not all of which are environmentally related. Local Audubon chapters go bird watching, hold annual bird counts, and have meetings with noted speakers. The end result is that people identify with the organization and thus write letters and often vote in accord with the organization's positions. National endorsements can be important, but a strong showing on local issues can have an even greater and more direct impact on organizations, because changes in the local operating environment can sometimes be more critical to organizations than national issues. The organizations also take full advantage of social media and email. Members of the Sierra Club receive a weekly (frequently more often) email message to sign a petition or send a message to government officials about various issues. The messages come already written but allow for personalization, contain contact information specified by the member, and go directly to the appropriate official (president, Environmental Protection Agency administrator, senators, U.S. representative, governor, etc.). As much as social media and the Web have been useful to corporations, they have been a major boon to non-profit organizations and advocacy groups.

Unlike with radical groups, there are realistic possibilities for interacting constructively with mainstream activist groups. These groups must balance the pursuit of their environmental goals with the need to maintain approaches consistent with the perspectives of their members. Certainly there are points beyond which these groups will not bend, but often there is both room and willingness to negotiate on issues. For example, if organization X is willing to preserve the most sensitive natural areas on its complex as wildlife areas, it may be able to work a compromise with the environmental group criticizing it about plans for plant expansion and even get the group to endorse the revised plans. The key to success here, as in any negotiation, is to understand the values and constraints of the other side and create a match with the organization's desires. When such

a compromise can be reached, the organization should realize good opportunities for positive press about its environmental efforts.

Quiet Workers

Another type of environmental group consists of those who maintain a relatively low profile while working to achieve their goals. These groups rarely, if ever, assume the attack posture of a radical group, but they do occasionally use political and media pressure to push their point. More often than not, these groups look for appropriate partners to help them achieve their objectives. For example, the Nature Conservancy partners with government bodies and businesses to preserve important natural places; its website lists its partners and describes the work they are doing together. The conservancy uses established science to determine which areas are essential for protecting important ecosystems and then does everything it can to protect those lands. The conservancy uses everything from conservation easements to gifts of land or land purchases in its attempt to ensure stable ecosystems for the future.

The Ocean Futures Society, headed by Jean-Michel Cousteau, takes a slightly different approach. Ocean Futures, as the organization and Cousteau names indicate, is concerned with protecting the world's oceans. Membership in the society is free. It has a well-established education function that originally focused mainly on children but now has broader appeals. The society provides information and experiences that it hopes will impress upon participants the importance of healthy oceans and the general environment to the health of humankind. The underlying goal is to create a broad public base that values the oceans. These efforts are made possible through many partnerships, some of which seem natural (Body Glove, Catalina Island Camp, and Force Fin) and at least one of which seems unusual (Dow Chemical, proving that a historical environmental "villain" can work constructively with some environmental groups; Dow also partners with the Nature Conservancy). All partners are listed on the Ocean Futures website and include links to their corporate websites.

Clearly, environmental groups such as these provide opportunities for constructive partnerships, enabling organizations to generate positive

environmental coverage for themselves. Finding an appropriate partner (there are no oil companies listed as Ocean Futures partners) is the key, and a task public relations practitioners are well suited for.

Local Community Groups

These groups form around issues of specific concern in a community. Although some members may belong to larger environmental groups and call on them for support, the focus is on the conditions in the immediate area. Examples of these types of groups include Lois Gibbs and other Love Canal (New York State) residents, inner-city groups who form to fight industrial pollution and landfills in their neighborhoods (these are often minority groups and fall under the environmental justice movement), and the many citizen groups that came together to fight environmental problems at U.S. nuclear weapons production facilities.

Members of these groups may start out without much knowledge or information, but they tend to acquire it quickly. Personal safety and the safety of one's family are key motivators to action. These groups may also lack power, particularly when compared to the organizations they often oppose. But that should not be a reason to overlook them. Lisa Crawford and the residents around the Fernald (Ohio) nuclear weapons plant got their problems on the cover of *Time* magazine and successfully sued the U.S. Department of Energy, winning compensation for lost property value, health problems, and lifetime medical monitoring. They educated themselves about air and water pollution, the effects of radiation, and remediation technologies. They made everything that happened at the plant their business. When the media had a question about something happening at the plant, they would go to Crawford for a quote. And this group connected with groups at other weapons facilities to exchange information and tactics for dealing with their problems. The pressure exerted by these community groups, individually and as a whole, played a major role in forcing the government to clean up the weapons facilities. By the time they reached the actual cleanup phase, the cleanup organization at Fernald consulted with the local citizens on most cleanup decisions, major and otherwise, rather than simply tell them what the decision was on a course of action.

The power of local community groups should never be underestimated. The media love an underdog, and there are few more appealing than a group of mothers fighting for the health of their children. Emotional appeals are very common with these groups, especially in the early stages of a conflict. An organization can rarely win such a battle, and more often than not looks extremely callous when trying to do so. The proliferation of social media enables community members to spread their views more easily and effectively than ever before. The group's concerns must be taken seriously and addressed in a meaningful manner. At this point, an organization often becomes involved in risk communication. Dealing with these groups successfully, and with all other environmental groups, requires that an organization be able to support its claims with specific actions taken to address environmental concerns.

Overall, an issues management approach should be used to address environmental groups and their concerns. The ultimate goal is to be prepared through research and informed anticipation. Organizations can influence environmental regulations and anticipate objections to their actions that groups will have. Public relations can accomplish this task through monitoring national and international groups on the Web and social media in order to track environmental concerns and also find appropriate partners for positive environmental activities.

ENVIRONMENTAL SCANNING

Environmental scanning is an ongoing method of gathering information from the environment for use by an organization in strategic decision making and issues management. It is an early warning system for changes, issues, and reputation of the organization—a type of radar to monitor trends in order to help top management plan for the future. In addition to detecting emerging issues and helping avert crises, the strategic intelligence provided by environmental scanning can also help quantify existing problems.

Although environmental scanning or monitoring appears to have originated in the business management arena, David Dozier referred to it in the context of public relations as “the gathering of information about publics, about reactions of publics toward the organization, and about public opinion toward issues important to the organization” (1986, p. 1).

In addition to detecting threats and opportunities for the organization, environmental scanning also encourages future-oriented thinking in the organization's decision makers.

As a research method designed to bring information into the organization, environmental scanning is a function of an open system, which uses either two-way asymmetric or two-way symmetric models of communication.

Relevance of Environmental Scanning to Public Relations Professionals

Environmental scanning is important in public relations because successful management of dynamic organizations depends on the ability of the senior leaders to adapt to a rapidly changing external environment. Because management can become insulated from key publics, the public relations practitioner uses environmental scanning

data to help keep the dominant coalition in touch with the opinions of those critical to the organization's success or failure.

Collecting and processing intelligence about the environment also makes the communication manager a useful and necessary part of the organization's management decision-making team. Those who don't do environmental scanning are often not included in the dominant coalition. Dozier and Larissa A. Grunig (1992) wrote, "This is one source of power that practitioners can use to redefine the public relations function and alter its vertical and horizontal structure" (p. 412).

The news cycle is now 24/7. Global audiences are empowered to share their opinions with and about the organization. As a result, organization leaders and communication professionals face information overload with the availability of more data than they can efficiently and effectively process. Having a formal environmental scanning program can help identify the sources of information most important to the organization. A scanning program, therefore, is a way of separating the wheat from the chaff.

Conducting Environmental Scanning

There are few guidelines on how to do environmental scanning. Scanners should have a deep understanding of the industry in which they operate and know the players in that arena as well. Scanners should watch for signs of change, look for signals of potential events on the horizon, study forecasts of experts, and write abstracts to crystallize thoughts. Interviews with key decision makers in the organization and a review of the current strategic plan may help develop an initial list of trends and issues to monitor.

To develop the objectives of the scanning program, the public relations practitioner must decide the level of resources to devote to scanning. A shift in power between organizations and publics who can now produce, consume, and instantly share content about the organization has increased the need for environmental scanning. Doug Newsom, Judy VanSlyke Turk and Dean Kruckeberg (2013, p. 63) called this shift a move to "more actual two-way symmetrical communication."

To meet the objectives of the scanning program, scanners must identify the specific media or

environment levels to monitor. In the legacy media era of the second half of the 20th century, scanning levels had relatively clear distinctions between the local environment, the industry environment, and the global environment. While high-speed, digital access to global audiences softens the boundaries between levels of scanning, analysis of a wide range of areas including stakeholders' opinions remains essential. According to the American Marketing Association (2012), "environmental forces considered are the political, cultural, social, demographic, economic, legal, international, and ecological factors."

Both informal and formal methods can be used to gather information. Samples used in casual research may not be scientifically representative but may still be beneficial as is listening in social media interactions. Practitioners also scan by studying traditional mass media, social media, blogs, and specialized media specific to their organization's industry. They may confer with a network of contacts like colleagues and experts within their industry, advisory boards, online forums, or political and community leaders. Input from phone calls, letters, emails, website comments, Twitter feeds, and other communication channels may be useful as well. More formal methods of gathering market research data through surveys and focus groups may be used, along with ongoing communication programs with the organization's priority stakeholders.

After information is gathered through the scanning process, it must be analyzed and interpreted for the dominant coalition. The public relations professional should help interpret and incorporate it into strategic decision making.

ETHICS OF PUBLIC RELATIONS

Public relations has been roundly criticized as a field and professional practice with ethics that are based on manipulation and “spin.” Public relations ethics should be discussed, researched, and refined because of the weighty responsibilities of the function within an organization and its ability to wield influence in public policy as argued by Robert L. Heath, Shannon A. Bowen, Maureen Taylor, and others.

Scholars define *ethics* as the study of what is right and wrong, fair and unfair, in how we should make decisions. Ethics assumes that truth and morality exist and can be discovered through the rules, values, and principles that govern—or should govern—behavior.

Organizational Conscience: Power and Responsibility

Attitude and behavioral changes resulting from the power inherent in public relations are demonstrable. Public relations has the power to define issues, thereby shaping public opinion by deciding what information is important and thereby altering perception of an issue. Public relations pursuits such as public affairs and lobbying,

political communication, corporate communication, and activist communication all shape the societies in which we live. Add to this list the ability to shift financial markets and alter supply and demand, and it becomes clear that public relations is powerful. The power to influence society means that public relations holds a responsibility to the public interest and society itself to be ethical. That responsibility is argued to far outweigh concerns of self-interest or advocacy on behalf of a client.

Organizational Role: Public Relations as Ethics Counsel

Systems theory explains that the public relations practitioner is a boundary spanner, holding roles both inside the organization and in publics outside the organization. To understand the publics outside an organization, the public relations practitioner must maintain effective and open communication with them, sometimes joining their groups to understand their viewpoints. He or she acts as a representative of the organization’s position while meeting with publics, and while meeting with management acts as a representative of publics’ opinions.

The relationships that the public relations practitioner maintains with publics outside the organization are unique because they provide valuable information to top management on how those publics view certain topics, the values each public holds, and how that public is likely to react to a given decision. This input can become a crucial part of strategic decision making. It can also help to identify issues and solve them proactively before they become major problems. In general, this boundary-spanning role puts pressure on public relations practitioners to be ethical. In performing the public relations functional ethically, a positive social role is created in which public relations facilitates the information needed in society and helps facilitate civil society.

Spin and Credibility

The credibility of the public relations field has been called into question by numerous critics. Research analyzing how the term *public relations* was used found consistent use of the term *public*

relations to suggest manipulation of the truth to a dubious end. In 2003 and 2009, Shannon A. Bowen found that even university students majoring in public relations held negative misperceptions of the discipline and misunderstood its basic responsibilities early in their course of study.

In actuality, ethics is an important consideration to both practitioners of public relations and scholars who teach and study it. The major industry associations of public relations all have codes of ethics and offer ethics seminars and training for practitioners. The discipline contains scholars who research and refine the ethics of public relations as their life's work. Ethics is a part of the public relations curriculum in classrooms around the globe and was recommended to be the top priority of study for graduate students in public relations by the Commission on Public Relations Education in 2012.

The dubious historical beginning of public relations, confusion of public relations with propaganda, and a contentious relationship with journalists have all contributed to the reputation of public relations as an unethical or manipulative pursuit. Although this misconception is prevalent, honest communication and discovery of the truth are utmost concerns in the public relations discipline and professional practice. Even early practitioners such as John W. Hill argued for rigorous ethical standards; he believed that public relations should be the ethical conscience in an organization.

Of course, cases of ethical violations exist within public relations. These cases become infamous examples to which critics often refer in attempting to discredit the field. What those outside the discipline often fail to understand is that public relations is in the business of solving potential issues before they become problems or crisis situations that would be worthy of media notice. This proactive problem solving is the issues management function of the field. Success in public relations often means resolving an issue before anyone complains about it, thus saving the business untold sums of money it might have spent on lawsuits, media relations, lobbying, compliance, strikes, and so on. Success in issues management is often measured in terms of ethical decisions, averted crises, and money saved by an organization. Thus, the victories of public relations are often unsung.

Approaches to Public Relations Philosophy and Ethics

Scholars have attempted to conceptualize a body of knowledge on ethics of public relations. Public relations scholars have applied moral philosophy to public relations ethics and found it a fruitful area of study. However, few public relations practitioners have studied moral philosophy or ethics; and most tend to rely on situational ethics, personal experience, or self-interested risk versus reward analyses of dilemmas rather than rigorous philosophical analyses. A situational approach to ethics is problematic because it sees no universal or generally applicable moral norms but looks at each situation independently. The lack of guidance given by situational ethics limits its usefulness; furthermore, it is normally employed by those with very little ethics training. Scholars found that public relations courses and texts give little attention to the topic of ethics.

Most appropriate for the study of public relations ethics are the philosophical schools of utilitarianism or consequentialist theory and deontology or nonconsequentialist theory. Consequentialism bases the choice of what is ethical on the projected consequences of the decision. Consequentialism asks us to predict the possible outcomes of our decisions and perform a cost-benefit calculation among the potential outcomes. The ethical outcome is that which generally has the most positive consequences and the least negative consequences. Utilitarianism is the most popular type of consequentialist ethics, defining as ethical that which produces the greatest good for the greatest number of people.

Nonconsequentialist ethics uses a different measure of what makes an act morally worthy. Worthiness is defined as doing one's duty to uphold moral principles that apply equally to all people. In this school of thought, ethical behavior is based on what is morally right in principle, rather than on the projected outcomes of a decision. The consequences of a decision are not ignored, but they are not the decision-making guide used in contemplating the correct option among alternatives. Deontology is the most prominent type of nonconsequentialist ethics.

Doing one's duty to follow moral principles objectively is how deontologists define ethical

behavior. For example, the maxim “It is wrong to lie” would be a universal moral principle, because a lie only works under an assumption of truth. Society would lose this assumption of truth if all people lied whenever it suited their own, subjective interests. Therefore, we can generalize that lying is morally wrong because it is not consistent with our duty as rational agents to uphold moral principles and it becomes logically contradictory when applied. This type of reasoning has proven to be beneficial to the practitioners and organizations who employ a deontological paradigm. Deontological ethics increases with the age and moral development of public relations practitioners.

Public Relations as the Organizational Conscience

Many public relations studies over the years supported the idea that public relations practitioners should act as the ethical conscience of their organization. They are seen as naturally filling this organizational role because of their expertise in relationship building, conflict management, reputation management, and communication with publics. However, they must study ethics in public relations to effectively fill this role.

Applying these ethical models to public relations practice and educating public relations practitioners about the approaches to analyzing a moral dilemma are primary concerns in this field. For public relations to mature, grow in responsibility, and perform the role of ethical counsel or ethical conscience of the organization, practitioners must be well versed in ethics and trained in ethical analysis. Forward-thinking organizations are embracing this idea today. The growth of public relations ethics will ensure that it can overcome a dubious beginning and perform a positive function in society by providing information and by building and maintaining relationships between organizations and the many publics that they serve.

ETHNOGRAPHY OF PUBLIC RELATIONS

Ethnography is concerned with making sense of human action, however complex, contradictory or taken-for-granted, by exploring the sociocultural context within which those actions take place. As a research approach, ethnography can offer more nuanced understandings of the social significance of contemporary practice and the interrelationship between public relations and broader economic, political, and cultural processes. Grounded in interpretivism, ethnography uses culture as a lens through which to study public relations—whether societal, organizational, or occupational.

Culture can be understood as the historically transmitted patterns of beliefs, values, and symbols that are relevant to a social group and that shape members' understanding of, and behaviors within, a particular environment. The cultural meanings uncovered will be grounded in subjective, socially constructed contexts, which are informed by the social world in which individuals find themselves. Ethnographic accounts provide detailed "thick" or "emic" description, or "insider accounts." The aim is not to seek precise analyses of the practice but to produce historically sensitive generative resources that add to the varying accounts of public relations emerging from different professional and sociocultural contexts around the world.

Ethnography seeks to explore what people do and why they do it, as well as their expectations and aspirations for the future. It offers voice to those being studied. Several sources of data are used including the following: participant observation, direct observation, interviews and conversations, diaries and life histories, photography, audio or video recordings, document analysis, and artistic genres such as poetry and storytelling. When engaging with ethnography, it is imperative that researchers display a commitment to entering the social world they are studying, both physically and emotionally, and locate themselves within their research as cultural interpreter in order to make sense of the environment and reflect upon their role in gathering and interpreting the data. The principal method used, therefore, is extended

participant observation, which encourages what Harry Wolcott refers to as intimate, long-term acquaintance.

Opportunities for ethnographies of public relations are diverse. A researcher undertaking a corporate ethnography of the London headquarters of an international agency, for example, might seek to become part of that organization as either a paid or voluntary member of the team in order to interpret the nature of professional relationships within the organization—such as those between the account director and junior account executives. Observational work would include a symbolic analysis of the use of material artifacts within the department and the ways in which work and social spaces are arranged within the office to reinforce the particular managerial positions within it as well as how the team operates within the broader cultural context of the organization. Ethnographic techniques can also be used to explore the ways in which internal and external stakeholders make sense of a corporate brand, as well as the production and communication of public relations messages, or to develop a holistic interpretation of a particular public's attitudes, behaviors, and experiences. Ethnographic data could then be used by organizations to improve their communication strategies and ensure that they develop messages and utilize communication channels that resonate with the cultural values, expectations, and communicative behaviors of their target audiences.

In addition to classic ethnographic methods, public relations scholars are engaging with more diverse approaches, including autoethnography and netnography. In contrast to traditional ethnography, which has been largely concerned with studies of cultures in unfamiliar contexts, autoethnography is concerned with the exploration of the relationships between self (auto), public relations practice (ethnos), and the writing and research process (graphy) with the aim of translating a "familiar" culture to an audience of cultural "outsiders." One example might be a study that considers the professional tensions between academic, practitioner, and personal identities when carrying out pro bono work for a local activist group. Netnography (or virtual ethnography), on the other hand, is concerned with observing a website or websites and related discussion forums over a period of time and analyzing user-generated content

and the messages members post to one another. With an increasing shift in power away from practitioners and into the hands of publics who are able to share their stories and to generate their own forms of promotional content online, understanding how their activities shape the virtual environment and, importantly, how what is being spoken about online impacts upon their success is vital to organizations.

There are obvious ethical challenges associated with any form of ethnographic research such as consent, disclosure, power, and representation. Ethnographers of public relations will follow the ethics codes associated with the academic discipline and those of the relevant professional associations and any institutions collaborating in the research. It will also be important to take into account ethical issues raised by the specific socio-cultural environment under study and the personal beliefs and ethics of research participants.

Scholars are becoming more open to broader cultural approaches to the study of public relations. Ethnography offers public relations scholarship and practice the opportunity to consider broader visions and forms of practice and diversity in experience.

EUROPE, PRACTICE OF PUBLIC RELATIONS IN

Although rarely named as such, public relations in Europe is thriving, with a multidimensional European identity. In 2012, Europe consisted of 51 countries. Europe had no pancontinental individual membership public relations association for practitioners until 2006, when the European Association of Communication Directors (EACD) was established by members from 23 different countries. European academics and teachers have their own regional association: European Public Relations Education and Research Associations (EUPRERA), established in 1989, but based on an older network of professionals, educators, and researchers, called *Confédération Européenne des Relations Publiques* (CERP), established in 1959.

The only book so far that gives insight into the uniqueness of Europe is *Public Relations and Communication Management in Europe*; experts from 27 countries provided insight into public relations in their countries (van Ruler & Verčič, 2004). All over Europe, universities offer programs in public relations (communication management, strategic communication, communication, information), and

academic research is a fast growing field, mostly done from a sociological perspective.

Public Relations in Old Europe

Some textbooks state that public relations arrived in Europe after World War II, together with the Marshall program. Most public relations experts in Europe believe, however, that the Anglo-American ideas mixed after World War II with existing concepts of public relations, although never referred to as “public relations” and never studied as such.

Günter Bentele placed the development of the German public relations profession in the middle of the 19th century. The first press offices in politics and business as well as in communities, associations, and corporations originated in this period. The first political press department, called *Ministerial-Zeitungsbüro* (governmental bureau of newspapers), was established in 1844 in Prussia. The middle-German town Magdeburg established a municipal press office in 1906. Alfred Krupp, founder of the steel company Krupp, established the first press department in a private company in 1870: Krupp had been aware of the necessity to hire a “literate”—as the public relations officer had been called in these days—in 1866. The duty of this literate was to read newspapers that were considered important to the firm and to write articles, brochures, and correspondences to publicize the firms and its products.

Jacque L'Etang placed the beginning of public relations in England in the 1920s. It started to play a benign role of publicizing government policy and informing the public. Local government contributed to public relations ideology through concepts of professionalism and a public service ethos. As early as 1923, concepts of neutrality and public interest became standards of respectability as public relations sought professional status.

According to Jozsef Katus, public relations originated in the Netherlands in the 17th century. Prior to that, the system for the provision of information to benefit shipping, trade, and industry on developments abroad was no longer adequate. Consular civil servants were ordered to report regularly on events in the country where they were stationed that might be important for these sectors. By gathering information in a purposeful and systematic way and

making it available to those interested, authorities began the institutionalization of government information in support of the economy.

Betteke van Ruler argued that the Enlightenment, as developed in the 18th century in France and Germany, influenced the evolution of public relations practice in the Netherlands. In the 18th century, science and knowledge were no longer seen as being relevant only for the elite but had to be diffused. The means for this diffusion was *voorlichting*. This concept is based on an expression of Immanuel Kant: *sapere aude* (literally “dare to know”), which was meant as “all people should feel the need to be informed on what is going on and have to be enlightened, so that they can take part in the ongoing debate about and development of society.” The administration as well as all kinds of civil society organizations started to introduce *voorlichters*, specialists who travelled around (they were also called “wanderers”) to give information about health, good farming, housekeeping, education, politics, etc. So, the profession as such is rather old in the Netherlands. Modern public relations departments in corporations emerged at the beginning of the 20th century. Moreover, the Dutch claim to have the oldest professional association in the world, established in 1946.

European Body of Knowledge

In October 1998, EUPRERA initiated the European Public Relations Body of Knowledge project (EBOK). The purpose of this project was to codify the existing body of public relations literature of European origin and to enable its fuller use and recognition, which was restricted by linguistic, cultural, and administrative barriers. With Karl Nessman's statement in mind—that although many ideas have crossed the Atlantic, public relations theory and practice in Europe have developed rather independently—it was questionable whether the parameters of the Public Relations Society of America (PRSA) Body of Knowledge would fit the view of public relations in Europe. EUPRERA, therefore, began to feel the need to understand what the United States and Europe have in common and how they differ, and to chart the public relations idiosyncrasies in European countries. In order to investigate these issues, a project team of people from the Netherlands, Slovenia, Sweden, and Switzerland

undertook a Delphi study in 1999 and early 2000, with participants from practice and science from 26 European countries. (For a full report of the research and the method used, see Ruler, Verčič, Bütschi, & Flodin, 2000, and Ruler & Verčič, 2002). This study gave a grounding for many issues, one of which is the naming of public relations in Europe, and second, its definition.

Defining Practice and Research

Names for “public relations” in Germanic and Slavonic languages mean “relations with the public and in the public” where “public” itself denotes a different phenomenon than it is generally assumed to mean in the public relations discipline in English. This entry takes the German term for “public relations” as an example, but similar explanations apply to other Germanic and Slavonic languages (and thus covering much of the Northern, Central and Eastern parts of the European continent). The German term for “public relations” is *Öffentlichkeitsarbeit*, which literally means “public work” and is explained as “working in public, with the public and for the public” (Nessmann, 2000). This denomination contradicts the mainstream (U.S.) understanding of public relations as management of relationships between an organization and its publics.

Ever since these Germanic and Slavonic translations of the term *public relations* had been introduced to these languages, it was obvious to the natives that their terms mean something else than the original (U.S. English) term, as Karl Nessmann argued. However, it would be wrong to just stop here with the recognition of this terminological problem as being a matter of language only. *Öffentlichkeit* does not mean “public” as in publics, audiences—it means first of all “public sphere,” and to be more specific: “that what is potentially known to and can be debated by all.” *Öffentlichkeit* is an outcome and a quality of public communication in society. By equating *public* with *Öffentlichkeit* “an analytical dimension is lost, namely that an essential aspect of public relations is that it is concerned with issues and values that are considered as publicly relevant, which means relating to the public sphere” (Jensen, 2000).

This line of public relations thinking was developed in Germany, beginning with Albert Oeckl in

1976, and in the Netherlands by Anne van der Meiden in 1978 and is represented in other European countries. These theorists reason that public relations is not only about relations with the public(s), but also creates a platform for public debate and, consequently, a public sphere. As Franz Ronneberger and Manfred Rühl argued, public relations is to be measured by the quality and quantity of the public sphere, which it coproduces through its activities. Quality and quantity in the public (sphere) relate to *öffentliche Meinung*—which can be translated as “public opinion.” This public opinion is, however, not viewed as an aggregate of individual opinions, as conceived in public opinion polling, a psychological approach to public opinion. In the sociological approach, opinion has a qualitative as well as a quantitative dimension. The quality is a type of democratic political authority, the foundation on which democracy is built, according to Jürgen Habermas. Its quantity is related to such questions as: Who is in the debate and who is not?

In this societal approach, public relations serves the same kind of (democratic) function as journalism does, as they both contribute to a free flow of information and its meanings and to the development of the public sphere: in size (“How many people are involved in public life?”), in level (“What is the level at which we discuss public matters?”), and in quality (“What are the frames used in the debates?”). Taking a cultural approach to communication, theory building in public relations is closely related to journalism in many European countries, not because the practitioners must deal with journalists, but because of these overlapping functions in society.

For many European scholars public relations produces social reality and, therefore, a certain type of society. That is why many European scholars look at public relations from a sociological perspective instead of an economic, psychological, or organizational perspective. In this respect the European use of “public” and “public relations” can mean something totally different than it typically does in the United States.

European Characteristics of Public Relations

The Delphi study mentioned above revealed no single definition of public relations in Europe but four defining and evaluative characteristics as

distinct aspects of public relations rather than as mutually exclusive views:

1. *Reflective*: to analyze changing standards and values and standpoints in society and discuss these with the members of the organization, in order to adjust the standards, values, and standpoints of the organization accordingly. This role is concerned with organizational standards, values, and views and aimed at the development of mission and organizational strategies.
2. *Managerial*: to develop plans to communicate and maintain relationships with public groups, in order to gain public trust or mutual understanding. This role is concerned with commercial and other (internal and external) public groups and with public opinion as a whole and aimed at the execution of the organizational mission and strategies.
3. *Operational*: to prepare means of communication for the organization (and its members) in order to help the organization formulate its communications. This role is concerned with services and is aimed at the execution of the communication plans developed by others.
4. *Educational*: to help all the members of the organization become communicatively competent in order to respond to societal demands. This role is concerned with the mentality and behavior of the members of the organization by facilitating them to communicate and aimed at internal public groups.

Although regional differences in Europe are understandably large, the participants of this Delphi research project accepted these characteristics as a means for defining the domain. According to statements from several countries of Europe like Denmark, Germany, the Netherlands, and Sweden, it seems to be questionable whether public relations is restricted to maintaining relationships with certain public groups. It became obvious that in many countries public relations is (also) seen as the public relationship any organization has with “society” and the search for a “license to operate” any organization needs (see Jensen, 2000; Ronneberger & Rühl, 1992). This highlights the importance of the reflective and educational characteristics (see also Ruler & Verčič, 2005).

EUROPEAN ASSOCIATION OF COMMUNICATION DIRECTORS

The European Association of Communication Directors (EACD) is the largest European network for in-house communication professionals from all industries and fields. Currently serving more than 2,200 members, the EACD was established in 2006 to foster diversity, overcome cultural barriers,

and formulate communicative norms and expectations. The association meets the needs of communication professionals working internationally, providing networks, support, and international perspectives, which are crucial to debate and embrace the exciting new challenges of an ever-changing communication landscape.

Regional Initiatives

By addressing and discussing the communication professions in both a pan-European and a regionally specific context, the EACD's Regional Events intend to strengthen the network of its members to promote the association's vision, while sharing the accumulated knowledge of all members. The EACD Regional Debates bring together public relations and communications professionals for best case presentations, informative discussions, and networking opportunities. In addition, the EACD hosts regularly Coaching Days, where qualified speakers offer intensive training sessions. In the form of two- or three-hour workshops, members can learn in depth about a particular aspect of communications.

Furthermore, the EACD members can join Working Groups, which ensure a cross-industry exchange of opinions and information. EACD Working Groups offer regular meetings and workshops to discuss specific topics and collaboration on papers and guidelines for particular issues. Currently, the EACD offers 13 Working Groups on topics such as social media, risk and crisis communications, and corporate social responsibility.

Publications, Surveys, and Services

The EACD offers a variety of publications and services to its members. In order to provide practical solutions to a wide variety of communication problems, the EACD publishes instructional service brochures written by experienced communicators. Additionally, EACD members enjoy a subscription to *Communication Director* magazine, a leading resource for information and analysis on corporate communications and public relations. Within the European Public Relations and Education and Research Association (EUPRERA) framework, the EACD cooperates with 11 renowned universities on the annual European Communication Monitor, a survey offering an overview of the working environment,

trends and challenges faced by the European communication landscape.

EACD members can also engage in an interactive social network, the EACDnet, to share knowledge, events, and job vacancies. Working and Regional Groups host their individual online platform to continue discussions, organize events, and connect with peers.

Main Events

Meeting annually in Brussels, the EACD gathers more than 600 top communication directors and spokespersons to take part in the European Communication Summit. Hearing keynote speeches and presentations by more than 70 distinguished expert speakers, participants debate strategies and tools, methods, and best cases within the different fields of European communication, such as corporate communication, public relations, media relations, and political communication.

The European Communication Award is given to the individual or institution whose communication efforts over the past year stand out on a European level. The winner of the award is voted for by members from a short list compiled on the basis of the annual results of CARMA International's CEO Stockwatch Index. Previous winners have included the European Central Bank (2008), euronews (2009), Sergio Marchionne of Fiat (2010), Peter Löscher of Siemens (2011), and Marc Bolland, CEO of Marks and Spencer (2012).

EUROPEAN COMMUNICATION MONITOR

The European Communication Monitor (ECM) is a transnational trend survey of communication and public relations practice in Europe conducted

annually since 2007. It has developed into the most comprehensive research into communication management and public relations worldwide with 2,185 participating professionals from 42 countries in 2012. Each year the ECM improves the understanding of the professional practice of communication in Europe and monitors trends in strategic communication to analyze the changing framework for the profession. The ECM is supported and organized by the European Public Relations Education and Research Association (EUPRERA), the European Association of Communication Directors (EACD), and *Communication Director* magazine. This alliance is supported by industry sponsorship from Ketchum Pleon.

The research framework includes variables along five key factors: personal characteristics of communication professionals; features of the organization; attributes of the communication function; the current situation of strategic communication; and perceptions on future developments.

In 2012, research questions were introduced about ethical challenges and standards; professional accreditation and certification systems; the practice of communication in organizations; integration and coordination of communications; professional training and development; management, business, and communication qualifications; and recruitment of young professionals.

The monitor is based on a range of theories about public relations and communication management including reflective communication, integrated communication, corporate communications, and strategic communication. Other examples are theoretical concepts such as polyphony of communication, communications competencies and skills, ethics and moral conduct, and professionalization.

EUROPEAN PUBLIC RELATIONS EDUCATION AND RESEARCH ASSOCIATION

The European Public Relations Education and Research Association, EUPRERA, is a leading

European nonprofit association promoting education, research, and practice of public relations in Europe. It represents more than 600 public relations professionals across 50 different countries. It was founded in 2000 and is legally based in Brussels, Belgium. The association has four major objectives:

1. Stimulating knowledge creation, dissemination, and exchange of all forms of European public relations research
2. Sustaining cooperation and partnerships among its members to advance ground-breaking European public relations research, education, and practice
3. Promoting public relations education across countries that is connected with professional practices
4. Supporting and disseminating the development of novel public relations methods

Based on its goals, the association's primary target groups are academic staff, researchers, students of universities and institutions offering public relations programs, national organizations, and to some extent practitioners interested in research and education. To achieve its objectives, the association is mainly involved in four activities:

1. The organization of annual conferences and spring symposia
2. The organization of PhD seminars
3. The promotion and support of pan-European projects in public relations education and research
4. The recognition of excellence in public relations research through different prizes and awards

A major contribution of EUPRERA is the organization of its annual conference, in collaboration with a selected university in Europe, which takes place every year in a different country. The annual conference has become the major venue for European and international scholars to present, share, and discuss the latest developments and research in public relations. Since 2007, PhD seminars for doctoral students in public relations and communication management are held just before

the annual conference. During these seminars, doctoral students can present their ongoing work, get feedback from senior scholars and peers, and establish a valuable network for the future careers.

Since 2008, spring symposia are also organized in different European cities. The scope of organizing spring symposia is mostly managerial and project related. Spring symposia are primarily meant to help members in developing and strengthening new or existing partnerships, to debate important matters related to the business and management of the association, and to present new project proposals or discuss together existing projects. Projects can deal with educational matters, such as the MARPE (Master in European Public Relations) project, or knowledge creation such as the European Communication Monitor project, which investigates the status of the practices of public relations and communication management in Europe. Each member can propose a new project, but an approval by the board of directors is needed to be officialized. Besides the spring symposia, EUPRERA offers its members the possibility to access its network, which can help them in coordinating different research efforts, including helping project members to search and obtain funds.

Central to EUPRERA's mission is the development of a body of knowledge and expertise in European public relations and the recognition of novel theoretical and practical approaches in public relations. The association awards each year the Euprera Jos Willems Award for best bachelor thesis and the Euprera Jos Willems Award for best master thesis and every two years the Günter Thiele Award for best dissertation. The latter is given in partnership with the University of Leipzig's Foundation for the Support of PR-Studies (SPRL), Germany. The award ceremony takes place during the annual conference and winners are invited at EUPRERA expenses to come and present their work.

History and Structure of the Association

EUPRERA was established after CERP Education and Research, a subgroup of CERP (*Confédération Européenne des Relations Publiques*—European Confederation of Public Relations). Due to the growing emergence of public relations programs in European universities, Jos M. Willems, prior president and secretary general of CERP Education

and later of CERP Education and Research, and other members of CERP Education and Research felt the need to become independent from the confederation and to dedicate their energies to promoting public relations education and research. During the General Assembly held in December 2000 in Milan, Italy, the members voted for the constitution of a separated and independent organization, which was called EUPRERA. Because of his role played in public relations education and research, Willems is considered the founding father of EUPRERA.

The main authority of EUPRERA is the General Assembly, which consists of all registered members. The General Assembly meets yearly, usually during the annual conference. An executive board of five members, including a president (either the past president or the president elect), a public relations and administration director, and two executive directors, comprises the EUPRERA Board of Directors. The board's main task is to manage the operation of the association, the budgets, which are set by the General Assembly by all voting members, and the running of all projects. All positions are based on a general election in which EUPRERA members choose the candidates from a pool of nominees for a 2-year term. The president is elected from the board of directors and represents EUPRERA to its external publics, at the General Assembly and at official occasions. The working languages of the association are English and French. French is the only language used in legal matters as the association is registered and governed by Belgian law, whereas English is the official language used by the board of directors, the General Assembly, and in all main activities.

EUPRERA is mostly financed through its membership fees and sponsorships. In some instances, for example, in relation to some pan-European research and educational projects in the domain of public relations, the association can obtain sponsorship from project corporations and national public relations associations, as well as some funding from supranational organizations (e.g., European Union, UNESCO, trusts, and foundations).

EUPRERA has become a leading association to promote the exchange of information among its members about educational models, programs, and academic courses; to confer about educational standards and programs; and to promote the

development of a body of knowledge in European public relations research. The association is a member of the Global Alliance for Public Relations and Communication Management and it has established cooperation with many international associations in public relations, communication management, and business communication.

EUROPEAN SOCIAL THEORY AND PUBLIC RELATIONS

Using social theory to understand public relations recognizes the importance of cultural, political, technological, and economical environments of organizations. Among scholars working within this tradition, public relations is seen as a social activity where organizations are embedded in social environments and governed by structural preconditions and thereby altered through organization–environment relations. In other words, it is a tradition describing organizations as parts of social webs that constrain and enable practices and thus, rather than individuals or organizations, society is stressed in the analysis of public relations.

A general feature is to offer diagnoses of the present and analysis of the interconnectivity of the past and the present. For instance, it asks questions such as what social changes could be related to the development of public relations and how has it been used to promote or obstruct social changes? At heart, are the communicative aspects of public relations—the construction and interpretation of meanings and discourse practices—the essential feature of the practice?

Scholars in this stream of research rest their work on such contemporary social theorists as

Jean Baudrillard, Ulrich Beck, Pierre Bourdieu, Michel Foucault, Anthony Giddens, Jürgen Habermas, Bruno Latour, Niklas Luhmann, and Jean-François Lyotard, and even to such classical theorists as Karl Marx and Max Weber. This is not to say that these theorists have shown particular interest for public relations. Apart from Habermas, who criticized it for its contributions to the decline of the public sphere, the social arena where citizens meet to reach consensus in matters concerning the common good by the use of open-ended discourse and rational argumentation, there are no references to, or analyses of, public relations in the work of these theorists. Instead their work is used by public relations theorists as a framework to analyze and interpret public relations activities.

By using the label *social theory*, the structural dimensions are put forward in the work of these theorists; but social theorists take very different standpoints in ontological, epistemological, and axiological issues. Social theory is, among social sciences in general a diverse concept. In some cases, the work could be unified under a common tradition as *postmodernism* (a tradition arguing for a “crisis in the social sciences,” as the idea of an objective truth is seen as obsolete), *critical theory* (a tradition where the aim of research is seen as to uncover injustice in society and show the path for equality and democracy), or *structuralism* (a tradition where the actions or functionalities of singular elements are seen as consequences of structural conditions).

In other cases the unifying component is the conceptualization used as *social structures* (the framework of institutions, roles, positions, and relationships regulating the actions of social actors creating continuity over space and time), *reflexivity* (the ability of social actors to escape structural conditions and critically investigate the conditions for their own practices), or *trust* (a dimension of social interactions where one actor is willing to rely on another actor in a situation where there is lack of information about future circumstances).

Additionally, scholars are unified by their interest in certain themes: *structural transformations* (social changes and their drivers, consequences, and dynamics), *power* (the distribution of resources and other circumstances regulating the positions between social actors), or *risks* (threats to human existence). However, despite certain similarities in

traditions, concepts, and issues, it is impossible to place social theorists in a unified paradigm.

These traditions, conceptualizations, and issues are represented in research on public relations. This diversity in interests and assumptions is reflected when the works of social theorists are used to analyze public relations. The unifying element is not so much theoretical standpoints, conceptualizations, or the issues studied; rather it is an idea about the aims of research.

Approaches

There are two main approaches among scholars using social theory to analyze public relations: (a) an analytical approach and (b) a normative or critical approach. The former features *understanding* as the primary aim of their research. By that, they want to overcome the ideas of simple causalities between actions and effects where social actors are reduced to objects and social activities are reduced to mechanisms. The ambition is not to prescribe or explain the use or effects of certain models, approaches, or strategies; instead, scholars want to make sense of public relations and comprehend the practice and its conditions and consequences.

Those holding a critical approach take a normative vision where the practice is scrutinized in regard to societal ideals. Here the aim is to critically examine whether the use of public relations contributes, promotes, counteracts or obstructs transparency, equality, participation, and other values regarded as socially desirable. In both approaches the organization in itself is not seen as the main object. Instead, focus rests on the social contexts as well as roles, functions, or positions organizations and other social actors holds in these circumstances and how they use public relations to create, recreate, change, or fulfill these conditions.

Themes

The questions raised by scholars using social theory are diversified and vast; however, there are two returning themes building the core of the tradition.

1. *What structural conditions promote, counteract, or sustain the practice of public relations?*

Here analytical scholars have pointed toward the industrial revolution and how it entails a replacement of traditional forms of production and organization with forms promoting rationality, predictability, and efficiency. This leads to specialization and a division of labor where communication in conjunction with other means becomes an instrument to gain control over production. Additionally, public relations becomes a means used to construct an appealing appearance to attract investors, separate mass-produced products from others, and ensure support from stakeholders. These usages of public relations are intensified as the industrialization develops and takes new forms.

Globalization, individualization, mediatization, and other forms of transformation lead to contradicting and inconsistent requirements and increasing complexity where public relations becomes a managerial tool frequently used for interactions and identity constructions. Similar developments are pointed out by critical scholars but here the developments of capitalism are at the core and the use of public relations is featured as a means to gain ideological control. Thus, scholars point out how the development of public relations is intertwined with development of modern mass media and the commoditization of audiences where individuals are reduced to consumers and where media content and public relations aim for the legitimization of capitalistic system.

2. *What consequences does public relations have for society as a whole, certain spheres (markets, civil society, culture), certain situations (war, elections, crises), or certain groups of actors (women, employees, minorities)?* Here critically oriented scholars have shown how public relations is used as a strategic means by prominent actors to gain positions and resources and, by that, gain dominance. By the use of systematically distorted communication, they promote institutional goals, products, images, and ideologies to sustain or resist social changes. As discourse is seen as essential for how we perceive the world and things around us, public relations becomes a tool for domination and for the distribution of privileges and reproduction of social orders. In line with this analytical approach, scholars argue for a constructivist perspective where public relations is seen as an important aspect of how collective ideas and

perceptions are constructed. However, rather than see the use of public relations as something restricted to prominent actors, analytical scholars have shown how public relations is used by a number of different types of actors with competing aims and different consequences.

EVALUATIVE RESEARCH

Evaluative research is a relatively new area of public relations, which provides tools to systematically measure the impact of public relations campaigns and strategies. The foundation of this discipline consists in the belief that the effectiveness of public relations is measurable. However, a question mark still exists concerning whether public relations programs can be monetized through evaluative research. On one hand, scholars who believe that public relations is rooted in social science recommend the use of both quantitative and qualitative evaluative methods. On the other side of the spectrum, marketing-oriented scholars believe that evaluative research should only be comprised of quantitative methods. A review of the development of evaluative research should provide a general

understanding of the two approaches that currently exist in evaluative research. In addition, this entry provides an overview of the practitioners' approach to evaluative research.

Public relations evaluation became a widely discussed topic more than 60 years ago, when the need of a more complex evaluation system emerged. The scholastic literature can be tied back to the measurement of attitudes in the 1920s. After World War II, evaluation studies were mostly U.S.-based and either business or mass communication oriented. Two decades back, Walter K. Lindenmann established a cornerstone in evaluative research when publishing his "Effectiveness Yardstick" study. Trying to overcome the hasty judgments of the era, Lindenmann established three levels of evaluation on a vertical progression: output, outgrowth, and outcome. The outputs represent the basic level of measurement for an organization. At the second level, public relations professionals should possess more complex research skills and knowledge. The outgrowth measures the attention, understanding, and retention of messages. In order to measure these elements, practitioners should use a wide spectrum of research methods, both quantitative and qualitative, such as focus groups, in-depth interviews, and extensive polling. At the last and most sophisticated level, public relations practitioners should have advanced knowledge of research. The outcomes measure the attitude, opinion, and behavior change. To do this, experimental and quasi-experimental observation, participation, audits, data analysis, and before-and-after polling could be used. The scholars that followed Lindenmann emphasized that evaluative research should be entirely tied back to the objectives of the public relations campaign.

The evaluative research in marketing is based on the core belief that public relations programs are economically embedded and their outcome should reflect in the return on investment (ROI) and, eventually, in sales. If following this approach, public relations practitioners would monetize the outcome of their activities by using media metrics and evaluating promotional events. ROI is predominantly used in media relations. One way to account for ROI is by comparing the amount of money invested in a public relations campaign to the outcome, in terms of attitude or behavior

change. For example, if a media campaign for a new detergent generated 50,000 impressions and the value of those 50,000 impressions is \$1,000,000 that means that one should have invested less than \$1,000,000 in order to obtain revenue.

A more controversial marketing-oriented evaluative research consists in advertising value equivalencies (AVEs). Scholars tend to disagree with this approach, but some practitioners are still using AVEs to quantify their public relations efforts. To calculate AVEs, the media coverage is converted to the price of paid advertising within the same media outlet. This value is then multiplied and adjusted according to the number of words or paragraphs, tone, position on the page, and so on.

Besides these two core differences between the social science and the marketing-oriented approach to evaluative research, discrepancies exist between how scholars and practitioners view evaluative research. Although scholars discussed a holistic approach to research, practitioners have mostly used two types of evaluative methods: outputs and outcomes. In analyzing events and media coverage, public relations practitioners predominantly use metrics such as attendance to meetings, media monitoring, and media content analysis. Despite this limitation, public relations associations have been struggling to create common evaluative research standards. In the United Kingdom, the Chartered Institute of Public Relations (CIPR) has become a leading forum on public relations evaluation, while in the United States the Institute of Public Relations (IPR) has a leading role. The organization has published evaluation guidelines and a series of articles about public relations measurement in different industries. In the United States, IPR at the University of Florida has taken a role in educating the public relations professionals on best practices of evaluation and measurement. IPR has published many papers written by practitioners, including a dictionary of public relations evaluation terminology. These papers explore a large spectrum of issues, from how to link the evaluation to the corporate objectives or how to measure public relations in the nonprofit sector, to the importance of ROI and proving the value of public relations.

Following the chronological development of public relations evaluation and measurement, one should not overlook the European Summit on Measurement, which reached its fifth edition in

2013. The summit has attempted to establish a set of evaluative principles. The foundation stone was set during the second summit, when a set of seven principles were established:

- the importance of goal setting and measurement
- measuring the effect of outcomes is preferred over outputs measurement
- the effect on business results can and should be measured
- media measurement requires quantity and quality
- AVEs are not the value of public relations
- social media can and should be measured
- transparency and replicability are paramount to sound measurement

Although these principles are still not largely used, the European Summit on Measurement aims to educate public relations professionals and generate common practices.

Thus, evaluative research is still in its early beginnings. Public relations scholars should work on developing the existing models and a theory, while practitioners should try to reduce the dissonance between what should be done and what is done.

EVENT MANAGEMENT

Event management, also known as special event planning, provides a valuable tool by which for-profit and nonprofit organizations specialize public relations campaigns. Event management is a means for achieving publicity and recognition for their organizations and establishing and maintaining relationships with key constituents through direct contact. When executed well, event management can add greatly to the profile and prestige of organizations.

Types of events utilized by organizations include new building dedications, fundraisers, product launches, board meetings, and community or arts sponsorships. While the different incarnations of special events are limited only by the imagination, the primary categories of special events are open houses, fundraisers, project groundbreaking or completion, holiday celebrations, grand openings, promotions, and commemorations and anniversaries.

Special Events Defined

Special events represent those circumstances in which organizations have to deviate from communication-driven public relations, advertising, and marketing efforts by meeting directly with clients. Some events may have a non-media-related purpose, though typically they are structured to fit within the framework of the organization's public relations plan. They facilitate direct communication with customers, often by bringing them to a business or institution, though they may occur at a designated third-party site.

An event can enhance organizational image by presenting a company as proficient and professional, thereby adding to its prestige. In so doing, they provide "ready to be consumed" media images and stories that can achieve third-party support for public relations efforts.

Many special events for nonprofit organizations are organized around a fundraising theme or purpose. They frequently are designed to provide people with a meaningful experience by which they enjoy participation or entertainment in exchange for a donation to a worthy cause or a political candidate.

Factors in Successful Special Events

To be successful in developing effective special events a number of factors should be considered. First, in order to generate media attention, an event should be newsworthy in its own right. Second, events work best when there is a meaningful link between an organization and the event, such as efforts by women's fitness apparel companies to fight breast cancer (health). Third, if there is to be a product link, it should be evident but not intrusive; more direct approaches tend to turn consumers off. Finally, the event itself should be well planned and executed in order to make the experience distinct and memorable.

How to Plan Special Events

When planning a special event, there are a number of important considerations to take into account. First and foremost, a special event needs to be a part of a larger public relations plan. It should follow traditional public relations techniques of research, planning and budgeting, implementation, and evaluation. Furthermore, an event must be promoted effectively to generate both media and public interest.

While standard public relations practices are necessary, special events do have a number of unique characteristics that require specific planning and focus. While attention to detail is necessary in all public relations activity, it is even more critical in event management; success depends on the mastery of numerous small details.

From start to finish, an event planner must keep in mind several important concerns. First, care must be taken in choosing the timing and location of the event. The event must not conflict with other major events. If the occasion is to be held outside, contingency plans regarding weather must be made. Additionally, thought must be given as it concerns signage, transportation, and reception, as well as necessary banners and other promotional materials that effectively represent the organization's image. There also is the problem of providing tickets; tickets provide event managers a means by which to gauge interest and to manage attendance; yet the distribution of tickets is never problem free.

Another feature of special events is that they characteristically require production and technical

assistance in the form of a stage, audio-visual equipment, microphones, and lighting. If they are not already in possession, most of these types of equipment, as well as tents, booths, fences, tables, and portable generators, are available for rent.

Special consideration revolves around the choice of food and beverage and must take into account the image the organization wants the special event to promote as well as modern drinking and dietary habits and concerns (vegetarianism, food allergies). The same concerns often surround the need for entertainment. Entertainment must not offend, be booked and paid, and again, reflect positively on the organization.

Risk management is a further concern. It clearly goes without saying that safety procedures need to be spelled out and followed. Contingencies that must be planned for include the weather, illness, heart attack, and overconsumption of food or drink; as a result, if liability insurance is not enough, necessary insurance riders must be procured for the event.

A major issue of event planning is that of security—both in keeping unwanted guests or activists who would seek to disrupt the event out as well as to ensure the safety of those who are inside.

Finally, though it is less than glamorous, proper sanitation requires attention. Indeed, some companies have taken to renting trailers with generous “powder rooms” to get away from the indignities of port-a-potties. Planning should take into account the collection and disposal of trash.

EVOLUTION OF PUBLICITY AGENCIES

As did other corporate specializations during the 19th-century industrial revolution, the evolution of publicity agencies progressed naturally, organically. Practitioners who innovated publicity agencies learned their practice and its distinguishing characteristics in the service of various employers or individual clients. These often were politicians, but they also included large companies and non-profit organizations that were just beginning to learn the value of professional communications. The evolution of mass media, competitive industries, government programs, war, and industry led to many specializations as activities became routine, named, and professionalized.

Practitioners for many enterprises learned and honed the skills necessary to make their employers and clients “public.” In 2010, Kirk Hallahan (2010) emphasized how organizations need to be known; publicity is a strategic function for accomplishing that goal. The skills, opportunities, and abilities that characterized 19th century industrial changes demanded publicity. Professionals were increasingly willing to meet that need.

P. T. Barnum honed the skills of publicity and promotion in the mid-19th century. He needed a large market to sustain his spectacles. He needed to create awareness for what he offered and differentiate his show from his competitors who also were engaging in publicity.

The same was true of railroads. They were perhaps the most important industry of most of the 19th century. Owner and investors were often granted land to create rail systems. They needed to publicize the potential profits of such investments. They also needed to attract populations to areas opened by the railroad. That provided revenue from passengers as well as freight to and from new towns.

Thus, what came to be called public relations was a developing professional practice by the onset of the 20th century. The skills developed in many countries and for various reasons were now being bought and sold as professional services, through what came to be called publicity agencies. The standard tactic of the practice was press agency.

Professional publicity and promotion occur in two forms. The practitioner either works in an agency–client relationship or as an employee. The person or team is employed and charged with the responsibility of attracting attention, forming positive or negative attitudes, and motivating individuals to move toward outcomes sought by the sponsor.

This model of publicity and promotion was not unique to the 19th century, but became tailored to the societal and commercial interests and the available means of communication unique to the era. What became well-established professional agencies in abundance in the 20th century started as in-house operations or one-person services in the 19th century. Thus, to understand the practice as it is known today, we need to know how agencies began and evolved.

The first publicity agency in the United States was formed in Boston under the name Publicity Bureau. It was the amalgamation of the talents of George V. S. Michaelis, Herbert Small, and Thomas O. Marvin. The exact history of the firm is clouded in mystery, but it formed in the first years of the 20th century. Its client list included Harvard University. The men who forged this agency, like previous decades of peers in the trade, had come to publicity through the experience of newspaper work. Knowing the wiles and ways of journalism, they understood how journalists looking for stories wanted individuals to interview and copy that could be readily incorporated into the next newspaper edition or magazine issue.

The utility industry engaged local newspapermen to get stories into print that could favor one company's interests against those of another. In the Battle of the Currents (late 1880s and 1890s), George Westinghouse, aided by Samuel Insull, arranged for local newspapermen to write stories featuring the benefits of alternating current. This engineering and business initiative was opposed by Thomas Edison, who used similar tactics to applaud the safety of direct current.

Edison used a variety of publicity stunts and government relations in an effort to paint alternating electrical current as unsafe and thus an unwise industrial standard for electricity use in people's homes.

The evolution of the publicity bureaus was the natural progression of the emerging mass communication industry. News hounds and editorial writers, as well as feature story journalists, were creating a market for news by, among other tactics, finding fault with industrial barons. Bad news sells newspapers. But so does product publicity. Large industries created and responded to growing mass markets. National industrial and commercial complexes supplanted local businesses. Industrialized products began to supplant products sold by local word of mouth and established local manufacturers. To create and reach mass markets, publicity attracted attention and created brand awareness through mass media.

The Civil War was a battle of regions as well as of news stories. Careers of generals and presidents hung in the balance between favorable and hostile news stories. Out of this experience arose the American Red Cross, through the publicity and promotion efforts of Clara Barton. She and other reformers called for corporate, government agency, and private citizen support to identify, understand, and solve social problems that were often associated with poverty, disease, and disaster.

The evolving publicity bureaus recognized the link between corporate and robber baron image and a willingness to serve society. The amassing of wealth carried with it the stigma of ruthlessness. To soften this image, countless barons made philanthropic contributions and thereby fostered the future of nonprofit agencies. Publicity bureaus were a means for bringing the industrial baron and charity together. Once the relationship was forged, publicity was used for both parties. Names such as Rockefeller and Carnegie became widely associated with philanthropy, thanks to the work of experts in publicity. Favorable publicity was often an answer to the ostensible evils of amassed fortunes, unfair labor conditions, poverty, disease, and other economic disadvantages.

Early on, agencies realized the virtue of client relationships. They built personal and professional relationships with their clients, blending the

interests of the agency and the client. They knew that the continuing and future business for their agency depended on the ability to make a difference for clients. The leaders of these agencies recognized that success led to more success.

One of the earliest publicity firms formed and eventually combined the talents of George F. Parker and Ivy L. Lee. Parker contributed his journalistic skills, knowledge of the media, and desire to achieve clients' goals to one of the first publicity agencies. By 1904 when he helped found Parker and Lee, he had years of experience working for Democratic political organizations and major candidates. He had played a key role in the election of Grover Cleveland to the presidency of the United States in 1884. He understood the subtleties of message positioning and media relations. He wrote and placed stories. He staged events. He created excitement and organized rallies. He knew what reporters believed to be good news fodder and was able to provide it for his candidates and against their opponents. By the early 1890s, he had opened a small office in New York City that served as campaign headquarters. He recognized that reporters need to know where to find people who know where and how stories are developing. Parker was able to share these vital skills and well-honed best practices with his new partner, Ivy Lee, who became legendary for the development of client relationships and tactical options.

The history of public relations is inseparable from the needs of an individual or organization to be public, to get out its messages; agencies resulted from recognition by certain persons that they have special skills that can be sold. Where the profession goes and how it matures are uncertain, but it will forever wrestle with the aura of the professional who can influence media coverage and content. The early publicity bureaus knew this fact and sold their services, and sometimes their souls.

EXCELLENCE THEORY

Excellence theory explains how public relations as a management function can contribute to the planning and response processes necessary for organizational effectiveness. *Excellence* was the term adopted from management theory to represent the theoretical foundations for the landmark study funded by a \$400,000 grant from the International Association of Business Communicators (IABC) Research Foundation. The excellence study, headed by James E. Grunig, resulted in the publication of three books: James E. Grunig's 1992 *Excellence in Public Relations and Communication Management* (theory and literature review); David M. Dozier, Larissa A. Grunig, and J. E. Grunig's 1995 *Manager's Guide to Excellence in Public Relations and Communication Management* (principles for implementing the research findings); and L. A. Grunig, J. E. Grunig, and Dozier's 2002 *Excellent Public Relations and Effective Organizations: A Study of Communication Management in Three Countries* (findings and theoretical refinement of excellence theory). The 2002 book observed, "The major premise of the excellence theory states that communication has value to an organization because it helps to build good long-term relationships with strategic publics" (p. 57).

The excellence study spanned over a decade and quantitatively studied 312 organizations on an international level; it included qualitative research in 25 of those organizations. It included organizations of all types, including corporations, government agencies, nonprofits, and associations. The team of researchers sought to identify key factors that make public relations "excellent" in its contribution to organizational effectiveness, its role as a management function, and the ideal

internal composition, structure, and role of the function. The organizations selected to participate in the excellence study either had records as excellent communicators and served as best-case exemplars or were known for poor communications, serving as examples of what impedes effective public relations.

By reviewing literature drawn from many disciplines, the team developed and tested theoretical propositions. Those propositions and research-based conclusions helped to form the excellence theory and were refined into the principles of excellence.

Factor analysis of the data, the mathematic search for data clustering around underlying patterns, revealed what the researchers labeled the “excellence factor.” The excellence factor comprises several characteristics that span organization size and type, culture, and other influences, allowing them to be labeled “generic” principles of excellence. These characteristics are the backbone of the excellence theory, providing a normative yet practical guide for how public relations can make the maximal contribution to an organization.

The excellence factor consists of 10 principles of excellence that apply generically across organizations, industries, sizes of enterprise, and cultures:

1. *Value of communication*, as seen by the CEO and top management of an organization. CEOs who placed higher value on public relations favored a communication function in their own companies with many of the attributes of excellence and were likely to have more effective public relations units. Senior public relations practitioners in these organizations were likely to participate in the overall strategic management of the organization.

2. *Empowerment in the dominant coalition to contribute to strategic organizational functions*. Active participation in strategic planning is necessary for public relations to contribute to organizational effectiveness, but access to the high-level process is difficult to attain. Public relations contributes frequently in the organization’s response to social issues and routine operations. It contributes less frequently to strategic planning, except in organizations in which the CEO places high value on the public relations function.

3. *An integrated public relations function*. This allows public relations to work harmoniously across the organization, with other functions, toward strategic goals. Public relations should not be subsumed by marketing or vice versa, but the two functions should work side by side. Integrating the public relations function allows it to facilitate communication across many departments or functional areas in an organization, staying consistently on message.

4. *Headed by a manager rather than a technician*. Public relations roles can be divided into the broad categories of *technician* (based on skill sets such as writing) and *manager* (based on business management knowledge such as research and advising). Senior public relations practitioners who perform primarily a management role rather than a technical role contribute to organizational effectiveness and excellence in the communication function.

5. *Model of public relations preferred by an organization*. Four models of public relations were examined: press agency (publicity), public information (dissemination of accurate information), two-way asymmetrical communication (scientific persuasion), and two-way symmetrical communication (mutual understanding). Both two-way models are based on research; both one-way models describe a simple output of communication. Although the two-way asymmetrical and the two-way symmetrical models are effective and present in excellent organizations, the two-way symmetrical model provides a vehicle for dialogue with publics. Dialogue through the symmetrical model results in long-term relationship building and maintenance. Therefore, the two-way symmetrical model is deemed the most excellent approach to conducting public relations.

6. *Knowledge of the communication department to actually practice the ideal type of excellent public relations*.

- The knowledge of *research methods* required to implement the two-way models poses a problem for some practitioners, limiting their potential for excellence.
- Knowledge of *managerial functions* such as budgeting, evaluating research, managing a

staff, and planning goals and objectives, is necessary for excellence.

- Knowledge of both *research and strategic management* must be present and used for public relations to contribute at the highest level.

7. *Activist pressure to force the organization to communicate with external publics.* The excellence study found organizations with higher levels of activism pressure had higher levels of successful public relations. Activist pressure encourages public relations to tackle important issues of organizational policy, to proactively manage issues, and to contribute at higher levels of strategic planning in the organization.

8. *Organizational culture, structure, and other employee-related variables.* Organizations with participative rather than authoritarian cultures, and organic rather than mechanistic or highly stratified structures, produce more efficacious public relations. Symmetrical, dialogical systems of internal communication and high levels of job satisfaction contribute to excellent public relations.

9. *Embodying diversity,* particularly in relation to the status of women in a female-dominated profession. Researchers hypothesized that a diverse public relations department could better understand and represent diverse publics in the organization's environment.

10. *Ethics and integrity* embodied across all roles in the public relations function, but specifically in advising top management (Verčič, L. A. Grunig, & J. E. Grunig, 1996; Bowen, 2008, 2009). Ethics take on a central role in the public relations function when building credibility and strong relationships with publics, in issues management and in crises. Top public relations executives not only act as ethical counselors to their CEOs and dominant coalitions but also offer input on the values of publics.

Organizations with a rigorous ethics training program and codified decision-making paradigm were more excellent than those that simply attempted to be ethical without investing resources in defining, training, and analyzing ethics.

Excellence theory provides a normative guide for how public relations should be conducted,

structured, and implemented. It delineates the factors that help public relations contribute to organizational excellence. This study provides empirical evidence to support the principles of excellence, and it explains how and why certain factors contribute to outstanding public relations. Pressure is increasing on many public relations professionals to justify expenditures on communication, to show how the function contributes to the bottom line of the organization (return on investment), and to show that nebulous concepts such as corporate reputation translate into a competitive advantage. Excellence theory shows that public relations does enhance the operation of an organization by maintaining two-way, balanced communication with the publics on whom the organization depends. Most importantly, excellence theory offers a way in which public relations can contribute to both organizational rectitude and the flow of communication in society for the good of the citizenry—in an *ethically responsible* manner.

EXECUTIVE MANAGEMENT

Executive management consists of the personnel at the top of the organizational chart. Currently the term *C-suite* is used to refer to these corporate leaders.

These executives are charged with conceptualizing and operationalizing their organizations. They set the mission and craft the vision of the organization, create and implement the budget, lead strategic planning, and foster the organization's reputation and internal culture. They select operating standards, design and defend brand equity, foster the culture of the organization, and set the tone for the quality of relationships that are developed and maintained with the organization's stakeholders, including investors, markets, publics, and targeted audiences. Although they realize they must adapt their organization to the environment in which they operate, they often work to bend society to the satisfaction of the organization's need for resources.

The executive management team is divided by function. Function heads take their titles from the unique activities, functions, structures, and disciplines for which they are responsible. The person at the pinnacle of the organizational chart is the chief executive officer (CEO). In most organizations, whether business or nonprofit, this person reports to a board of directors. The typical executive arrangement empowers the board to hire, fire, and reward a CEO. The board helps set the direction—mission and vision—of the business, as well as advises its strategic planning. Nonprofits often have a similar arrangement; for instance, the CEO of a university is the president (or chancellor), who reports to a board of trustees. Many foundations and charitable nonprofit organizations

have a similar structural arrangement, with a board serving in a planning oversight capacity.

Beneath the CEO is a layer of executives, each one of which is responsible for her or his set of functions. The chief financial officer (CFO) or treasurer is accountable for the financial health of the business as well as its compliance with Securities and Exchange Commission regulations, in the case of a publicly traded company. The chief operating officer (COO) is responsible for the operations intended to make the organization successful because they generate revenue. Rare is the organization that does not have some variation of CEO, CFO, or COO—by whatever title. The CEO might also be president or the COO might be president, especially if the CEO is chairman of the board.

Various organizations, depending on their nature and position in any economy, will have additional function heads at the C level, or the persons at this level might hold the title of executive vice president, vice president, or manager. The specific titles are sensitive to the culture of the organization and the industry or nonprofit sector where it operates. Persons at this level might be in charge of marketing, public relations or public affairs (or corporate communication), technology, domestic activities, global activities, manufacturing, and other areas. In the nonprofit world, a typical title at this level would be the chief development officer, who is in charge of raising money.

The executive management team creates and manages the organization using a set of strategies framed in terms of management by objectives. In the broadest terms, it selects a set of desirable outcomes and formulates a budget to support the strategies needed to achieve these outcomes. Formulation of the budget is the means by which the organization applies revenue to achieve its mission and vision.

Executives are responsible for line and staff functions. A line function is anything that is vital for the success of an organization. For instance, in a manufacturing company, its manufacturing operations would be a line function. Staff functions are advisory to the persons who are responsible for line functions. In many organizations, legal counsel and public relations serve in staff capacities. Persons thus work in a matrix whereby key sets of line

and staff functions are interdependent for the success of the organization.

In companies that are primarily committed to marketing, public relations may be a line function supporting the marketing effort. In other companies, such as multinational petrochemical businesses, public relations is likely to be under the public affairs functions and operate as staff. As such, the public relations persons are responsible for helping to create and implement the communication philosophy and strategies of the organization.

In organizations committed to issues management, senior public relations personnel are involved in strategic planning, the development of standards of corporate responsibility, issue monitoring, and issue communication. This structure is most typical of businesses that work to positively position themselves in the public policy arena as well as engage in traditional marketing activities.

Businesses with a serious commitment to public relations may have a chief communication(s) officer (CCO), who is responsible for the communication function. As such, the person is likely to be a member of the executive cadre that develops the rationale and methods for fostering relationships, including dealing with activists and other stakeholding publics.

Relevant to the practice of public relations is the level in the organizational chart held by the most senior practitioner. The culture of many companies dictates the disciplines that persons must have mastered to serve at the highest levels by whatever name. For example, multinational petrochemical companies may have an engineering or legal counsel bias that results in communication personnel not rising above manager levels. In companies where marketing is the primary culture, public relations reports to marketing and is primarily limited to publicity and promotion.

For over a century, senior practitioners and leading academics have recommended that the counseling function of public relations be vital to the success of any organization. Public relations personnel can support the organization's efforts to raise revenue, but they can also help it reduce costs if effective public relations and human resources collaborate to reduce turnover and build the organization as one that is preferred by workers. Costs may be reduced by having effective

customer relationships and more collaborative rather than contentious relationships with activists. The same is true for public relations counsel prior to, during, and after a crisis. Senior practitioners can also serve as a vital part of the conscience of the organization, providing insight to ethical challenges.

EXPERIMENT/EXPERIMENTAL METHODS

An experiment is what John Hocking, Don Stacks, and Steven McDermott have labeled the *sine qua non* of all research. The experiment is a carefully controlled research study that allows the researcher to state within certain limits that a relationship exists between two elements and what causes the relationship to change. The experiment, as John Pavlik has lamented, is underrepresented in public

relations, partly because of a limited theoretical base and the applied nature of public relations. Another reason for its lack of use may be the 24/7 nature of public relations practice.

The experiment is a very powerful research method that is extremely limited in its ability to generalize to other situations. The limitation is based on the fact that the experiment requires as much control as can be placed on the actual implementation of the study. When an experiment is conducted, the researcher attempts to keep all other influences constant, varying only what is manipulated (the “independent” variable) and observing its effect on the “dependent” variable. The dependent variable, then, is dependent for its result on the manipulation of the independent variable. Because most experiments attempt to test a theory that makes predictions based on the relationship(s) between the independent variable and the dependent variable, an experiment predicts—or hypothesizes—the expected relationships. On the basis of a theory, the experiment is conducted, data are collected, and the results are submitted to a statistical analysis in a way that allows the researcher to state with a certain degree of confidence that the experiment’s results were based on hypothesized relationships and not on measurement or other types of error. Error is what the experiment attempts to reduce when the researcher establishes control.

There are a number of different experiments, each based on the degree of control placed on the study. The most controlled experiment is the laboratory experiment, where the researcher attempts to keep all possible sources of error—“spurious variables,” as Donald Campbell and Julian Stanley (1963) call them—out of the study. Relaxing control somewhat results in an experiment that simulates what happens when other variables are allowed to influence the hypothesized relationships. Relaxing the study even more results in a field experiment, where the study is conducted in a natural environment, but still with certain degrees of control.

Relationships, Causation, and Control

To better understand what the experiment does, one must understand relationships, causation, and control. A relationship in public relations

would be a tactic (independent variable) and the outcome expected (dependent variable). Thus we would expect a particular relationship if a press release were written poorly, contained explicit or vulgar language, and was the opposite of what the targeted publication typically published (this would be a negative relationship). For an experimental relationship to exist, the independent variable must cause change in the dependent variable, and there should be no other sources or extraneous variables that might have caused that change. The experiment helps to verify that cause–effect relationship by establishing that changes in the independent variable cause changes in the dependent variable, that the effect follows the cause, and that no third variable (or other unhypothesized variables) caused the change. To establish this, the researcher must establish control over the experiment.

Control, as previously noted, means that all possible sources of error—or invalidity, as Campbell and Stanley label it—have been accounted for. In an experiment, what is unknown is what the research worries about. There are seven sources of error or invalidity that the researcher attempts to control: *history* (what occurs before and during the experiment), *instrumentation* (impact of the measures used), *maturation* (how time impacts on the experiment), *mortality* (knowing who dropped out of the experiment), *regression* (potential problems associated with choosing people due to extreme scoring), *selection* (biased sampling of participants), and *testing* (impact of being tested on later tests). If the experiment is designed in such a way as to nullify each of the seven sources of invalidity or error, then the results can state, within some margin of safety, that one variable caused a change in another.

No other research method can establish causation; indeed, that is the primary reason for conducting an experiment. Surveys, focus groups, interviews, participant observations—all lack the formal control necessary to state that changes in one variable caused a change in another.

Experimental and Quasi-Experimental Designs

In 1963, Campbell and Stanley published *Experimental and Quasi-Experimental Designs for Research*, a seminal work that established what

has become the standard set of experimental designs. They placed these designs into three classes: preexperimental, true experimental, and quasi-experimental. The preexperimental designs do not randomize participants to different independent variable manipulations (the “experimental conditions”) and do not provide a control group that receives no manipulation to test against for spurious relationships. The true experimental designs randomly assign participants to experimental conditions and provide a control group or groups against which to test the impact of the manipulations. Finally, the quasi-experimental designs vary between randomization and control group assignments and include what some call “time-series” designs in which the participants are observed over a number of times. Of the three designs, the true experiment is the only method that allows researchers to state that a change in one variable *causes* a change in another variable with great certainty.

The true experiment would take a group of people and randomly select them to either the experimental (manipulated) or the control (no manipulation) conditions. The classic true experimental design looks like this:

R represents random assignment to the groups O, which represent pretest and posttest measures, X represents that the people in group O₁ were exposed to the independent variable after an individual measure and then measured again at O₂, and participants in the control group (no X or manipulation) were measured at the same time as the experimental group. If O₂ is different from O₁, then we know that X caused the change, but could something else have had an impact—that “third” variable? A comparison between O₁ and O₃ and O₄ would let us know if history, maturation, instrumentation, regression, mortality, or testing could have affected the results. Selection is controlled for by random assignment to either experimental or control conditions.

The experiment is one of the most elegant research methods available to the public relations researcher. It is not often found in the public relations literature at the academic level and because

of time constraints is rarely used in day-to-day practice; however, the advent of the computer has provided some experimental simulation to test potential theories.

EXTENDED PARALLEL PROCESS MODEL OF RISK COMMUNICATION

Kim Witte’s extended parallel process model (EPPM) of risk communication focuses on the effectiveness of fear appeals in persuasive communication efforts by suggesting that communicators must provide receivers with efficacy or the feeling they are able to achieve the desired results. Otherwise the fear aroused by the situation can lead to denial or avoidance instead of more constructive responses to lower or avoid the risk. The health risk message model posits that messages should instill a sense of threat that will motivate but not overwhelm the receiver’s perception of efficacy. Overwhelming one’s sense of efficacy could force receivers to shut out messages as they focus on addressing their emotions as opposed to the desired behavior modification or change.

Fear appeal messages, the basis for EPPM, are created with the intent of arousing fear by promising negative consequences for a specific behavior. For years, scholars have debated the use of fear appeals, primarily in risk and health care campaigns, with most of their discussions focusing on the effects of varying intensities of fear appeals and how they affect audience response to the messages that accompany them.

Pioneering fear appeal studies focused on the motivational aspects of fear appeals. For example, in 1953, Carl Hovland, Irving Janis, and Harold Kelley proposed that fear is a learned drive and that protective recommendations will be accepted if they reduce the fear. Researchers determined that emotional tension must be apparent in an individual before fear appeals will successfully persuade. On the other hand, it was suggested that strong fear appeals might create defensive avoidance reactions, meaning individuals need to rid themselves of the fear that certain messages leave behind. This means that, in an attempt to dispel fear, a receiver would either adopt the suggested behavior or reject the message all together.

As a result, researchers concluded that too much fear would result in one actually avoiding and resisting the message. However, in 1971, Howard Leventhal suggested that message rejection could be avoided since the “protective adaptive behavior” stems from the receiver trying to control danger or threat and is not an attempt to control fear. Attitude, intention, and behavior changes are “danger control” processes, and denial is simply a form of “fear control.” As a result, researchers claimed that fear may be reduced to denial unless the suggested action is completely effective in eliminating the danger.

Building on these ideas, Leventhal’s drive paradigm suggested that while variables, such as portions of fear appeal messages, may turn fear off and on, they do not have important effects on the actual persuasion. As a result, the parallel response paradigm was proposed and focused on the cognitive processes associated with fear appeals. It argued that emotional responses such as fear, and adaptive responses like belief and behavior change, are arranged in a parallel relationship, therefore concluding that a stimulus is a source of information that is interpreted and then leads to a response.

In addition to looking at the suggested action in a fear appeal message, theorists reasoned that a fear appeal must be constructed in a way that makes it difficult for the receivers to see themselves as invulnerable to the threat. To advance this idea, researchers focused on the reassurance variable. Fear appeal messages were found to be more effective when the message recipients felt that they were at risk of experiencing the negative consequences portrayed in the message. This meant that people’s attitude and behavior changes are motivated by the reassurance variable as opposed to fear.

Building on Leventhal’s danger control and fear control research, EPPM suggests that fear is associated with fear control responses and is not directly related to danger control responses. This differs from past studies as it addresses both the cognitive and emotional factors associated with processing fear appeal messages. These processes are then tied to the success or failure of the fear appeal. Past studies usually focused on danger control processes and had, for the most part, ignored fear control processes and persuasive failure.

According to EPPM, there are two appraisals of a fear appeal message. First, the threat of the hazard is appraised. Having two parts, threat is composed of both severity and susceptibility. Severity is related to how bad or serious the audience perceives the threat’s outcome will be, while susceptibility refers to whether or not receivers think they will be affected. The greater the perceived threat, or perceived severity and susceptibility, the more motivation an individual has to begin the second appraisal or the evaluation of the efficacy. Efficacy also has two components: response and self. Response efficacy is how effective the suggested action is perceived to be, while self-efficacy affects audiences’ perceived ability to perform the actions. For a message to be effective, both response and self-efficacy should be established with an audience. The relationship between threat and efficacy is multiplicative. For example, high threat–high efficacy conditions have been found to foster positive changes in attitudes, intentions, and behaviors (danger control processes and outcomes), whereas high threat–low efficacy conditions initiate defensive avoidance or reactance (fear control processes and outcomes).

According to EPPM, an individual’s perceived threat determines the degree of reaction to fear

appeals, while perceived efficacy determines the nature of the reaction. This means fear appeals and risk messages that leave the receiver with a clear understanding of the negative behavior's consequences, a feeling of vulnerability, and a reasonable suggested action to avoid the presented threat are good first steps in creating the desire for attitude and behavior change.

EXTERNAL ORGANIZATIONAL RHETORIC

Rhetoric offers practical advice as to how to establish credibility, how to construct logical arguments, and how to emotionally connect with an audience. Rhetoric also presents an epistemology that steers away from naïve realism to show how knowledge is generated and socially constructed through communication. This allows the public relations practitioner to understand the complexities at hand when building relationships with an organization's stakeholders, whereas the critical scholar can use rhetoric to understand how organizations attempt to achieve specific political or economic goals. In the words of Robert L. Heath, while scholars of internal organizational rhetoric want to improve the workplace, scholars of

external organizational rhetoric often seek to make society a good place to live. This entry gives a brief overview of the contributions public relations scholars have made to the study of external organizational rhetoric and also points out some of the challenges that remain.

Contributions

Rhetoric helps organizations focus on the different interpretations and zones of meaning that stakeholders have and assists in codifying and cocreating meaning. Rhetoric is simply the essence of an organization's relationship with its stakeholders and something that strengthens public opinion processes by orchestrating a clash of viewpoints. It has thus been argued that external organizational rhetoric is a legitimate activity and positive force. Rhetoric can also be used in manipulative ways, however, something rhetorical criticism attempts to address. Michael J. Palenchar and K. R. Fitzpatrick, for instance, point out that front groups violate the ethical and rhetorical tradition with regards to listening and striving for shared meaning.

External organizational rhetoric has been analyzed using the ancient work of Aristotle, Isocrates, Cicero, and Quintilian, as well as more modern rhetoricians such as Kenneth Burke, Chaim Perelman, Stephen Toulmin, and Lloyd Bitzer. Many published studies have an intrinsic character, but there is also a slate of publications that focus on rhetorical concepts such as enthymematic argumentation, ethos, paradoxes, apologia, stasis, metaphors, model and antimodel arguments, ideographs, as well as the notion of rhetorical situations and outlaw discourse.

One example of ethos analysis was pointed out by Øyvind Ihlen (2009), who analyzed corporate strategies applied to create the impression of corporations as credible environmental actors. Corporations proffer, for example, that they have cleaned up their own house by expanding recycling operations or moving to curb emissions. This rhetoric has been criticized for not engaging with fundamental problems such as the use of fossil fuels.

The best-developed line of research on external organizational rhetoric continues to be that which deals with crisis communication, including the notions of self-defense, or apologia, and dissociation

like those explored by Keith M. Hearit. Typical strategies include separations between opinion and knowledge, individual and group, and act and essence, all of which signify attempts to absolve the organization from guilt. When an organization actually does apologize for an act of wrongdoing, Hearit stated in 2006, it humiliates itself in a form of “secular remediation ritual” (p. 205). This eventually functions as a memorial that can restore faith in the social hierarchy by praising the social values that have been broken.

Challenges

George Cheney and Lars Thøger Christensen have criticized the ontological assumption concerning the positive view of a marketplace of ideas where the material has no place. It becomes questionable as to whether the ethics of external organizational rhetoric can be grounded in this idea as long as there is no guarantee that all arguments will be heard, or that better arguments will prevail over self-interested arguments.

The issue of materiality—concerning resources and technology, for instance—and how this affects dialogic ideals is also echoed in a special issue of *Management Communication Quarterly* (2011, 25[3]). The contributors point to challenges current scholarship into external organizational rhetoric faces relating to the discrepancy between theoretical ideals and rhetoric in practice. Public relations is most experienced at helping organizations achieve their own interests—at the expense of others, if necessary. A basic problem relates to the self-interest of organizations, particularly profit-driven corporations. Should self-interest be embraced and corporations be encouraged to openly communicate this motive—or is society better off with a rhetoric spurred by the tensions that exist between the ideal and real? It could be argued that recognition of economic rationality does not necessarily have to be celebrated, due to the tendency to externalize costs at the expense of others. Ideals can still be posed and encouraged.

Technology—and social media, more specifically—also plays a role in providing opportunities, as well as in imposing constraints on external organizational rhetoric in its intended application, the addressing of stakeholder concerns. One possibility is that social media encourages more dialogic

rhetoric, but little research has been conducted on this topic.

EXTERNAL PUBLICATIONS

External publications are internally produced media used to connect a company or organization to its publics. Once limited to print-only publications, organizations now can use the digital environment

to publish news of interest to external publics. Newsletters and magazines, both in print and digital form, are distributed to different external constituents to inform them of relevant news, innovations, and activities within the organization. Blogs, websites, e-newsletters, and other digital publications offer a low-cost, efficient way to update information more frequently and, with mobile technology's significant reach, many organizations are moving away from expensive print publications to affordable digital communications.

External publications vary in size, purpose, and audience depending on the organization that produces them and the objectives for the publications. External publications are seen as more credible and consistent than advertising and contain articles and information written in a professional manner. Some organizations, however, do use external publications to complement advertising or marketing goals. There are many types of external publications that organizations use to keep in contact with relevant audiences. A large entity may produce several external publications for customers and potential customers, distributors and salespeople, and shareholders and investors. The budget allotted for an external print publication dictates the publication form, from a simple newsletter to a glossy, four-color magazine. Glossy magazines translate well to mobile tablets.

The customer publication is targeted at current and potential customers of a business and serves to entertain, inform, and maintain consistent contact. External publications are more thoroughly read than ads, and while advertising budgets can fluctuate, a monthly or annual newsletter can provide customers with continuity. A quality external publication can create loyalty, reinforce the company's name, objectives, products and services, and can let customers become more acquainted with the business via profiles of employees or letters from high-ranking management. Success stories from satisfied customers, or information about promotions, achievements, and innovations, can create and maintain interest from the customer base. An external publication is also a good way to exhibit a company's activities separate from normal business, such as corporate social responsibility programs.

The sales publication is a useful tool for keeping distributors and salespeople connected and

informed about new procedures, policies, technology, and competitors. An external publication to distributors can build morale while reminding distributors of the company's business objectives. By spotlighting different distributors, they can encourage and reward salespeople, keeping them motivated to contribute to marketing goals. Solving hypothetical sales problems, demonstrating sales techniques, and including tip sheets can improve business and maintain a confident, trained sales force. By keeping distributors and salespeople up-to-date about competitors' actions, salespeople will be better prepared to field questions from customers about competitors' products and services.

The audiences most concerned with the activities of a public company are the investors and shareholders, and a publication targeting them can fortify the relationship between a company and those with a direct stake in it. Budgets are generally higher for these publications, which are usually printed as a magazine, with longer articles and more detailed descriptions of company changes, policies, and developments. It is common for these publications to have biographies of executives, and they may often contain quarterly or annual financial documents. One such publication is the annual report. It is crucial for a company to maintain a healthy relationship with its shareholders and investors, and producing a well-written publication can create a favorable image. Increasingly, companies are moving away from expensive printed annual reports, opting for digital distribution.

Once it is determined that a company wishes to produce an external publication, there are several options, depending on its size and budget. A small company may choose to produce the publication in house by using desktop publishing software. It might get its target audience from current customers or may be willing to purchase a distribution list. A larger company might have an in-house employee with journalistic experience to work exclusively on all its external publications. Hiring a public relations or advertising firm will incur greater costs but is likely to ensure a quality publication.

An external publication should reflect the values and image of the organization it represents. The longevity of the publication is key in determining the types of articles and information it contains.

If it is published on a weekly or monthly basis, the articles can be more specific, timely, and detailed. If it is an annual or biannual publication, the articles are usually more generic and used as an overview of an organization and its activities. Either way, the publication should have a design or format that incorporates the image and mission of the company (Altshul, 1986).

In-flight magazines are some of the most widely read external publications. Delta's *Sky Magazine* and Southwest Airlines' *Spirit Magazine* contain articles about business, sports, entertainment, and leisure travel destinations that the airlines service.

Not all successful external publications have to come from large organizations. A local hospital could publish a newsletter about health and fitness, or a university could keep interest in its activities with an alumni magazine.

External publications can be as varied in size and scope as the organizations that produce them. But a well-written, informative, and entertaining external publication can be more credible and

more thoroughly read than advertising and can give a company direct exposure to a key public.

F

FACT SHEET

A fact sheet is what its name implies: a compilation of facts about a certain topic. Fact sheets are typically used as supplements to news releases, to fill information requests, or as one of several pieces in a press kit. Many organizations keep them on file for standard topics (corporate history, general business facts) so that they can respond quickly to requests for information.

Fact sheets should be written with clarity and for ease of use. First, each one should be focused on one topic. The topic can be as broad as general facts about a company or as limited as facts about a specific community service program. Limiting the topic to a single subject allows for focus in the writing and precision in responding to information requests.

Next, the fact sheet should be written in as direct a manner as possible. Many fact sheets are produced as bulleted lists, with subheads to direct the reader to specific areas of interest. Such a format enables users to quickly find specific points they are looking for. This format is particularly appropriate for media users, who turn to fact sheets for additional information beyond a news release when writing a story. Full sentence style is also used, since not all material lends itself to bullet points, and some material can be presented more clearly in full sentences. As with a news release, journalistic writing style should be followed, although headings are often used. A third

possibility is a combination of the two styles: a heading, followed by a brief explanatory paragraph, followed by bullet points. Whatever writing style is chosen, the determining factor should be how to most clearly present the information for easy use.

Finally, the format of a fact sheet should mirror that of a news release. Appropriate contact information is a must, since the piece may not always be used to supplement a news release or as part of a press kit. Even in those uses, it could become separated from the other materials. The date of the most recent update of the information should also be included. This date assures the reader that the information is current and gives the public relations practitioner a quick reference point for knowing when information should be reviewed.

Increasingly, organizations are making fact sheets available on their websites. For example, General Electric has fact sheets on topics such as company history and company values accessible through the News Room on its home page (www.ge.com). Useful graphics and pictures are easily included through this medium. As both the media and members of the public come to rely more on the Web as a source of information, making company information available in this manner will become more of an expectation than an option.

FAQs

Prepared by public relations practitioners and included in media kits and on websites, Frequently Asked Questions (FAQs) and their corresponding answers help explain new or technical products, services, mergers, and special events or issues to journalists and other target audiences. Prepared in a question-and-answer format, FAQs are a variation of the traditional fact sheet, and they often accompany news releases, photographs, and related materials to provide additional information that journalists may need to produce stories or that other audiences may need to better understand some product, stance, organization, service, or issue. FAQs can also supplement fact sheets or technical specification sheets.

In the early days of the World Wide Web, a simple FAQ page was placed online to answer questions about companies, products, and services, but today's Web-based FAQs often incorporate embedded links to guide audiences to more specific information about a particular question and answer or to graphics, animation, charts, or video or audio files. Although standby statements and media advisories also incorporate a question-and-answer format, FAQs serve different purposes than those communication tools.

When developing FAQs, public relations practitioners should place themselves in the minds of the target audiences to identify the questions a typical journalist, consumer, employee, or other stakeholder would pose. If possible, questions can be further identified and honed by using focus groups; inquiring informally with members of the target audience; pretesting the information by distributing it and following up with the target audience to see how well the information was understood or if there are additional questions or areas of confusion; and drawing upon previous audience queries for related products, services, or stances to identify likely questions or areas of confusion and to develop the corresponding answers.

FEATURE

A feature story, also referred to simply as a feature, differs from a news article in tone and organizational structure. Whereas news articles are written in objective journalistic style, feature stories employ a more creative style intended to capture the interest of readers through the use of details and descriptions.

News articles are written in inverted pyramid style, with most important information first (who, what, when, where); in contrast, feature stories are written with an interest-catching beginning, a body or middle that provides background or context, and an end that makes a final point or gives perspective to the topic. In features, sometimes the most important information is saved until the end. Features are usually longer than news articles, and they are not written to “cut from the bottom” to fit the available space. Whereas news articles offer the bare facts, presented briefly, features offer more detail.

Advantages of features for public relations practitioners include their “shelf life.” Features may be written far in advance of publication and used when the topic becomes particularly timely. Feature writing can capture emotions and imaginations more effectively than can news writing. On the minus side, feature writing can be more time-consuming and creatively challenging, and sometimes finding the mass media market for features is difficult. For organizational publications, feature stories are an important communication tool.

Public relations practitioners can write features about people, organizations, programs, or services within organizations, products, and issues. Organizational leaders, employees, and volunteers offer obvious subjects for feature stories. Organizational anniversaries provide a focus for feature-length organizational histories. How-to articles are another feature approach. Topics of current public interest may provide another angle for the public relations writer to address.

FEDERAL TRADE COMMISSION

The Federal Trade Commission (FTC) is a five-person, independent government agency that has as its primary goal the protection of consumers from unfair or deceptive business practices. The FTC originally was created in 1914 to prohibit unfair competition, but Congress later expanded the commission's powers to include regulation of false and deceptive advertising. The commission's basic authority stems from Section 5 of the Federal Trade Commission Act (FTC Act), which states that "unfair or deceptive acts or practices in or affecting commerce are hereby declared unlawful" (5 U.S.C. §45 [a] [1]).

Historically, the FTC was known for timidity and delay; with the consumer movement of the 1960s and 1970s, however, Congress enlarged both the agency's budget and its powers. As a result, the FTC aggressively went after some of the nation's most prominent advertisers and by the late 1970s was viewed by many as the most powerful U.S. regulatory agency. In the 1980s, however, the FTC's influence declined after the Reagan administration significantly reduced the agency's funding. The FTC again increased its enforcement efforts in the 1990s, targeting the tobacco industry for the "Joe Camel" campaign and other advertising designed to appeal to children, as well as a number of national advertisers for false advertising in the form of program-length infomercials. Since 1996, the agency has cracked down on Internet fraud and emphasized through enforcement actions, working papers, and law enforcement initiatives that the FTC's consumer protection mandate extends to Internet, as well as traditional retailers.

Through its Bureau of Consumer Protection, the FTC works to shield consumers against false, unfair, misleading, or deceptive advertising. The FTC defines advertising broadly, exercising jurisdiction over much more than just standard, paid-for product publicity advertisements. Public relations practitioners must be aware that the FTC considers all activities or communications meant to draw public attention to a product, service, person, or organization for purposes of trade as *advertisements* and therefore subject to regulation. This definition therefore includes press and video releases, sales brochures, direct mail, product labels, and promotional contests, as well as standard media advertisements.

Since 1983, the FTC has defined deceptive advertising as "a material representation, omission, or practice that is likely to mislead a consumer acting reasonably under the circumstances." Three elements should be noted about this definition. First, a literally true statement may qualify as deceptive if by omitting a fact it thereby creates a misleading implication. Second, an advertisement will be considered deceptive if it is likely to mislead a reasonable consumer with the characteristics of the target market, even if the ad does not in fact deceive anyone. Finally, even an advertisement that is likely to mislead the public is nevertheless not deceptive unless the misleading claim qualifies as "material." According to the FTC, material claims are those that are likely to affect a consumer's decision to purchase a product or service. Ambiguities contained in advertisements are generally interpreted against the advertiser. Whereas false statements contained in advertisements are almost always deceptive, opinion statements that are incapable of being proved true or false and that reasonable consumers would not believe to be true fall into the realm of "puffery" and are acceptable.

Since the 1970s, the FTC has also required that advertisers provide reasonable evidence to back up verifiable product claims before those claims appear in an advertisement. Claims made without this required substantiation are considered deceptive, even if later they prove to be true. If an advertiser states that test results prove something about a product, the test must have actually been conducted in a scientifically accurate manner and the results must not be presented deceptively. Furthermore, FTC guidelines require that people, including

celebrities, who make endorsements implying that they use the endorsed products must actually use those items they endorse.

In 2009, the FTC revised its endorsements and testimonials guidelines to apply to product promotions made over the Internet, including via blogs and social media such as Facebook or Twitter. Under those guidelines, online product reviewers must disclose any material connection they have to the seller, including payment or exchange of in-kind services those reviewers receive in return for their reviews. In 2010, a public relations firm hired by a video game developer settled FTC charges that the firm had its interns pose as ordinary consumers to post laudatory game reviews on an online vendor's website.

An FTC investigation of an advertiser's methods can result from either consumer complaints or the commission's own initiative. Most often, investigations begun by the FTC end by the issuance of a consent order, whereby the advertiser agrees to stop running the objectionable advertisement but does not admit to any violation of the law. The FTC can also bring a formal administrative complaint against the advertiser, which requires a hearing before an administrative law judge. The judge's ruling in the case can be appealed to the full commission and eventually to the U.S. Circuit Courts of Appeal. If an advertising claim is ruled to be deceptive, the FTC has three possible remedies: (1) It can issue a cease and desist order, which forbids the advertiser from making further deceptive claims; (2) it can issue an affirmative disclosure order, which requires the advertiser to provide consumers with additional information to ensure that future advertisements are not deceptive; or (3) it can order the advertiser to run corrective advertising that specifically corrects past false claims.

The FTC also has the power to issue Trade Regulation Rules that define and prohibit illegal advertising practices on an industry-wide basis.

FEMINIZATION THEORY

The feminization of public relations began in the 1980s when women became the majority of public relations practitioners. Corporations attracted women into public relations departments to satisfy government requirements of affirmative action to hire women and minorities. Recent figures from several studies suggest that women comprise 73% to 85% of the public relations workforce.

Despite advances, women are not wholly represented in the top ranks of public relations at those percentages. Several U.S. and international studies from the Public Relations Society of America (PRSA), the International Association of Business Communicators (IABC), and the U.S. Census demonstrate gender disparities because women represent slightly more than half of all managers. A number of factors contribute to why the number of women moving from specialist work to managerial work drops. Factors such as family obligations, stereotyping of feminine characteristics, and stigmas against technical work contribute to women's lowered representation in managerial ranks.

Feminization theory in public relations explains and predicts the relationship between gender and workplace outcomes. Individual women experience negative outcomes because of feminization, such as pay gap, slower advancement, and less professional development opportunities compared to men. The industry experiences negative outcomes because of feminization. Specifically, the reputation of public relations is devalued as a "soft" field rather than a savvy, evidence-driven

practice, and public relations personnel fight a long-term battle getting a position within executive management.

The “Velvet Ghetto” and the “Feminine Fallacy”

The term *Velvet Ghetto* originated in a *Business Week* article in 1978, “PR: ‘The velvet ghetto’ of affirmative action.” The article accurately predicted that in 20 years, more than half of the public relations workforce would be women because these positions were available, nonthreatening, and noncompetitive for managerial positions. In response, the IABC Foundation commissioned a series of Velvet Ghetto investigations to determine the effects of the increasing number of women in the field. As lead investigator, Elizabeth L. Toth summarized the findings of the research in 1988: Women are more likely to see themselves as technicians than managers; women receive lower salaries than men; and all professions that shift from male to female dominance undergo a decrease in status and salary. This problem is known as the “feminine fallacy.” Public relations appears to be an open field to women, but women consistently experience gender-based discrimination in myriad ways.

Glass Ceiling Studies

Throughout the 1990s, the PRSA Foundation commissioned a team of researchers to explore practitioner salaries as well as their perceptions of job satisfaction, sexual harassment, and roles. Through a series of “Glass Ceiling” studies spanning nearly a decade, researchers concluded that women practitioners experience a glass ceiling in public relations. Women try to “do it all” by performing managerial activities *and* technical tasks for lower pay than men.

Liberal and Radical Feminist Strategies

In 2001, Larissa A. Grunig, Toth, and Linda Childers Hon compiled a comprehensive literature review on this issue in *Women in Public Relations: How Gender Influences Practice*. The essence of this review led to liberal feminist strategies that women should employ to change themselves—including learning to negotiate more, monitoring

their behavior, seeking out mentors, returning to school for advanced degrees, getting accredited, and attending after-hours functions to “get ahead.”

Conversely, radical strategies promote that organizational and social structures should be changed to enable women to balance career and family. Most importantly, organizations should pay women and men equally according to experience, education, and merit. Organizations should also adopt family-friendly policies; enact more objective hiring practices; and target women for advancement opportunities by providing mentorship, role models, and professional development. Large-scale policies should make unequal pay practices illegal and allow both women and men more family leave time and benefits.

Recent Trends in Feminization Research

Since the first edition of *Encyclopedia of Public Relations*, scholars and associations have forged new directions of research and practice to counter negative effects of the feminization of the field. Recent trends in research include topics of life-work balance, structural and discursive power, and diversity and identity.

Life-Work Balance

Most recent research extending feminization theory has honed in on life-work balance conflicts and strategies. In 2007, David Dozier, Bey-Ling Sha, and Masako Okura found that women pay a toll when they disrupt their careers to have children. Barriers women face include difficulty getting back into the field, returning to lower status positions or organizations, and limited opportunities for career advancement as a result of increased family responsibilities. Research by Linda Aldoory, Hua Jiang, Toth, and Sha also highlights the persistence of the stereotype that life-work balance is a “woman’s issue.” Practitioners perceived that public relations is not an industry that enables good work-life balance, and they employ some unfavorable personal strategies like sleeping less and leaving desirable jobs that don’t allow for balance.

Despite the consistent findings of inequality, this body of work gives voice to practitioners as they experience marginalization through institutional

and societal restrictions. In 2011, Natalie T. J. Tindall, Sha, and Dozier suggested organizational reforms like employing flexible work practices and individual efforts like focusing on work–life effectiveness and career path flexibility. Furthermore, PRSA now also sponsors a National Committee on Work, Life, and Gender to suggest evidence-based reforms for reducing life–work conflicts.

Structural and Discursive Power

Power as conceptualized in the words, messages, and structures of public relations has recently been interrogated by scholars like Aldoory, Bryan Reber, Bruce Berger, and Toth (2008). For example, scholars and associations are reconsidering fundamental histories and theories of public relations. Only until recently have women leaders in public relations in history been highlighted. Second, as evidence of their absence, James E. Grunig's traditional four models of public relations are based on men's approaches to communication (P. T. Barnum, Ivy Lee, Edward Bernays). As women are largely absent in public relations' history, Brigitta Brunner found in a 2006 study that women are also underrepresented as writers of and players in public relations textbooks. Such arguments work to expand Pam Creedon's (1991) suggestion that roles theory is gendered and scholars need to "re-vision the value of work in public relations" and "deconstruct the 'trash compactor' model we have used to condense a multiplicity of experiences into two hierarchical roles" (p. 80).

Diversity and Identity

Since the *Encyclopedia of Public Relations*, first edition, feminist scholars have introduced new approaches to studying gender disparities and have examined how gender relates to other marginalizations according to race and national culture. For example, in 2007, Sha and Rochelle Ford interrogated the extent to which requisite variety can be considered as a possible response to racial inequality among practitioners. Scholars like Donnaly Pompper (2007) and Tindall (2009) have also linked gender and racioethnic identities as they co-exist and reproduce one another to produce a "double jeopardy" effect for some. Finally, non-U.S. researchers are finding evidence of feminization and

new empowerment strategies in Germany, Indonesia, Taiwan, Ghana, and Russia, among others.

Overall, feminization theory has illuminated the complexity of women's experiences in public relations. It demonstrates that women's work continues to be undervalued, which has industry-wide consequences. Although researchers and associations alike promote a range of empowerment strategies, the future of women's status in the field will largely depend on organizational and policy initiatives toward increased diversity and equality.

FIELD THEORY

Field theory is an approach to analyzing social relations that was developed by French sociologist Pierre Bourdieu (1930–2002). He conceived of fields as hierarchical social structures in which people try to either preserve or acquire dominance. Fields determine the way people perceive and relate to one another in areas such as politics, business, art, science, philosophy, journalism, and entertainment. Across these areas, fields often overlap with and nest within one another. Within any given field, people's relations and conflicts play out according to specific rules, rewards, and sanctions that are recognized as legitimate by the field's members. Field theory is useful for studying public relations because it can specify how the profession's characteristic activities affect the balance of power throughout society.

Examples of fields include the overall “field of power” in a society, the economic field of capitalist competition, fields of politics at different levels, and various types of what Bourdieu called “fields of cultural production,” for example, academia, the art world, the literary world, popular and classical music, journalism, and other parts of the entertainment professions and communications media.

Fields have a hierarchical structure because their members perceive one another to occupy

relatively high or low positions depending on how much of the limited resource of power or “capital” they possess. Capital comes in various forms, and Bourdieu's work usually focuses on three: economic capital, which tends to dominate in the general field of power in capitalist societies; cultural capital, which artists, writers, scholars, and scientists tend to value, and which is under constant threat of being corrupted by economic capital; and a broader type of symbolic capital, which comes in forms such as honor, status, legitimacy, and gender domination. Less frequently, Bourdieu's work also analyzes the workings of social capital, academic capital, and political capital.

Field theory provides a method for studying the interconnections of different parts of society in which different forms of capital are valued. Bourdieu differentiates between fields that are relatively autonomous and those that are relatively heteronomous. A field tends toward autonomy when its members value one well-defined form of capital, such as the economic profit that corporations value or the expressive skills that artists and entertainers value. A field tends toward heteronomy when its members value different types of capital in differing ways. For example, the political field in a democracy becomes heteronomous when its members begin to view fundraising (economic capital) as more important than the ability to unite and mobilize different groups (social capital) or to gain publics' respect (symbolic capital); the field of professional journalism becomes heteronomous when news organizations value profits and advertising revenue (economic capital) more than they value reporting skills (cultural capital) and professional ideals of public service (symbolic capital).

These concepts of fields and capital have been found relevant to public relations in several contexts. One is the context of how practitioners can help organizations attain dominance within their relevant arenas of competition by acquiring relevant forms of capital. In every field, some people, groups, or institutions will have relatively high amounts of capital (the “dominant”), and others will have relatively low amounts (the “dominated”).

Even though dominant field members often strive for monopolistic control, fields tend to be internally dynamic because their members continue to engage in competitive struggle. This internal dynamism is driven by people's efforts to either

conserve or subvert the field's valued form of capital. Members of a field who possess more of this capital tend to follow "conservation strategies," such as preventing new participants from entering the field, endorsing prevailing worldviews and values, and maintaining the status quo of dominant and dominated. By contrast, members of a field who are relatively less endowed with its valued form of capital are more inclined toward "subversion strategies," for example siding with underdogs and outsiders, challenging and disrupting the status quo, and questioning established worldviews and values.

In sum, Bourdieu's notion of field struggles consists of the following component parts: (a) human agents, who possess (b) dispositions (which he calls *habitus*, singular and plural) that determine their behavior and who occupy (c) positions within a field and rely on (d) strategies of conservation or subversion in order to acquire or transform (e) capital that will enable them to occupy (f) a preserved or changed position in the field.

Field theory raises several questions that are relevant to the social impact and significance of public relations. What types of capital do different types of public relations tactics and strategies help practitioners and clients secure and accumulate? Can public relations transform a field by affecting the types of capital its members value? If so, how?

To answer such questions, field theory has been recommended as a way to make practitioners more sensitive to the different ways power works in different parts of society. If practitioners know which forms of capital their target publics value, they are likely to make well-informed choices about how to influence or manage relationships with them. For example, to win over public opinion in certain fields, sometimes what is necessary is the cultural capital of being able to make a convincing argument; at other times, it is the symbolic capital of being perceived as a charismatic, empathetic, or trustworthy person or organization; and at other times, it is the economic capital of funds that can buy media space and set the public agenda through advertising or other forms of publicity.

Field theory offers an alternative perspective on public relations ethics. Rather than evaluating practices according to moral-philosophical standards of rightness, a field analysis could more neutrally point out how certain practices either conserve or

subvert certain types of capital, and whether those practices benefit dominant or dominated members of a field.

FLACK

Flack is a derogatory term for a publicist or press agent in the entertainment industry. This slang term, primarily used in the United States, has had its use extended with the passage of time to include all public relations practitioners and activities. The origin of the term is unknown, but many attribute the coining of the term to *Variety* magazine, which some sources say began using the term as a tribute to motion picture industry publicist Gene Flack in acknowledgment of his skills in promoting movies in the 1940s.

Wes Pederson, director of communications and public relations, Public Affairs Council, in a letter to the Public Relations Society of America's *The Strategist*, attributed the first explanation of the term in common usage to Peter Martin in a *Saturday Evening Post* article in the April 1, 1950, issue. Martin's lead in that article, titled "Hollywood Says: 'Please Stay Away!'" reads, "My friend, the movie-studio flack, came back from hoofing it around the jungle of soundstages and buildings, all

fronts and no backs, that was his beat.” In the very next sentence, Martin explains that “flack is Hollywood slang for publicity worker or press agent.”

However, the *Oxford English Dictionary* lists the first reference to the use of *flack* as slang to Stewart Sterling. In his 1946 Fire Marshal Pedley detective story, *Where There's Smoke*, one of the characters announces, “That publicity flack is here.”

The first reference book to include the term, according to the *Oxford English Dictionary*, was Al Berkman's 1961 *Singers' Glossary of Show Business Jargon*. The term was defined in that reference source as “a member of the Publicity Department (usually of a motion picture studio); press agent.”

The *Morris Dictionary of Word and Phrase Origins*, published in 1962, notes that

flack is a slang term common in the theatrical and popular-music fields, meaning “press agent.” We have been familiar with it in this sense for years and suspect it antedates the World War II meaning of “flak” . . . ; that of antiaircraft fire.

The *Morris Dictionary* goes on to observe that “it has never enjoyed the wide popular acceptance given, for example, the term ‘disc jockey,’ which became current in entertainment circles at about the same time.”

Almost every reference to flack includes another reference to flak, a 1938 term for an antiaircraft gun, borrowed from the German *flak*, an acronym formed from *Fl(ieger)a(bwehr)k(anone)*, literally airplane defense cannon. One surmises that if, in fact, there is an association between these two terms, it is meant to imply that a Hollywood press agent or publicist is a cannon of empty rhetoric.

More likely is the association with one of the now obsolete definitions at the root of the word flack. According to the *Oxford English Dictionary*, the word derives from the Middle English formation of the Middle Dutch *vlacken* and the Icelandic *flaka* meaning “to flap.” The transitive form of the word meant “to move or shake intermittently.” In agricultural usage, flack meant “to beat with a flail.”

Taken together, it seems more probable that the original slang had more to do with someone being a “mover or shaker” or actively pushing a story or client with such vigor that journalists felt they were being “beaten with a flail,” than anything to do with an air defense cannon or the type of shell it fires.

However, many an Allied bomber pilot in World War II reported that the German flak was “thick enough to walk on” and interfered with their mission, so one could make a case that the slang derives from the intensity of the publicist's effort or the journalists' impression that the never-ending stream of press releases “interferes” with their self-appointed mission to inform the public.

Fortunately, the term *flack* seems to have entered a period of remission in most mainstream publications. Dennis L. Wilcox and Glen T. Cameron (2003) noted that “in recent years most publications, including *The Wall Street Journal*, have refrained from using the ‘F’ word in print.” However, they also point out that “trade publications such as *Editor & Publisher* still use it on a regular basis” (p. 11).

Although the term has found its way overseas, as many slang terms often do, it is not as prevalent there as it was in America in the 1950s and 1960s. One hopes that the increasing professionalism of public relations will reduce the perceived need on the part of journalists and others throughout the world to apply such a derogatory term to the practice of relationship building.

FLAME

For more than a decade, *flame* has been used to describe hostile or insulting online messages, and it

has become an accepted word. Flaming has important image management implications for individuals and organizations.

“Sending abusive messages to one with whom one disagrees” is considered “an aggressive use of email, bulletin boards, or chat rooms” (Lister, Dovey, Giddings, Grant, & Kelly, 2003, p. 386) and often involves personal attacks. *The New Hacker’s Dictionary* includes related terms: *flamage* (content), *flame bait* (message designed to solicit flames or provoke flame war), *flame on* (to begin or continue flaming), *flame war* (caustic altercation), and *flamer* (flame prone). Flaming also has been used to refer to speaking overzealously or unceasingly. Recent use dates back to 1969, and flame may have arisen from Chaucer’s work. Flame on is a pun based on the Human Torch from Marvel Comics.

Flaming is the most famous and publicized online misconduct. Further, it is one of the most enduring problems for users of computer communication. Flaming is a breach of *netiquette*, Internet etiquette (accepted conventions for behavior online). Larry Scheuermann and Gary Taylor compiled netiquette suggestions: “don’t flame,” use the Golden Rule, respond as if in person, recognize that flames detract from topics, and avoid taking offense. Other recommendations include avoiding quick responses to hostile messages, considering alternative interpretations and responses, stressing areas of agreement, softening language used to disagree, and recognizing tone and word choice. Many responses, especially if from a “rapid-fire reply key,” convey sentiments avoided in carefully crafted memos. Breaches in netiquette, such as flaming, may not result in retaliation. However, they often create negative images of the perpetrator and, if work related, of that individual’s employer. Certainly, understanding group conventions and social politeness norms gives one an advantage.

Factors influencing flaming include the degree of anonymity and the likelihood of continued interaction (e.g., whether participants frequent a list or chat room, or otherwise know each other). Further, sometimes inhibition is evidenced in flames (e.g., dots inserted in curse words and variation by context), suggesting that group norms develop.

FLEISCHMAN, DORIS ELSA

Doris Elsa Fleischman Bernays was born in New York on July 18, 1891, and died July 10, 1980, in Cambridge, Massachusetts. Along with her husband, Edward L. Bernays, she was an important contributor to the founding of public relations in the early 20th century and a prominent feminist.

Doris Fleischman was born to Samuel Fleischman and Harriet Rosenthal. Her father was an attorney and, much to her benefit, believed that women should be educated and useful. She was educated at Barnard College and graduated in 1913, having studied English, philosophy, psychology, and music. After completing her bachelor’s degree, she began work at the *New York Tribune* as a reporter and editor for the women’s pages and the Sunday edition. She gained notoriety at the *Tribune* as the

first newspaperwoman to report a prizefight. An active feminist throughout her life, Fleischman was a member of the Lucy Stone League, the Woman Pays Club, and Women in Communications, and she “participated in the first Women’s Peace Parade in New York in 1917” (Mayeux, 1999, p. 691). In 1919, she joined Edward Bernays in the practice of what Bernays had called “public relations counsel.” Three years later, in 1922, the couple wed.

Fleischman kept her maiden name and caused quite a media spectacle when she and Bernays convinced the desk clerk at the Waldorf-Astoria to allow her to sign the guest register as “Doris Fleischman” instead of Mrs. Edward Bernays. The couple were well-known members of the Lucy Stone League, an organization committed to preserving women’s right to keep their birth name after marriage. Bernays and Fleischman achieved more notoriety when Fleischman became the first married woman in the United States to hold a passport in her own name. Fleischman made the headlines again in 1929 when she and Bernays convinced the New York Department of Health to allow her to put her name, Doris E. Fleischman, on the birth certificate of their daughter. Fleischman and Bernays would eventually have two daughters, Doris and Anne.

After their marriage, Doris and Eddie (as only Doris called Edward) became equal partners in his business and signed legal documents to that effect. Bernays worked for years to be labeled the “Father of Public Relations.” Whether he is the originator of the profession is a point of contention; however, Bernays is the originator of the term *public relations* and was the first to use the word *public* to describe those who have an interest in an issue. Though Bernays garnered almost all of the glory and fame from public relations, Fleischman was instrumental to the foundation of public relations. Her counsel with Bernays and her work behind the scenes helped *public relations* become a well-known word and won legitimacy for their firm. Fleischman and Bernays depended on one another professionally, personally, and intellectually. Fleischman most often was a mitigating influence on Bernays’s grand schemes, and Bernays was Fleischman’s public voice. Larry Tye believed that Fleischman’s “most valuable contribution to the practice was in the brilliant way she compensated for Eddie’s shortcomings” (1998, p. 125).

In her 1955 novel, *A Wife Is Many Women*, Fleischman refers to her and Bernays’s relationship as a “double partnership” (p. 163). During the 1920s this partnership was a modern idea. Fleischman wrote, “In the early days of public relations I was an exception in a masculine world. Silk and luggage manufacturers, radium miners, science institutes accepted me with polite surprise” (p. 171). The amount of work and ideas that Fleischman contributed to the partnership cannot be underestimated. While Bernays had an office at ground level where he often met with clients, Fleischman’s office was upstairs out of the public eye, and there she went daily to strategize, draft press releases and speeches, and plan campaigns. Bernays usually consulted with Fleischman after hours, and often her only contact with clients was when she hosted them at her and Eddie’s lavish parties at their home. The one shining example of Fleischman’s work with clients was the National Association for the Advancement of Colored People (NAACP) convention in 1920; she traveled to Georgia to consult with the governor about the convention, which was hailed as a great success and received evenhanded treatment in both the northern and southern press. It is doubtful that Bernays himself could have handled the convention with such aplomb. Usually, however, Fleischman was planning and writing in the background, with Bernays up front with all of his charisma and self-confidence. Susan Henry argued, “They were an excellent team; they complemented and respected each other, and were able to do things together that neither person—probably no single person—could have done individually” (1997, p. 54).

Fleischman’s most significant contribution to the field of public relations was her work on strategy and planning, which are considered management-level functions. She was not only an excellent technician, writing speeches and releases, but she was also a conscientious planner and innovator in public relations campaigns, such as the Lithuanian National Council’s effort to be recognized as a state, and the Lucky Strike cigarettes Green Ball. For Bernays’s part, he happily encouraged his wife to keep her name, join feminist organizations, work in the background (as was her wish), write for the business, and even explore creative writing. In *Biography of an Idea*,

P. E. Mayeux (1999) cites Bernays, who wrote of Fleischman in 1965,

Over the years [Doris] has been my most valuable asset. She has contributed heavily to the policy and strategy we have advised our clients to carry out. Her balanced judgment carries overriding weight with me. And she has unique compassion and understanding. (p. 672)

In 1961, Fleischman and Bernays moved to Cambridge, Massachusetts, claiming that they were retiring. In truth, they were merely scaling back and slowing down. Bernays wanted to finish his memoirs and open a small agency where they could give advice on, but not plan, public relations. According to Susan Henry, Fleischman had “left behind a circle of strong, close women friends with whom she had much in common, and she found in Cambridge few professional women with whom to associate” (1997, p. 6). The move brought her closer to their daughters and their families living in Cambridge, but far away from the life and the friends she had in New York. Fleischman eventually found companionship through mentoring younger women by joining groups such as Theta Sigma Phi, and by writing for and running several contests sponsored by the Edward L. Bernays Foundation.

It is interesting to note that Fleischman published only a smattering of her work. In the beginning, she wrote short stories in grade school and college that she claimed only Bernays had read. Early in her partnership and marriage to Bernays she began publishing *Contact*, which became the house organ for the firm of Edward L. Bernays, Counsel on Public Relations. *Contact* was published for 10 years and was circulated to over 15,000 people four times a year. It was able to get the word out about public relations in a conservative and informative fashion. She edited and published a book titled *An Outline of Careers for Women: A Practical Guide to Achievement* in 1928, and she published articles in magazines such as *Ladies' Home Journal*, *American Mercury*, *McCall's*, and *Independent Woman* that discussed topics such as working women, public relations, and feminism. Fleischman also contributed book chapters to books that Bernays wrote or edited concerning public relations. Her semiautobiographical novel, *A Wife Is Many Women*, was published in 1955 under the name Doris Fleischman

Bernays. She had decided to use the name Bernays, but throughout the rest of her life she was known equally well by both names. *A Wife Is Many Women* caused some controversy because daughters Anne Bernays and Doris Bernays stated that many of the events detailed in the book never occurred. Fleischman described herself in the book as an average woman, but it is obvious that she was far from average. Significant awards that she achieved included Theta Sigma Phi's (later Women in Communication) Headliner Award and an Honorary Doctor of Law degree from Babson College (Henry, 1998). Late in her life Fleischman wrote book reviews for the *Worcester Sunday Telegram*, and she and Bernays self-published *Progression*, a book of her poems. Her most important written contributions to the field of public relations were *Contact*, numerous speeches, and campaign plans that helped to put public relations on the map. Although she was a pioneer in the public relations field, she gained little renown during her life for her work. On July 10, 1980, Fleischman died after experiencing a stroke.

FLIER

A flier, also called a handout, is a one-sheet, printed form of collateral material. Like other communication tactics or tools used in public relations, a flier must be developed to appeal to a particular target

audience, contain a key message, and attempt to achieve a specific objective. Some objectives might include increasing awareness about a service, educating a target audience about a program, or encouraging a key public to attend an event. Often 8½ × 11 in size, a flier must be succinct, have few words, and include type or a graphic that appears in broad strokes. Since space is limited on a flier, uncomplicated graphics and clean typefaces are preferable. They are printed on one side of a sheet, have a short shelf life, and are not folded. Fliers, along with brochures, newsletters, and posters, are considered a form of direct media rather than mass media. As a form of direct media, fliers are generally posted on bulletin boards, placed in information racks, distributed through email, displayed on a website, and handed out interpersonally. Oftentimes, they are used as mini posters, which means that the message should carry at a distance of 10 feet. If they are placed on counters or inserted into the fold of a newsletter, the information does not need to carry over a distance. As a tool of persuasion, fliers should adhere to publication principles. They should attract attention, stimulate interest, create a desire to act, and contain claims that are supported by facts.

Relatively inexpensive to produce, fliers are timely and disposable. Many have a single purpose, which is to announce an event or inform a specific target audience about something of interest. No matter the method of distribution, fliers must be able to get noticed in a cluttered environment and should adhere to the principles of layout and design. An effective design should include a layout with proper balance, the balancing of elements either symmetrically or asymmetrically along an implied axis; dominance, an attention-getting element that stands out by its size, tone, or shape; unity, a sense that the message is an integrated and cohesive whole; proportion, the spatial relationship of elements similar in nature; and flow, which promotes eye movement and direction in a layout.

Since many public relations practitioners adhere to the writing style of the Associated Press, it is important to clarify terms. According to *The Associated Press Stylebook*, a flier is the preferred name for a handbill. On the other hand, the word *flyer* refers to the name associated with certain trains and buses.

FLOGGING

Flogging, short for *fake blog*, is a term describing a practice in which an organization or an individual adopts a fake persona on a blog or online discussion board. A common type of flogging occurs when a public relations practitioner pretends to be a customer in order to post positive reviews of products on shopping websites or specially created blogs.

The term gained prominence in the United States in 2006 following three high-profile controversies involving corporations and public relations firms. The first controversy involved Sony and a viral promotions firm called Zipatoni. To promote the PlayStation video game system, the companies created a blog titled “AllIwantforxmsisapsp.com.” The blog was designed to look like it was created by teenage video game enthusiasts and did not contain any disclaimer that it was produced by Sony or Zipatoni. Several readers, suspicious of the blog’s promotional tone, examined it carefully and discovered that Zipatoni created it. After an outcry from consumer advocates, the blog was deactivated.

A second controversy involved McDonald’s and the public relations firm JSH&A. To promote a contest, the companies created two blogs, one by a past contest winner and another by a person called Stanley Smith who described himself on the blog as an ordinary guy, a security guard in suburban Chicago. On the blog, Smith posted videos showing the significant effort he was taking to win the contest. Observant readers questioned the truthfulness of the blog; it was pulled down following an admission from JSH&A that Smith was a fake person.

A third controversy involved Walmart and the public relations firm Edelman. It began with the launch of a blog titled “Wal-Marting Across America” that featured a vacationing couple driving a recreational vehicle (RV) across the United

States. On the blog, the couple showcased employees who said positive things about Walmart. Journalists investigated the blog and found that the couple were not ordinary people but paid professionals. After these revelations, the blog was deactivated and Edelman apologized.

These three cases as well as other widely popularized cases prompted the U.S. Federal Trade Commission to crack down on flogging and other online misconduct. In 2009, the agency announced strengthened rules that require those posting on blogs or review sites to refrain from fake content, to disclose compensation being received, and to reveal conflicts of interests. Fines for those caught flogging can be up to \$11,000.

FOCUS GROUP

A focus group is a group of people that provides some structure to a research setting. Most focus groups consist of 5 to 15 members, a moderator, and often a moderator's assistant. Focus group sessions are almost always tape-recorded or videotaped for

later analysis. Analyses can range from a simple review of what the moderator understood, to what the members discussed or concluded, to complex content analyses of transcripts from the recorded groups, which may include psychological interpretations of the members' nonverbal behaviors.

The focus group provides public relations researchers with information from a variety of people focusing on a single person, product, event, or organization. Focus groups have some similarity to in-depth interviews in that a focus group facilitator asks predetermined questions to focus group participants; they differ in that group members can add on to ("tag") another member's answers or comments, and often are encouraged to do so.

The focus group is found in public relations primarily because it can be conducted quickly and fairly inexpensively. Focus groups are also used to pretest a promotion, product, or message, to prepare for larger surveys, or to provide more in-depth analysis of a survey in order to better understand the survey's results. A focus group, then, provides information from a variety of individuals about some issue or concern under some form of moderator control.

As noted, a major advantage of a focus group is its ability to gather "rich" data from the individuals assembled to discuss the research object. The disadvantages of focus groups are the cost of moderators and the inability to generalize to larger populations and to demographic group members. Because a focus group's results are heavily dependent on the skills of the moderator, obtaining a trained moderator is essential to conducting a good focus group. Although focus groups are typically regarded as a cheap way to gather information, the primary cost associated with them is the moderator. A good moderator can cost more than half a focus group's cost. The trained moderator, however, can overcome some of the problems associated with members, such as over- and undertalkative members who either try to monopolize the discussion or avoid discussion altogether.

Most focus group members are volunteers, and volunteers often participate because they are interested in the topic. Volunteers do not represent the larger population; therefore, the results cannot be generalized to that population. In most focus group situations, at least two and often three

different focus groups are conducted to ensure that what one group says is similar to what a second group says. The third group will be used if the first two groups differ. When the research question does not consider demographic or psychographic differences, three groups per demographic or psychographic are required.

Depending on the research question under investigation and whether it requires organizational members to participate, some of whom may be subordinate to others, focus groups may differ in how they are conducted. Most focus groups meet in an arranged room, typically around a table or chairs placed in a U-shape when the research is gauging reaction to some promotion or product. Some rooms are equipped with two-way mirrors and hidden microphones so that observers can evaluate and rate the interaction; other rooms simply have a table and chairs and a tape recorder or video recorder and cameras out in the open. In a typical focus group, moderators sit at the end of the table, or in the table's 12 o'clock position, from which they can control who speaks through both verbal questions to specific members and eye contact or head nods to encourage or discourage member participation. The typical focus group lasts between one and three hours, including planned refreshment and bathroom breaks. The moderator operates from a scripted schedule of opening statements and "key" questions; sometimes the moderator will have written probe questions to further look into member responses. To get all members to talk, a typical opening will reinforce that all conversations—even recorded ones—will be edited so that no one will know who said what, that members' comments are confidential, and that their anonymity will be maintained. This is usually reinforced as well at the end of the focus group.

In organizations where the group members may feel what they say could cause them problems later, a different kind of focus group is used: a *known group*. In the known group people are drawn from the organization's hierarchy. The technique requires that two different meetings take place. In the first, members write their responses to the moderator's questions, and in the second they meet to discuss those responses. In some instances the questions are sent to members prior to the focus group's

meeting; in others, they are gathered at the first meeting. Regardless of when the responses are gathered, the real discussion takes place once the now anonymous responses have been reproduced on large sheets of paper, usually taped to the room where the group meets. Discussion is then focused on the written responses, whether they may have come from a CEO, a CFO, or a clerk. Thus, no attribution of source gets in the way of ideas being discussed. The known group method takes longer to conduct and requires additional assistance and supplies. However, it works well in situations where superiors must interact with subordinates.

Focus groups are analyzed both informally and formally. Informal analysis occurs when the researcher debriefs the moderator, moderator's assistant, or both. This is an immediate debriefing after the discussion in which the moderator's feelings and intuition are put down on tape or paper for later analysis. The formal analysis is made from transcripts created from the audio- or videotaped discussions (all names or references to members are removed in the transcripts), and a content analysis is made of the group's discussion.

The focus group provides public relations researchers with a rich, in-depth analysis of perceptions toward some research object. The group's discussions are kept on track by a trained moderator and are typically recorded and submitted to message analysis. While focus groups are common in public relations and can be conducted quite quickly, they are not cheap when conducted correctly. A single focus group's discussion is neither reliable nor valid unless it has been compared against another group's discussion.

FOLLOWER/MEMBER NEWSLETTER

Utilized by most nonprofit organizations, including charitable nonprofits, trade associations, and political interest groups, the follower/member newsletter is an extremely popular public relations tool for fulfilling the information needs of a specific audience. This type of newsletter reaches out to members, alumni, volunteers, consumers, clients, boards of trustees, staff, and allied organizations of a particular organization in which audience members have a valid interest or formal membership.

Follower/member newsletters serve as the “voice” of the organization. Their audiences are made up of internal and external publics. Members, who pay dues, generally are defined as internal publics because they can be viewed as having an investment in the organization, similar to that of a stockholder. Followers often are viewed as external because their expected outcome deals more with information seeking—finding out about issue positions rather than using the organization as an extension of one’s own voice in public policy discussions. Usually, they do not have as strong an investment in an organization as members do, nor do they receive the special benefits that are accorded to members.

These newsletters, like other directed newsletters, strategically execute the public relations and marketing plans of an organization. The goals of follower/member newsletters can vary, but generally they are used to communicate newsworthy information about the sponsoring organization. In addition, newsletters are a valuable tool for fundraising: motivating existing donors, increasing gifts, recognizing the service contributions of volunteers, and demonstrating that the organization is a good steward of funds—an important responsibility for nonprofits. Some organizations also use these newsletters to market their services. Supplementing these common goals, follower/member newsletters seek to remind readers about the purpose of the organization, as well as to

justify the existence of the organization in the community at large.

The follower/member newsletter is valuable to constituents who care about the mission of an organization. For instance, Health Plus, a New York City–based nonprofit whose mission includes improving access to health care for uninsured and underserved families, publishes a member newsletter that is available online. The newsletter is designed to provide Health Plus members with information about various health topics and health care providers. Professional associations, such as the National Futures Association, rely heavily on newsletters to keep their dues-paying members informed. Advocacy groups dedicated to particular issues provide a good example of organizations that use follower newsletters to their advantage. Citizens interested in certain social, economic, and political issues—for example, civil rights, abortion rights, economic reforms, or a particular piece of legislation—can subscribe to many of the available nonpartisan newsletters, which will allow them to follow the latest developments relating to the issue or legislation without actually being a member of the group.

The form and content of these newsletters vary from organization to organization. Some newsletters consist of one or two stories with little or no regard for design, whereas others are elaborate showpieces of color and flair. Depending on their content, they represent all four models of public relations practice. Newsletters from many human services charities, for example, are based on the press agency model. Their pages are filled with propaganda and stories designed to stir readers’ emotions. On the other hand, nonprofits categorized as business leagues, such as chambers of commerce, usually produce newsletters representative of the public information model.

The organization and development of a follower/member newsletter are very similar to those of other types of newsletters. Decisions on the audience (members or followers), the articles to be featured, the budget, the format, the frequency of distribution, and the approval process should all be taken into consideration before beginning the newsletter. Because members will expect to receive the newsletter regularly, care should be taken to ensure that issues will be published in a timely manner. Also, because the newsletter is targeted to a very precise audience with very precise information needs, special attention must be given to see that its content

addresses readers' needs. Providing information that is useless will alienate the targeted audience. Moreover, the newsletter needs to convey to readers that the organization is carrying out its mission effectively and efficiently. Finally, it is important to realize that a follower/member newsletter is not the end objective of the organization but merely a tool for communicating with strategic publics.

The biggest change in follower/member newsletters in the past decade is that they increasingly are being published and distributed electronically. A variety of ways are used. The simplest, adopted by many of the smaller, less affluent organizations, is sending the newsletter via email in text format. This allows the information to be transmitted through an email program without the inconvenience of linking to webpages. Email links are another option. Links are embedded in an email message, allowing members or followers to access the organization's newsletter on its website. Web newsletters can be graphically enhanced because the bulk of the information is not directly sent to the reader. Organizations with sensitive or private material are able to utilize sophisticated log-in programs that provide regulated access to members only. In addition to security, such programs give members a sense of uniqueness and make them feel they are a legitimate part of the organization.

Growing use of the Internet is blurring the lines between the traditional newsletter and organizational news in general. In the past, members and followers had to wait for information on a set time basis—monthly, quarterly, semiannually, and so on. Today, organizations are able to provide strategic publics with continuous, up-to-date information. Although traditional follower/member newsletters still will be needed in the foreseeable future, the Internet will continue to revolutionize the way organizations communicate with their members and followers.

FONT

Font refers to a complete set of characters or type with similar shape, style, and proportions; fonts are used in printing, graphic design, and viewing on computer monitors. For example, *The New York Times* is printed using a widely recognized font created especially for *The New York Times* in 1931, called "Times." The font selected can have a dramatic impact on the feeling of professionalism, playfulness, or excitement engendered by a document.

Fonts are grouped into categories such as Modern (Times Roman), Old Style (Bookman Old Style), Decorative (**JUNIPER**), Script (*Swing*), and text letters (Old English). Fonts are also grouped into serif fonts, or those with "serifs" (curls or flourishes on the ends of characters), and sans serif fonts, or those without "serifs" or curls or flourishes. Arial is a sans serif font, and Times Roman is a serif font.

Fonts that share the same basic shape, style, and proportion but vary in weight, width, or size are called font families. An example of a font family is Helvetica, which includes Helvetica regular, *Helvetica italic*, **Helvetica bold**, **Helvetica black**, Helvetica narrow, **Helvetica compressed**, and others.

One of the rules of effective typography is to use only a few fonts (or a single font family) per document. By using a font family like Helvetica, an individual has the ability to create headings (using Helvetica black, for example), or to change the aesthetic feel of a document by using a narrow typeface or reducing the character weight.

Fonts are measured in points. There are 72 points per inch. Here is Times New Roman in six different type sizes:

6 point: ABCDEFGHIJKLMNOPQRSTUVWXYZ

9 point: ABCDEFGHIJKLMNOPQRSTUVWXYZ

12 point: ABCDEFGHIJKLMNOPQRSTUVWXYZ

15 point: ABCDEFGHIJKLMNOPQRSTUVWXYZ

18 point: ABCDEFGHIJKLMNOPQRSTUVWXYZ

24 point: ABCDEFGHIJKLMNOPQ

A 12-point font will typically yield six lines per inch of text at single spacing. We say “typically” because, as Michael Bruno explains, “Corresponding letters in the same size type may vary in height. We say that the face is either small on body . . . or large on body” (2000, p. 37). For example, the following are all 24-point lowercase A’s:

a a a a a a
il a a a

The space between lines of type is called “leading” (pronounced *ledding*). Although most personal computer users are accustomed to selecting “single,” “space-and-a-half” or “double” spacing from the menu bar of their word processing programs, in professional practice leading is measured in points. Twelve points of leading applied to a 12-point font (called “solid” or single spacing) will yield six lines per inch of text. Using 24 points of leading with a 12-point font will result in double-spaced lines of text, or three lines per inch of text.

Adjusting the space between characters is called *kerning* and is also measured in points. Kerning can be increased or decreased to achieve specific typographic effects.

FORMATIVE RESEARCH

All public relations activities begin with formative research, an effort to understand the current situation. A public relations activity is like a journey. The better prepared a person is for a journey, the more pleasant it will be. For practitioners, the better prepared they are for a public relations activity, the more productive it will be for the organization or client. A public relations effort is driven by the needs of the situation. Practitioners try to overcome problems, or things that threaten the organization, or develop opportunities, or things that could benefit the organization. Often called other names such as situational analysis or background research, formative research helps the public relations practitioner understand the problems or opportunity at hand. Formative research is the raw material for developing strategy. Two critical pieces of information for strategy development are stakeholders and the exact nature of the problem or opportunity.

Practitioners should know the stakeholders involved with the situation. They need to identify

which stakeholders might be allies and support their efforts and which stakeholders might oppose their efforts, and they need to collect detailed information on who their target audiences might be. Detailed information about the target is critical when selecting communication channels and developing messages. Practitioners must know the target so that they can select media that will reach and messages that will appeal to the target. Practitioners also need to understand what makes a situation a problem or opportunity. They need to know the cause of a problem if they hope to solve it. Effective public relations solutions begin with a detailed understanding of the problem. Similarly, practitioners should understand why a situation is an opportunity if they are to effectively utilize it. In short, it is important for public relations practitioners to determine what harms or benefits a situation presents to an organization or client. An extended example will help clarify the role of formative research.

MacCorp is located in a moderate-size Midwestern town of about 50,000 people. Each year the local paper does an assessment of community needs and prints the top 10 issues that are important to the local community. Number 5 on this year's list was a lack of park and recreation facilities. MacCorp has some unused land that would be perfect for a park: a wooded area and a level section ideal for soccer fields. The paper's survey presents MacCorp with an opportunity to improve community relations by addressing one of the community's top needs. The public relations department's first step is identifying the key players involved in the park and recreation issue. This would include all relevant local government officials, any community groups interested in parks, local sporting groups who might use the park, local neighborhoods near the proposed site, and any state or federal agencies that might have a say in the park construction, such as the Environmental Protection Agency. Next, the public relations department seeks out more information about each stakeholder, such as how strongly each is committed to the issue, what each would like to see in a new park, and whether or not some groups might oppose the company's efforts.

The public relations department then needs to specify the opportunity. It must clarify what a

“need for parks and recreation” means. The focus would be on user needs—what people want from a park. Obviously understanding the key players will go a long way toward understanding the opportunity. Still, the public relations department needs to focus its efforts and make sure it understands what the opportunity really is. One starting point would be for someone from the public relations department to talk to a number of community leaders about the potential park. Let us say the leaders keep mentioning the lack of soccer fields and tennis courts in the community. The public relations department then constructs a survey that has people rate the value of 10 different park amenities, including tennis courts and soccer fields. It mails the survey to community members and tallies the results. If the survey says that tennis courts and soccer fields are the two most valued amenities, the public relations department can be confident that building those two amenities will please the community.

The formative research helps MacCorp's public relations department develop its strategies. By researching the stakeholders involved in the situation, the public relations people know who might help or hinder their park community relations initiative. MacCorp also knows whom they will need to target with their messages. By researching the opportunity, the public relations people can be confident that their community relations initiative will be received positively. They will know that their planned park meets the needs of the community. The next step is to convert this information into a strategy by setting objectives, specifying target audiences, designing messages, and selecting tactics.

The amount of formative research a public relations practitioner conducts depends on how much or how little the practitioner already knows about the situation. The less practitioners know about the situation, the more research they will need to conduct before they can begin the public relations activity. For seasoned public relations practitioners, many situations will be fairly routine and require very little additional research. Instead of actively searching other sources, they can draw upon past experiences and databases stored in their computer files to guide their response. The search is internal and quick. Consider

the example of a manager receiving an award. The award is an opportunity to generate positive publicity for the organization. Deciding to send out a pitch letter and news release is fairly routine when someone has been doing public relations for years. Furthermore, a practitioner would have all the requisite media contact information in a database on a computer. The practitioner knows the key stakeholders (the media outlets), what types of stories they prefer, and what this opportunity means. If the situation is completely new to the practitioner, a lot of formative research is necessary before the strategic aspects of the public relations efforts can be developed.

Formative research provides the raw material needed to construct a public relations effort. Strategy becomes the map for a public relations effort. But how does a practitioner build a map? In public relations, formative research provides the information needed to construct the map. The speed at which a practitioner collects the requisite information depends on how much relevant information the practitioner already possesses and how much he or she needs to discover. Formative research is the first step in the development of a public relations activity. If a practitioner begins by going in the wrong direction, the results of the public relations effort will probably be negative for the organization. Careful, systematic formative research points a public relations practitioner in the right direction and increases the likelihood of an effective public relations activity.

FORUM, ONLINE

From its beginnings the Internet has generated the infrastructure for online fora, spaces for sharing information in structured environments. Early manifestations were presented as message boards, employing basic graphical interfaces, often requiring membership, and quickly developing protocols and self-policing cultures. Presentation was largely based around threaded conversations, leading to (loosely) structured narratives. The forum model, exemplified by the popular Usenet associations that emerged in 1979 and CompuServe led to walled garden (subscription) approaches, including America Online (AOL).

Around 1999, Web 2.0 (the “writeable web”) offered broader accessibility and a more attractive user experience, opening the way for highly developed commercial iterations such as MySpace, Bebo, YouTube, Facebook, Instagram, and Twitter, which can be seen as vast consortia of online fora, endlessly stratified, interlinked, and segmented. Although the interfaces are generally more sophisticated, many online groupings retain general principles that have clear roots in the earliest online fora. Enthusiast, hobbyist, and fan sites can present the most active, engaged, and knowledgeable discussion on specialized topics. Likewise, gaming communities can be underpinned by message board-style fora, including MUDs (multiple-user dimensions) and MOOs (MUDs, object-oriented). Craigslist, the online version of the newspaper classified adverts, and the eBay auction network are prominent examples of a further iteration.

Message boards and fan-based fora can become semi-official resources for commercial operations, for instance in generating or curating FAQ (frequently asked questions) or Q & A (question and answer) pages linked to technology, hardware, and software.

TripAdvisor, founded in 2000, is an example of an online forum with high reputational impact that retains vestigial roots from message boards. Sites that develop content from reviews invite issues of transparency, authenticity, and legitimacy, not least when the use of nicknames, avatars, or (partial) anonymity is widespread and encouraged.

For those who accept publics as core to public relations activity, identifying the locus of conversation and critical discussion on a topic represents an essential element of practitioner activity. Discrete interaction in the online environments is often characterized by porosity, with conversations typically spanning multiple platforms and channels. The duplication and remediation inherent in the processes encourages both potentially undesirable leakage as well as constructive cross-fertilization and repurposing. Such change is ongoing and perpetual.

Online fora are often concerned with collaborative discourse, ranging from the Linux community and, say, Wikipedia, launched in 2001, which refine code or text toward shared purposes, to the visual communities of Pinterest and Instagram. Less obviously, Amazon can be seen as an ecosystem of peer-recommendation fora, based on reviews, and underpinned by less visible networks created by social bookmarking and tagging. Wikipedia comprises negotiated entries subject to rolling revision. These processes are made visible through edit histories and discussion page threads that act as expressions of aggregated reputation.

It is tempting to suggest online fora must have architecture, a visual shape determined by code, but it would be wrong not to recognize the loose communities of interest created by, say, Twitter hashtags (often linked to second screen activity such as sporting occasions or reality TV and game shows).

Although all online interaction is in some way collaborative, it is perhaps most helpful to limit the term *forum* to those areas in which the collaboration is explicitly intended. Many fora are closed, secret, and in some cases well hidden; hackers, activists, and even criminals create and benefit from fora.

FOUCAULT, MICHEL, AND PUBLIC RELATIONS

French philosopher Michel Foucault's (1926–1984) work has offered valuable insights for

public relations scholars and practitioners who seek to understand, interrogate, or critique the role of public relations in society. In specific, Foucault was interested in the institutional systems of thought that frame or influence human understanding and experience (Rabinow, 1997). Application of Foucault's philosophical insights to the practice of public relations supports the development of theory and advances understanding of public relations as a discourse practice with power effects and ethical obligations.

Public relations scholarship may be informed by both the research methods Foucault deployed and the philosophical themes he explored. Foucault adopted a technique he referred to as *problematization* to examine how certain systems of thought and practices come to be conceived in a particular way and to question “the conditions in which human beings ‘problematize’ what they are, what they do, and the world in which they live” (Foucault, 1984, p. 10). In order to effect a problematization, Foucault deployed two historically oriented research methods to investigate shifts or transformations in institutional practices. The first approach he referred to as *archaeology*—an approach that identifies discontinuities in systems of thought and tracks differences in political, economic, institutional, and societal practices. For public relations, application of this technique would facilitate research that seeks to understand the role of public relations in driving political, organizational, or sociocultural change through a focus on disruptions or breaks within the status quo and the communication practices associated with those disruptions.

The second research method, Foucault termed *genealogy*, or “writing a history of the present” (Dreyfus & Rabinow, 1982, p. 119). Genealogy involves tracing current situations and practices back to their historical roots and undertaking a historically oriented interpretation. Genealogical approaches assist scholars to explore the historical origins of particular public relations practices and add to the growing interest in the history and evolution of public relations.

Although both approaches are historical in nature, they marked a shift in Foucault's research interests. Archaeology focuses on discourse and language-related issues whereas genealogy focuses

on subjectivity or the relationship between individuals and how they are constituted as subjects of, or subject to, institutional practices. Foucauldian research approaches examine the role of public relations in the production of meanings, the strategies of power, and the propagation of knowledge and highlight how certain systems, discourses, power regimes, and practices are legitimated and normalized.

The philosophical themes in Foucault's work may be broadly categorized as focusing on the study of discourse, power, and the subject. Within his work on discourse, Foucault was concerned with how discourses are formed and transformed. He suggested that shifts in discourse occur through deliberate attempts to modify the boundaries that determine what is included—and excluded—within a discourse, the identities and roles for discourse actors, the language that shapes and determines meanings, and the modes of circulating a discourse (Foucault, 1991b). As a result, how we understand the world and the associated sets of statements, rules, and meanings that form the objects, concepts, subjects, and strategies within a discourse are transformed. In 1972, Foucault wrote that the challenge for those who seek to transform discourse is “separating out from among all the statements which are possible those that will be acceptable” (p. 197). For example, a public relations practitioner may attempt to undermine or transform societal discourses about climate change by promoting alternative scientific findings, introducing an economic discourse, or positioning opponents as “greenie” radicals.

Issues of strategy, relations, and power effects underpin Foucault's work on power in *Power/Knowledge* (1980), *Discipline and Punish* (1977), and his essay on “Governmentality” (1991). Key questions in these works problematized power by asking “What took place here?”; “Can one speak of interests here?” (Foucault, 1980, p. 204); and “What does struggle mean here?” (p. 209). In this way, attention is directed to the exercise of power within moments of change. Public relations practitioners exercise a form of discursive power when they seek to shape ideas, relationships, and identities that are valued and privileged within a discourse by regulating who may speak, what may be spoken, the positions within a discourse, and which meanings achieve status as the legitimated truth (Foucault, 1978). The themes of biopolitics

and governmentality within Foucault's work integrated discourse and power concerns—or what Foucault in 1980 termed *power/knowledge*. Public relations efforts regularly seek to establish and popularize particular discourses or power/knowledge regimes through the exercise of discursive power. Those efforts do not always succeed; Foucault's work offers not only the means to examine and critique public relations efforts but also to understand or mobilize resistance.

Foucault (1980) conceived of power as a positive and productive force: “What makes power hold good, what makes it accepted, is simply the fact that it doesn't only weigh on us as a force that says no, but that it traverses and produces things, it induces pleasure, forms knowledge, produces discourse” (p. 119). It is here, perhaps, that Foucault's work has the potential to affect the greatest influence on public relations. Application of a Foucauldian approach to power may lead us to rethink the nature, role, and influence of public relations practice by including work that is designed to establish positive sociocultural change such as cause-related nutrition campaigns or environmental awareness and protection efforts. Similarly, Foucault's notion of power as a relational force that circulates through networks has implications for research that examines the role of public relations in social media ecologies.

Foucault's study of what he termed *subjectivity*—the technologies through which individuals have constituted and transformed themselves as subjects—has implications for public relations. In 1988, Foucault identified four discourse “technologies” that allowed people to understand and transform themselves: technologies of production, sign systems, power, and the self. He was particularly interested in how individuals constituted themselves as ethical subjects in relation to a moral code and how to undertake a stylization of the self. His work on subjectivity has implications for critical researchers seeking to investigate how public relations power impacts on individual identities and for public relations practitioners engaged in the production of corporate identities and personal brands.

Foucault, in 1984, challenged us to “know how and to what extent it might be possible to think differently, instead of legitimating what is already known” (p. 9). This challenge has been taken up by a number of public relations scholars who integrate

Foucauldian techniques, themes, and critiques within their work (see Motion & Leitch, 2009). Applications of Foucault's work to the study of contemporary issues offers insights into how public relations works and why it works and leads us to not only focus on meanings and power but to also problematize what is meaningful, truthful, and moral.

FOUR-MINUTE MEN

During World War I, the Four-Minute Men were a division of the Committee on Public Information (CPI) that helped persuade Americans to support the war effort; they did this by giving speeches, usually in movie theaters during intermissions. Theaters were particularly effective because 10 million to 13 million people attended them daily. These speeches helped mobilize support for the war and provide for the essentials of war. The Four-Minute Men overcame the primary weaknesses inherent in other communication channels so that they could present their message to the entire nation since broadcasting was not yet available.

Donald Ryerson originated the idea for the Four-Minute Men and was the first head of the division. The division was organized in a state-by-state network and eventually included all states in the union and eight territories. Each state or territory had a chairman who was responsible for coordinating activities and for picking the local chairmen, who, in turn, were responsible for the selection and training of the speakers. Despite receiving no pay or reimbursement for expenses, speakers were never hard to find.

The Four-Minute Men division of the CPI maintained control over the network of speakers, including the selection of address topics and the preparation of associated materials. Speakers were trained through a series of bulletins published by the division. From May 1917 to the end of 1918, 46 bulletins were published. Ten dealt with the organization itself. Of the remaining 36, 6 messages concerned raising money and 5 discussed conserving or acquiring food. These messages were essential for the nation to create the materials necessary for war.

Although each speech topic fulfilled a specific function, the bulletins usually provided speakers with some essential elements: an opening letter of encouragement from the division head; points to be covered in every speech and suggested optional points; sample speeches; and sometimes even answers for crowd objections. The speeches presented by the Four-Minute Men were normally delivered in theaters during the intermissions and were limited to four minutes. The organization had a series of auxiliary organizations, including groups with female speakers and Junior Four-Minute Men groups in schools.

George Creel wrote in 1920, "When the armistice brought activities to a conclusion the Four Minute Men numbered 75,000 speakers, more than 755,190 speeches had been made and a fair estimate of audiences makes it certain that a total of 134,454,514 people had been addressed" (p. 85). Creel noted that if allowances are made for those communities that made no reports, a final estimate would place the figures at 1 million speeches heard by 400 million individuals for the 18 months the organization was in operation. He also noted that for the total government expenditures of \$100,000 for the Four-Minute Men division, the organization accrued over \$9 million in financial benefits.

FRAME

A *frame* is a heuristic device that encapsulates and connects information objects about a subject of interest into a graphic image or a coherent story. The term draws metaphorical value from the cropping frame, limiting and focusing a viewer's gaze, while at once bestowing relevance upon subjects within the position or scope of its borders and irrelevance upon those without. Frames illuminate matters of personal or public importance, whether strategically produced or emerging out of ongoing communication. One important evolution in the understanding of frames is the media frame, which concerns itself with the materialization of frames in public discourse. Frames can also occur within or between individuals, groups, or societies without their materialization in media.

In each of these areas, frames can be examined at three levels of analysis. At their production level, frames sustain graphic images and a common vision of worldviews or ideologies, which tend toward their own transmission or perpetuation. Nations such as the United States frame their symbols in a worldview that is ostensibly widely shared by citizens. At this level, the most powerful frames hold sway by virtue of their institutionalization and fixed position above societal structures. That is, the adoption and adherence to a set of values or guiding philosophy to which a group of people adhere produce a frame of understanding that is shared by its group members. These members use the frame to organize and predictably qualify routine information. In one sense, the frame of *student as customer* can be thought of as a dominant frame that has expanded into the spheres of education, where it has become influential in valuation at a broader cultural level. By this cultural valuation, students are no longer thought of merely as persons who come to learn and earn a degree. They have become customers who expect treatment beyond that traditionally associated with a college education experience. If they don't like the product or service, they are allowed—even expected—to complain and seek *customer satisfaction*. At the content level, frames import a fixed meaning to key words, ideas, or entailments and bring coherence to words and phrases within or between communications. In education, discussions

of *customer service* direct dialogue, thereby implicating the frame of *student as customer*. Finally, at the effects level, frames become interpretive schemes used to process information, make judgments, and draw inferences, and can reveal the link between mass ideologies and policies. For example, in education, the customer service frame can govern procedures that assimilate business practices such as student evaluations.

An awareness of the value of frames helps public relations professionals better understand general trends in society. A thorough understanding of how frames work also aids public relations staff members in knowing their role and abilities as professionals:

1. A general awareness of the power of frames can assist public relations professionals in managing information so that they can clarify thinking, articulate alternative points of view, or more readily perceive alternative viewpoints less evident.

2. Public relations professionals can use frames in their research and evaluation efforts to track changes, monitor events, and identify new threats and opportunities in a given environment.

3. Public relations professionals may more readily express their needs and objectives with frames preferred by top management in order to accomplish organizational or public objectives. For example, public relations professionals commonly encase their agendas or activities in frames already accessible to management, such as those concerning the importance of *relationships*, or considerations of *return on investment*, *efficiency*, or *corporate reputation*.

4. Public relations professionals can work with management groups to identify and avoid fixed perspectives preserved by lasting frames. Indeed, prior research has shown that top levels of management often become trapped in their own preferred frames and do not easily entertain alternative points of view. Working with management through the concept of frames provides a way for public relations to serve as the organization's conscience by directing attention to the neglect of certain trends, issues, or publics.

5. Policy advocates can enhance their success by shaping information into coherent packages with standardized prevailing values, stories, and myths. Prevailing values and the like may include *efficiency*,

capitalism, or *rationalism*, all of which have gained considerable currency in this era as institutionalized frames. Public relations professionals can use framing concepts to adapt organizational interests to the established media frame of *newsworthiness* that news workers use in deciding what counts as news. That is, when public relations professionals are able to pitch stories or write press releases that emphasize themes favored by journalists (e.g., those characterized by proximity, human interest, or timeliness), such stories or press releases are more readily printed.

We are all privy and susceptible to frames, yet their effects are by no means equal. A frame's force at the production level determines the power of its effects. That is, individuals, organizations, or institutions whose frames are more widely circulated, such as through public deliberation or the mass media, prevail over others. Hence, those deliberating at the policy level, such as for business or government, acquire resources by successfully funneling their interests through existing, generally accepted frames. This is especially so for those working with frames that have become tacit over time or taken for granted. Conversely, challenging successfully promoted positions involves adopting their frames of understanding, or otherwise introducing similarly compelling values and beliefs in support of the challenge.

The use of the term *frame* as a theoretical model has origins in the work of psychologist Gregory Bateson and of sociologist Erving Goffman. From these two can be traced stages in the evolution of the term from the conventional analogy of the picture frame into academic theory and research methods. Media sociologists Herbert Gan, Gaye Tuchman, and Todd Gitlin later disseminated their works more broadly into other disciplines.

FRAMING THEORY

Framing, a rhetorical device that has received attention from scholars from various disciplines over the past three decades, is a conceptual framework for understanding the construction of arguments and the differential interpretation of public relations messages by audiences.

Framing is actually a metaphor that compares message construction to drawing a border around a painting or picture. The frame helps define the meaning of the message (a) by focusing attention on particular elements and (b) by excluding competing, distracting, or contradictory elements.

Framing draws upon the notions that message producers are involved in the construction of social reality and that message meanings are negotiated, not absolute; thus, framing theory falls within rhetorical and relativist (postpositivist) perspectives. This approach suggests that practitioners are prone to frame situations or problems in ways that are favorable to clients.

How Framing Works

Framing is central to the establishment and maintenance of mutually beneficial relationships because it helps organizations and key publics to develop common frames of reference. A frame essentially limits or defines a message's meaning. Both message creators and receivers are involved in the process. Frames reflect judgments made by message creators, who put information in either positive or negative frames, use particular semantic

phrases, and tell stories using particular syntactical, thematic, or rhetorical devices.

Framing biases the audience's cognitive processing of a message. Framed messages inevitably contain contextual cues that are intended to trigger associations with ideas stored in audience members' memory. These memory traces can be either positive or negative or can conjure up particular recalled images that facilitate processing.

Framing primes audiences to think about a topic in a particular way. For example, the abortion controversy might be framed as an issue involving (a) a medical procedure, (b) a religious or moral act, or (c) freedom to make personal choices. In fact, all three are involved, but depending on which frame is operant, audiences are prompted to interpret a message using different sets of memory traces or cognitive schemas. Framing affects cognitive processing by selectively influencing which sets of experiences the message draws upon and how audiences think about or define a particular topic. Most psychologists agree that people use processes of association and expectation to schematically make inferences and impute meaning that might not be manifested in the message itself. Importantly, audiences might or might not be conscious of these message-framing effects.

Types of Framing

The robustness of framing theory is evident in the many different ways in which the framing concept is used. At least seven different models of framing have been identified that have potential applications to public relations.

Situations

Researchers from anthropology and sociology were the first to examine the communication process using a framing paradigm. In anthropology, Gregory Bateson (2000) defined a psychological frame as "a spatial and temporary bounding of a set of interactive messages" (p. 191). In sociology, Erving Goffman used framing as the basis for studying human interaction and developed an elaborate system for analyzing human interactions. This tradition has been carried forward in studies analyzing discourse, language, and literary storytelling.

Framing of situations is routinely used by organizations to explain its actions. Framing is a critical component of bargaining and negotiation.

Attributes

Advertisers and other marketing communicators routinely use framing devices to promote particular characteristics of objects, events, and people. This process can be evidenced in practices as simple as writing captions under photographs that call attention to particular aspects of an illustrated product. Marketers regularly choose particular attributes or characteristics that they wish to promote (such as convenience) while ignoring others (such as higher price). Advertisers often want to conjure up images based on prior experience so customers can relive their experience. Product positioning similarly uses framing to differentiate a particular brand from all other competitors in a category. Both product attributes and positioning provide the basis for the product claims contained in advertising. Some researchers have identified framing as a form of second-order agenda setting whereby media are able to influence not only what topics people think about but also how they think about them. A particularly important aspect of framing involves the best way to describe attributes. For example, the fat content in meat might be described as 80% lean or 20% fat. Research suggests that positive framing consistently leads to more favorable evaluations than negative framing of the same fact.

Risky Choices

The framing of choices, one of the most extensively researched areas of framing, is based on the classical work of psychologists Daniel Kahneman and Amos Tversky. In 1979, these psychologists defined a frame as a decision maker's perception of "the acts, outcomes and contingencies associated with a particular choice" (p. 263). They argued that human decision making is inherently irrational because the prospect of loss has a far greater impact on decisions than does the prospect of an equivalent gain.

Their prospect theory suggests that people avoid risks when a choice is stated in terms of gains but will take greater risks when choices are stated in

terms of losses. This element has particular relevance for health communicators concerned with how people will deal with health threats, as well as for risk communicators who must encourage or discourage risk taking. However, framing of choices is also relevant to decision making in organizations, to negotiation strategies, and to other communications in which audiences are challenged to make choices. Although findings are generally consistent with prospect theory, the effect can vary based on the type and context of the risky decisions involved.

Actions

The framing of actions involves the question of how to achieve audience compliance when no risky choice is involved but when a decision might have positive or negative consequences. Take, for example, a membership organization that wants to charge different rates for attending an event based on whether registrants sign up before or after a specified date. Early sign-ups could be promoted as a discount (gain), and late sign-ups could be explained as a penalty (loss). Which is the better way to promote participation when the options are the same?

Valence framing and *goal framing* are terms used to differentiate between propositions stated in positive terms that focus on taking a particular action or in negative terms that focus on what will result by taking no action. Health communicators interested in getting people to quit smoking can make a strategic creative decision to either stress the benefits of a smokeless life or the deleterious effects of cigarettes on health.

The findings here are generally the same as for the framing of risky choices: framing of actions in terms of negative consequences appears to have greater persuasive impact than framing that emphasizes positive consequences. However, various factors can moderate results, including the audiences' level of involvement and their sense of self-efficacy (their perception of their own ability to deal effectively with a situation).

Issues

Framing plays a pivotal role in defining social problems (such as abortion) and the moral actions

attendant on dealing with them. Social researchers who adopt a constructionist approach argue that social problems are best understood as issues constructed by claims makers, who use framing as a tool in agenda building to create public interest in and concern about issues.

Many people today are chagrined by the absence of a robust public sphere of dialogue in which people can use philosophical and rational arguments to persuade audiences to adopt a particular position. Framing, some argue, confounds the deliberation process because people don't even agree on the definition of a problem—a necessary condition for coming to an agreement.

Frames define problems and thus delimit possible solutions. Researchers concerned with social movements have theorized extensively about the importance of framing, including the *frame enterprise* and *frame sponsorship*, the active effort of activists to position or frame a problem as being of a particular kind and source. Thus, advocates engage in a *framing competition*. Building coalitions can involve a variety of framing-related activities, including *frame alignment*, *bridging*, *alignment*, *crystallization*, *extension*, and *transformation*.

Responsibility

Framing an issue often implies both its cause and its solution. Yet another valuable rhetorical use of framing involves the framing of responsibility, or the attribution of causes to a particular actor, to the object or entity acted upon, or the environment or circumstances in which an event occurs.

Attribution theory deals with how people come to understand the causes of events or actions. Researchers have shown that attribution processes are easily biased by inattention, the salience of particular explanations, prior knowledge and extant schemas, and personal needs and motivations. Fundamental attribution error, for example, refers to the tendency to attribute people's behaviors to stable personality factors or dispositions rather than to situations or external causes. Actor-observer bias involves people attributing their own successes to themselves, while failures are explained as caused by situations.

In crises or disasters, people tend to watch to find the root cause and assign blame rather than accept such occurrences as acts of fate. Much

investigative reporting, for example, focuses on ferreting out the cause of a problem. Along this same vein, news tends to use episodic framing in which events or problems are explained as the result of people's actions, rather than thematic framing, in which causes are attributed to systemic problems in society.

News

Framing has become a focus of researchers interested in news reporting and in how dominant social themes or ideas are used to shape the way news is presented by the media. A *news frame* is a central organizing idea for explaining events that uses various symbolic and framing devices that support the main idea.

William A. Gamson, for example, suggested that media routinely use metaphors, catchphrases, exemplars, depictions, and visual images that culturally resonate with audiences. These framing devices represent conventions for communicating information and help media workers arrange seemingly disjointed events into a meaningful, organized interpretive package. Meanwhile, familiar frames provide mental maps to help audiences make sense of daily events.

Extensive research has examined how a wide range of topics has been presented by the press. These include how deviance from social norms, as represented in the coverage of disputes and protests, can be used as a tool of power to define whose view of the world will dominate. Concerns about biased media framing have usurped concerns about merely balancing coverage.

Implications for Public Relations

The central idea behind framing is contextualization: Framing puts information in a situational or cultural context that delineates how people evaluate information, comprehend meanings, and take action.

Public relations messages must be imbued with sufficient clues so that people can make sense of a message and be influenced by it. In developing programs, professional strategists strive to frame situations, attributes, choices, actions, issues, and responsibility in ways that achieve favorable outcomes for their clients. When conducting publicity,

it is equally important to use effective news framing to present a client's story in the press.

FREE MARKET SYSTEM

A *free market* is an economic system where economic decisions are left up to individuals and voluntary associations of individuals such as corporations. This is in contrast to economic systems where decisions are made by government agencies. In a free market, nearly all organizations engage in public relations, including private corporations and nonprofit organizations. In particular, organizations will use public relations when the actions they have taken on the free market are viewed

skeptically by the public at large, even if their customers view their actions favorably.

A free market system is best thought of as an ideal type, which no country has ever perfectly adhered to, but which all countries have in some degree. Today, all countries have a mix of economic decisions made by individuals and governments, though the mix varies widely. Additionally, governments place a variety of restrictions and regulations on activities in a free market. The primary role that government can play in a free market is the protection of persons and property from violence and fraud. Government intervention beyond this limited role is considered a deviation from the free market ideal.

Free Markets in Theory: Prices, Profit, and Loss

A free market system is controlled almost entirely by the laws of supply and demand. Prices and quantities emerge in such a system based on current consumer demand for any specific good and the conditions governing the supply of that good (including resource availability, competing demands for those resources, and production costs). Prices in a free market can be thought of as signals transmitting information to both buyers and sellers of goods. The prices also provide a strong incentive for individuals to act on that information. Since all individuals and organizations have limited resources and face budget constraints, higher prices are an incentive to use less of relatively costly goods.

In a classic discussion of the price system, F. A. Hayek (1945) uses the example of a rise in the price of tin. The price increase could result from two different scenarios, a new economic use of tin or a temporary reduction in the physical supply of tin. Existing users of tin will see the price increase and voluntarily cut back on their use of tin by producing less of their product or switching to a substitute. The existing users do not need to know why the price increased (and Hayek emphasizes that this fact is crucial), because they have the information that tin is now more economically scarce and they have an incentive to use less tin since their costs have increased.

A second characteristic of the free market follows from the existence of prices: the profit and loss

system. Individuals making decisions in a free market must monitor both the price of the inputs they purchase (their costs) and the price of the outputs they sell (their revenues). In simple accounting terms, if revenues exceed costs, the individual will receive a profit. If the reverse is true, the individual will suffer a loss. This simple accounting formula has important implications for a free market system. Profits provide a signal that an individual has created value: the market value of the resources created is greater than the resources destroyed. Profit provides a signal for the individual to continue in this line of work and to continue to control the labor and capital as before (the opposite is true for losses).

Two important ideas for understanding the free market system are voluntary exchange and the invisible hand. *Voluntary exchange* is the act of sellers and buyers in a market willingly engaging in transactions with one another. Not only are they free from coercion, but they are also acting in a mutually beneficial way. It is rare for a buyer or seller to be in a worse situation after a transaction than before, because individuals are generally good at assessing how much they value particular goods. All transactions take place at the will of the buyer and seller, and never (legally) will a transaction be forced upon either.

An early explanation of the *invisible hand* was made by Adam Smith (1776). The term describes how the actions of individuals in a free market system are guided by an “invisible hand” as opposed to being guided by conscious direction from government or any other organization. Individuals are guided to help others by, somewhat paradoxically, pursuing their own interest rather than directly trying to assist others. The existence of prices and potential profits are the crucial mechanisms that allow for the beneficial operation of the invisible hand. More literally put, the invisible hand means a free market system is in many ways self-regulating. And most importantly, when individuals are pursuing their private interest, they are guided by the invisible hand to serve the public interest.

Not only is a free market system important to individual countries, but it also plays a vital role in the ever-growing pattern of globalization across the world. More and more, prices no longer convey information just to the producers and consumers within a specific country but also individuals participating in different economies all over the

world. With each passing day the economies of almost all countries become more interdependent and with this they are more subject to the actions of others. It is important to maintain strong economic incentives and keep the flow of information unrestricted in order to complement this ongoing globalization.

Free Markets in Practice

As stated above, no country has ever used a completely free market system. But which countries adhere most closely to this ideal? Prior to the collapse of the Soviet Union and its satellites around 1990, the world could be neatly divided into free market and planned economies (though there was still much variation within these two categories). Today, with a few notable exceptions (North Korea and Cuba), all countries embrace the free market, at least in their rhetoric. But some countries embrace the free market both in speech and in action more strongly.

Recently, several quantitative indexes have been developed to measure the degree to which countries adhere to the free market. The most widely used are the Economic Freedom of the World Index (developed by the Fraser Institute in Canada) and the Index of Economic Freedom (developed by the Heritage Foundation). These indexes aggregate various measures of economic freedom developed by third party sources, such as the World Bank and World Economic Forum.

The Fraser Institute’s Index uses 42 sources of data to create 5 broader categories of economic freedom: size of government; legal structure and property rights; sound money; free international trade; and regulation of credit, labor, and business. Using this data, they give countries a score on a 10-point scale and rank the countries. Of the 141 countries for which they had data in 2009, the Fraser Institute ranks Hong Kong, Singapore, and New Zealand as the closest to a free market system (with scores of 8 or 9 out of 10). At the bottom of the list are countries such as Zimbabwe, Myanmar, and Venezuela (with scores around 4).

In both economic freedom indexes, the United States is in 10th place, a very strong score but definitely not the freest in the world. This is a divergence from the rhetoric of U.S. politicians, the perception of U.S. citizens, and the rest of the world. Countries

such as Australia, Switzerland, and Canada also rank above the United States. The United States' score and ranking have exhibited two distinct trends in the past few decades: a steady increase in economic freedom from 1980 to 2000 and steady decrease from 2000 to 2009. This trend will likely continue through the next few years as data are finalized.

The extent to which a country uses the free market as its economic system is a strong predictor of how prosperous and well-off that country's citizens are. The most obvious correlation between free markets and prosperity is the average income of a country. The Fraser Institute divides the countries of the world into four groups from most to least economically free. The freest quarter of countries have an average income of about \$31,500, more than double the next group of countries (about \$15,000) and about seven times greater than the least free countries (about \$4,500).

Free markets do not just help the average person in a country, but the least well-off as well: the poorest 10% of the population in the most free-market group of countries have incomes that are more than double the next quarter of countries and over eight times more than the least free countries. Free markets do not just produce more wealth but also more health: in the freest quarter of countries life expectancy is about 19 years longer than the least free. These correlations hold for almost every measure of well-being that economists are able to quantify.

It is unlikely that the entire world will fully embrace the free market any time soon. However, the evidence shows that movement in the direction of a free market system leads to better living standards for citizens living in those countries.

FREE SPEECH

In a monograph on public relations law, Frank Walsh (1988) wrote,

Democracy is fundamental to the potential of public relations. In the United States, the democratic process rests on the Constitution. Public relations without constitutionally protected free press and free speech is a misnomer. Without exception, every area of public relations practice involves legal rights and restrictions. (p. 1)

The basis of the protection is the First Amendment to the Constitution, which reads, in part, “Congress shall make no law . . . abridging the freedom of speech, or of the press.” In addition to the federal constitution, freedom of speech is also protected by state constitutions, statutes, and the common law.

Although the First Amendment is phrased in absolute terms, it has never been applied as an absolute principle. For example, national security issues, fighting words, and legally obscene materials have been viewed as outside First Amendment protection. Areas that impact public relations, such as defamation, copyright protection, and privacy issues, set up conflicts between free speech rights and other protected values.

A number of commentators and textbooks have adopted the justifications for the choice enunciated by Thomas Emerson. According to Emerson (1970), there are four justifications for guaranteeing free speech. First, “freedom of expression is essential as a means of assuring individual self-fulfillment.” Second, “freedom of expression is an essential process for advancing knowledge and discovering truth.” Third, “freedom of expression is essential to provide for participation in decision making by all members of society.” Fourth, “freedom of expression is a method of achieving a more adaptable and

hence a more stable community” (pp. 6–9). Thus free speech is justified both as an individual good and as a good for society—both as an ends and a means. All four justifications find expression in various Supreme Court decisions.

Although Emerson focused his analysis primarily on the American experience and Supreme Court decisions, the justification of freedom of expression has a long philosophical history, dating back at least to the arguments in John Milton’s *Areopagitica* (1644) and advanced in John Stuart Mill’s *On Liberty* (1859). Although both Milton and Mill make a number of detailed arguments against censorship in favor of free speech, they can be reduced to two main arguments. The first is that the way to combat speech that is harmful is not to censor it but to counter with more speech. Censorship is never effective, leads to loss of mental toughness, and promotes conformity. More speech leads to public discussion, a greater possibility of resolving issues, and a greater chance that truth will emerge. The second argument is based on the idea of individual competence and responsibility. The basis of the arguments is that individuals are the best judges of what is in their best interest and that they are responsible enough, if persuaded or outvoted, to set that individual interest aside in favor of the common good.

But what does a guarantee of free speech mean? One of the first cases dealing with the issue was *Near v. Minnesota*, 283 U.S. 697 (1931). Chief Justice Hughes (1931), writing for the majority, referenced William Blackstone’s (the 18th-century English judicial scholar) statement:

Liberty of the press . . . consists in laying no previous restraints upon publications, and not in freedom from censure for criminal matter when published. Every freeman has an undoubted right to lay what sentiments he pleases before the public; to forbid this, is to destroy the freedom of the press. (pp. 713–714)

Although this statement was criticized from both directions—that some limited areas could be subjected to prior restraints and that liberty of the press that was not guaranteed in nonharmless statements could be subjected to criminal prosecution—the statement became the basis for the idea that freedom of speech consisted in no prior restraints on communication.

As a corollary, freedom of speech entails the means to gather information from willing participants and from governmental sources via sunshine laws and freedom of information statutes. Another corollary necessary to freedom of speech is the right to distribute the message. This right has been sustained by the courts in various contexts, including public forums, mail, door-to-door situations, and the media. Some distribution methods have come under scrutiny, including computer spam, telemarketing, and unsolicited faxes.

Although there is a strong presumption against prior restraints on expression, a distinction is often drawn between expression and action. Expression is strongly protected, but action is not protected at the same level of scrutiny. The key is how to draw a distinction between the two. Courts have wrestled with drawing this distinction in such areas as mass picketing and various forms of symbolic speech. A distinction is also drawn between anti-speech and nonspeech regulations. For example, a tax on the media may impact expression, but if the media are treated as any other business, the tax is considered a nonspeech regulation and upheld. Restrictions regarding the time, manner, and place of expression are also routinely upheld as long as they are content neutral, there is little discretionary power in the hands of the administrators, they are reasonable, and they advance a legitimate governmental interest. Captive audiences are generally given greater protection by the courts than are other types of audiences.

On balance, Western democracies have chosen to place minimal legal restrictions on communication, preferring to rely instead on a sense of responsibility and relevant ethical standards and codes of conduct. That choice seems to have had positive results for the field of public relations.

FREELANCE WRITERS

A freelance writer earns a living by writing or editing, taking photographs, or preparing graphics for broadcast stations, magazines, websites, newspapers, corporations, individuals, nonprofit organizations, and anyone else who needs help collecting, packaging, and disseminating information.

Public relations agencies and departments typically use freelance writers to work on special projects that the existing staff does not have the time or the expertise to handle. A freelance writer might be hired to prepare or edit an employee handbook or to develop interesting and enlightening graphics for an annual report.

The main advantage of hiring freelance writers is monetary: It costs less to hire someone on a one-time basis to complete a single project than it does to retain someone on staff to handle that job. A corporation or nonprofit organization typically does not have to worry about providing to freelance writers health insurance or retirement benefits since they are not employees.

Another advantage is that an organization can keep abreast of some of the latest developments in a field. A CEO who wants to add streaming video to the organization's website might have no idea how to do that—and might have no employee who can do that. Enter a freelance writer to show how it's done.

A disadvantage of using freelance writers lies in the lack of continuity. They seldom know the organization well, and they might not care too much about its overall health. The commitment is not there to learn the organization's history, values, culture, or policies. This lack of knowledge can lead to embarrassment or to a product or service that is less useful, impressive, or compelling than it might be.

A related disadvantage is the potential lack of control over a freelance writer's work. Robin Gregg sold the *New York Post* a story (about Walmart stores dropping Kathie Lee Gifford's clothing line) that looked a good deal like a story in the *National Enquirer*. Gregg will never write for the *Post* again, according to the *Post*'s management, but the damage was done. This was not a public relations firm, but the same thing can happen in almost any media context.

Freelance writing can be viewed from an entirely different perspective: A public relations writer can be seen as a kind of freelance writer when he or she contributes material to a medium. The obvious example is the news release. Practitioners are not paid for the releases they send, but the process is the same. The practitioner, in effect, works for the television station, for example, supplying material that might be aired. It's important for the practitioner to thoroughly understand the medium and its audience, the prevailing writing style of that medium, and the length and tenor of stories accepted. The practitioner who does these things will be a successful "freelance writer."

FRONT GROUPS

Third party groups, coalitions, special interest groups, and trade associations formed and structured to advocate an explicit policy interest have become part of the U.S. political and economic landscape. Such groups derive their power from their size (individuals or groups represented) and the credibility attached to those numbers and the ethical standing of those who comprise the coalition. Their power depends on their ability to pressure policy makers and affect discourse and behavioral outcomes related to public policy decisions.

A 20th-century outgrowth of these organizations is the controversial tool called *front groups*. These groups involve deliberate financial, source, membership, and informational misrepresentations designed to persuade in a purportedly open communication context where interests are at stake for the advantage of undisclosed special interest or commercial purpose. They may be transient, reflecting their often single-issue focus. According to Kathy Fitzpatrick and Michael J. Palenchar (2006), front groups are a controversial public relations techniques used by organizations

to influence public opinion and public policy on behalf of undisclosed special interests. The groups are created to pursue public policy objectives for organizations that disguise their connection (e.g., financial support) with the effort while attempting to appear independent. The typical objective of front groups is to convince public policy makers that citizen support skews in a particular direction or to influence outcomes in local, state, and national elections. (p. 203)

Many front groups operate out of public relations agencies whose employees act as directors and managers and even the membership of the group. Front groups usually are given high-values laden, noble-sounding names such as “Citizens for [Something Good].” Other tactics include use of scientific sounding names such as the Council for Agricultural Science and Technology or names that suggest a concern for the public interest such as the National Wetlands Coalition. Michael Pfau, Michel M. Haigh, Jeanetta Sims and Shelley Wigley (2007) used the term *front-group stealth campaigns* to describe this public relations endeavor.

Modern history of front groups suggests that use of deceptive third-party techniques was initiated by Edward Bernays and advanced by Carl Byoir. For example, Byoir’s firm created a front group called the Pennsylvania State Association of Township Supervisors that helped lead to the veto of some trucking legislations (Cutlip, 1994). Although corporations are the most frequent targets of criticism, religious and other nonprofit organizations also use front groups.

Public Relations Society of America (PRSA) code addresses the use of front groups under a provision that outlines what members shall do: “reveal the sponsors for causes and interests represented” and “avoid deceptive practices” (2000). In August 2004, PRSA issued Professional Standards Advisory PS-3 entitled *Front Groups*: “Members should recognize that assisting front groups that represent undisclosed sponsorships and/or deceptive or misleading descriptions of goals, causes, tactics, sponsors or participants constitutes improper conduct under the PRSA Member Code of Ethics and should be avoided” (p. 2).

FULLY FUNCTIONING SOCIETY THEORY

Fully functioning society theory (FFST) of public relations reasons that for organizations to be successful they need to contribute to society, its dialogue quality, its sense of community, the quality of its structures and functions for collaborative decision making, the cocreation of meaning, and the alignment of interests. Fully functioning society theory reasons that public relations theory is best when it challenges and helps organizations be effective not only by what they do for themselves but also with the communities where they operate and on whose resources they depend.

As well as featuring the quality of processes needed for public relations success on behalf of organizations and community, public relations theory must realize that ideas and meaning count as communities solve problems and make collective decisions. Consequently, the theory features the role of infrastructures (process-based systems, structures, functions, and institutions) and meaning, which results from as well as shapes the nature and quality of discourse: deliberative democracy and stakeholder participation.

The tradition of public relations research and theory, as well as best practices, has at various times developed with the narrow purpose of helping organizations to be effective and able to achieve their missions and visions. This is an agentic approach to organizational management, especially through theories such as institutional theory. Taking a broader view, FFST presumes, fundamentally, that no organization can long be successful if it places its interests above those of the community(ies) where it operates. As such, this theory emphasizes the inherent connection of management, operations, discursive communication, critical ethical choices, and community. It rests on timeless assumptions about the rhetorical heritage and more modern concerns about discourse quality. It features the importance of aligning interests through deliberative democracy and stakeholder participation.

Resting upon several premises, the theory was developed in response to many pressures, one of which was the challenge offered by Bruce K. Berger (2005):

There is little doubt that public relations has effectively served capitalism and powerful economic producers for many years, but whether it has served or can serve stakeholders and society as well from inside or outside the dominant coalition is a contested issue. (p. 6)

By issuing that challenge, Berger focused on the problematics of public relations research and practice narrowly devoted to the agency of organizations, perhaps at the expense of or with indifference toward the larger community that in various ways enfranchises organizations to operate—as servants of society.

To dig into ways for public relations to help make society more fully functioning, Robert L. Heath (2006) offered several premises to guide public relations research and practice. The first premise challenged managements to demonstrate the ability to be reflective in ways that foster their legitimacy, being collaborative, proactive and responsive to others' views, interests, and needs. The challenge was to be a genuinely good corporate citizen as the first step toward being effective both through operations and communication with others.

The second premise featured the need for organizations to be willing and able to understand and

achieve standards of corporate responsibility that make them legitimate brokers of community resources. The assumption of this principle is that ethical standards of operation reflect norms of society that are collaboratively shaped, not manufactured by organizations to justify their management plans.

The third premise focuses on the paradoxes of power, which have implications for the right and ability to influence outcomes, including processes, operations, and perhaps more importantly, the ideology that justifies or denies power resource management. One of the paradoxes of power resource management is the normative nature of western management philosophy, which traditionally seeks to bend society to the interest of organizations and organizational leaderships. In that effort, discourse can either feature narrowly the interests of the organization or those of the community. This premise asks whether power is an individual, organizational agency or the collaborative property of the community.

Rather than denying the role of interests, or asking organizations and individuals to set them aside, the theory offers the fourth premise, which features the community as conflicting and conjoined interests and expectations. Self-interests motivate, but they also collide. The challenge is to align and meld them into a coherent whole that can add value to all interests that are legitimate to the integrity of the community. As such, the theory poses the idea that societies organize for the collective management of risks. Those who do the best to collectively manage risks in collective interest do better than those who shift risk bearing disproportionately on some to the advantage of others. Thus, the theory postulates the virtue of collectively advancing interests through effective risk management as a key public relations role and responsibility.

That line of reasoning sets the foundation for the fifth premise, which pits corporatas against *communitas*. Are relationships and other conditions for a fully functioning society bent to the benefits of some at the dysfunction and marginalization of others? Or is the collective incentive to foster mutual benefit? In that latter condition, stakes are exchanged for the good of the whole community. Both in management and communication, *communitas* rests on the rationale of openness, trustworthiness, cooperation, aligned interests, compatible

views/opinions/norms, and commitment inspired through cocreated meaning.

Robert L. Heath's 2006 article in the *Journal of Public Relations Research* states that the sixth premise builds on the previous five:

Society is a complex of collectivities engaged in variously constructive dialogue and power resource distribution through meeting socially constructed and shared norm-based expectation whereby individuals seek to make enlightened choices in the face of risk, uncertainty, and reward/cost ambiguity. (p. 108)

This premise lays the foundation for the seventh premise, which emphasizes the importance of responsible advocacy, and the eighth premise, the virtue of narratives and other rhetorical forms used to coconstruct enlightened choice.

The rhetorical heritage with all of the advantages and disadvantages of discourse is presumed to be capable, but not without constant monitoring, of being a means by which people collectively achieve enlightened choices and shared commitment. That is the outcome and by implications the challenge of responsible advocacy, which presumes that in the marketplace wrangle of ideas better ideas drive away bad ones.

As matters often do, FFST features some prepositions, namely *between* and *with* rather than *for*. *Between* presumes the virtue and pragmatism of emphasizing collectivity over individuality, cooperation rather than victory or defeat. An elitist (paternalistic) ideal presumes that corporate managements have better problem-solving skills than do individuals. Therefore, the elitist role (corporatas) of public relations can be conceptualized as showing stakeholders the dysfunctions of their decision making. That view of public relations contrasts with one that presumes a less western managerial approach, one more dependent on the quality of the rapport and engagement potentialities of working together for common ground.

Such a view of public relations, however, should not discount the need for and role of corporate citizenship, which presumes that large organizations often need to help create and improve infrastructures that empower stakeholder discussions. Infrastructures can, and often do, privilege some interests. Lobbying is an excellent

example. It can be used in ways that benefit some interests against others. Fully functioning society theory challenges senior practitioners to help design and empower forums in which productive discussions can transpire to produce collaboration. Thus, both the rhetorical heritage and critical discourse advocates know that the quality of ideas generated is never greater than the quality of the arena in which they are forged. Systems, structures, and functions count; they are the process and place of discourse. Access to and influence over the process is an individual and collective power resource.

For many years, discourse analysis and the rhetorical heritage have sought to critique and guide the quality of discourse. Meaning matters. That is not only a key to community productivity, agency, but it also sees public relations as much more than mere wordsmithing. Public relations continues to be a language function, one where expertise is devoted to crafting effective messages that shape individual and collective decision making. Beyond a tool, language, meaning, and the quality of community decision making are discursive challenges. Language is not narrowly a tool of clarity. It is a tool of power, preference, and privilege.

How meaning is shaped and the meaning that is shaped have implications for cognitive processes of mind as ideation, self/identity, and society/relational. Each of these molar concepts presumes an important dimension where the power of vocabulary shapes how people think, what they think about, the conclusions they draw, the sense they have of themselves and others, and the conceptions of relationships and society. As such, meaning is a primary power resource.

Fully functioning society theory adopts themes of stakeholder participation and deliberative democracy as hallmarks of robust discussion about the nature and rationale for the public relations practice as either harming or helping collective interests.

FUNCTIONS OF PUBLIC RELATIONS

During the 20th century, public relations steadily evolved into a structured professional practice based on the development and refinement of specializations. Today, we think of these specialties as functions. A *function* is a unique service, program, department, or job title; conceptualized through the logic of social science, a function is an independent variable that can produce specific outcomes (dependent variable) in contexts. As such, one such function, lobbying, is applied in the context of government relations, which itself is a specialty function, either of organizations or agencies.

Each function has its unique set of objectives; broadly, these are used to build, maintain, and repair relationships with specific markets, audiences, or publics. Typical functions include media relations, corporate communication, investor relations, issues management, community relations, employee relations, donor relations, strategic philanthropy, and government relations. How these are named, used, and organized depends on the management of each organization.

An organization may place public relations functions under the marketing function, such as publicity, promotion, integrated communication, integrated marketing communication, and marketing communication. Each function has the sense of being a specialty under the broad umbrella of departments with titles such as *public relations* or *public affairs*, or the functions may be positioned to support some other department such as marketing.

As a specialty activity, each function is developed because of the dynamics and challenges unique to each organization and its mission, vision, and culture. In contrast to organizations that have their own public relations functions, each agency is likely to position itself as specializing in key functions, or it may present itself as a full-service agency. By implication, a full-service agency can provide and support all functions. Agencies often find it makes sound business sense to specialize in one or a narrow cluster of functions that give it the opportunity to maximize its client service. The challenge of the professional personnel who work in support of each function is to provide their own unique strategic and tactical service—whether to their employer or as an agency bringing their resources to bear on clients' needs.

As organized into a company (or other organization) or agency, each function may have specialty personnel and a dedicated budget. For instance, a large corporation may decide to have a strategic philanthropy function that is dedicated to issuing invitations for proposals for funding out of the corporate philanthropy pot of money—the money senior management dedicates to building community goodwill by funding nonprofit organizations. This function is likely to review the applicants to determine which are worthy and to also search for and investigate worthy groups that should be given funding as part of the company's strategic philanthropy.

The specific functions an organization employs or the specialties that are offered by each agency are positioned in response to unique dynamics of the environment where they operate. Some functions are a direct result of external requirements. Perhaps the most obvious of these is investor relations. Publicly traded companies are required by the Securities and Exchange Commission (SEC) to communicate with current or potential shareholders in a timely, public fashion so that investors can obtain the information they might want to make decisions to buy, sell, or hold shares of the company's stock. This function is generically called "investor relations." Some agencies specialize in investor relations, because it requires unique knowledge of SEC regulations and must meet highly regulated challenges. This function requires careful coordination with legal and financial expertise relevant to the securities marketplace. Some

agencies make no pretense of offering investor relations services because of the special requirements of that function.

Thinking about investor relations, for instance, brings up another point relevant to the discussion of functions. Some of the traditional functions are located within public relations or public affairs departments, whereas others bridge several departments. In many companies, for instance, corporate or employee communications is likely to bridge between and call on specialists from public relations/public affairs and human resources. In some instances, a function typical of public relations may be located in another department. Over the years, for instance, many investor relations functions have left the shelter of public relations departments to become subsumed under the corporate general counsel or the chief financial officer (CFO).

The function called government relations might also bridge two or more departments. For instance, it might have its primary location in public relations/public affairs. Because of the unique nature of the company, it might link to the company's general counsel (bearing on the legal concerns and expertise of the organization) as well as link to operations under the chief operating officer. Depending on the challenges unique to the company, government relations might need to be matrixed with human resources, engineering, production, and marketing. In this configuration, the service of public relations to the marketing effort is not to sell products or services but to link that department with the legislative and regulatory arena. Government relations, for instance, might need to gear up to monitor legislative and regulatory issues that could influence how the organization markets its products and services. The government relations function might need to support, mitigate, or oppose legislation or regulation that can affect how the organization markets its products or services.

How each company selects, organizes, charges, and budgets its functions depends on its culture, its mission or vision, and its location in the marketplace or public policy arena. For instance, companies that are largely devoted to selling consumer products are likely to have a marketing bias in their culture, planning, and operations. They are so devoted to marketing that advertising and public relations tend to be located under the marketing department or may even report to a chief marketing officer or a senior

vice president of marketing. In such companies, advertising and public relations work together to sell products or services. There public relations may be limited to a publicity and promotion function. In such situations, it is not surprising to find investor relations and government relations functions located in departments totally separate from public relations. The same may be true of strategic philanthropy and employee relations. In such an organization, the community relations function may very well be devoted to events that publicize and promote products rather than address other concerns relevant to the locales where the company operates.

One reason that public affairs developed as a title for the primary public relations program in large companies was the desire and need by such companies to deal with publics that were not markets or audiences. For this reason, those companies developed a sense of public relations functions that focused more on stakeholder relations than on marketing. Thus, an industrial manufacturing company—such as one dedicated to the steel industry, the chemical manufacturing industry, or the timber industry—might have a public affairs department. It might have a public relations (promotion and publicity) function under public affairs; in this configuration the work assigned to public relations is likely to be limited to marketing support. Or public relations (promotion and publicity) might be located beneath the chief marketing officer, whereas public affairs might have its own chief, for instance, a chief communication officer (CCO)—or the parallel might be the vice president of public affairs on the same organizational line as the vice president of marketing. In one more variation of this theme, the company may have marketing, advertising, and public relations all located beneath the CCO or vice president of public affairs. Large manufacturing organizations that are vertically and horizontally integrated may have public relations or public affairs located in each major operating division. Some divisions may use public relations in support of marketing, whereas other divisions of the company may use public relations primarily for governmental relations, community relations, and strategic philanthropy.

The theme that runs through the definition and design of functions, then, is that the functional location and the specific functions under public

relations are selected and budgeted to be relevant to the challenges that drive the organization's mission or vision, strategic business planning, management, and stakeholder relations. Agencies also position themselves competitively. To do so, they determine what functions to offer as part of the kinds of business they want. Positioning through functions is necessary for agencies to generate revenue in a highly competitive market. For instance, some agencies are closely associated with advertising agencies, or they may be owned as departments in advertising agencies—or marketing agencies. Some agencies are marketing communication specialists that even have advertising, graphics services, and events planning and execution.

In contrast, other agencies feature specialties less directly related to marketing. They all will have a media relations function. In addition, they might specialize or offer a specialty in community relations, government relations, risk communication, issues management, strategic philanthropy, investor relations, or crisis communication.

Functions are not unique to businesses or agencies. Nonprofit organizations will have various functions given their mission. For instance, a museum is likely to have a development, marketing, and publicity function—or separate functions depending on size and budget. A museum might have an educational outreach function, linking it to schools. That might be a part of its community relations function. Educational outreach is often seen as a part of its marketing and development function.

Universities and colleges have marketing, public relations/public affairs, and alumni relations departments. They will have functions: government relations, alumni relations, development, publicity, faculty relations, employee relations, student relations, parent relations, and such. The logic for each college or university may differ because of its mission and vision, but each will have functional divisions and specialties.

Agencies become complementary mirrors of the organizations they strive to serve by adding value to functions in the client organization or by offering functions the client does not have. Sometimes, the role of the agency is to provide a function that a client cannot afford. For instance, if an organization does one major event per year, it might be cost-effective to outsource that function rather

than to have people devoted to events or to assume that people doing other public relations functions can also do events. Shipping companies may periodically need a crisis response, but they may find it is more cost-effective to have a specialty agency on retainer than to have an in-house crisis response function. Having said that, however, practitioners in nonprofit organizations are more likely to be Jacks-and-Jills-of-all-trades simply because they have fewer resources to spread across their functional needs.

One of the functions of public relations, counseling, is the most controversial and demanding. Some agencies—often limited in size, but not expertise—specialize as counselors. They may draw on years of experience and conduct various kinds of research to help the organization solve a problem relevant to its positioning—relevant to various functions. In this sense, counseling might relate to refining the mission and position and even address strategic business planning to better increase revenue and reduce the costs incurred through collisions with activists and other critics. Counseling can also be one of the internal functions that either senior members of the public relations department or specialized members of the department can provide to others in the senior management team. Departments with an issues management culture have counseling built in. They traditionally assess, for instance, organizational ethics and standards of corporate responsibility.

New media, especially social media, offer new and challenging functional opportunities for organizations and agencies. Companies with high marketing and customer satisfaction expectations may hire specialists to monitor and respond to customer comments. Agencies offer specialized services, including monitoring and tracking comments relevant to a company, service, product, and such. At the moment, this is a very fluid function as practitioners learn the new media terrain.

FUNDRAISING

Fundraising is one of public relations' highest paid specializations and one of the least understood. Practitioners manage relationships between one special type of organization and one special stakeholder group: charitable organizations and their donor publics. Contrary to popular belief, the purpose of fundraising is not to raise money, but to help organizations and donors fulfill mutual philanthropic interests.

A good analogy for understanding fundraising, which also is known as *development* and can be termed *donor relations*, is investor relations. Practitioners specializing in investor relations are high paid. They manage relationships between publicly owned corporations (one special type of organization) and investors, or current and potential stockholders (one special stakeholder group). Investor relations specialists do not sell stock in the corporation to generate revenue; rather, their job is to help the corporation retain and attract owners, who invest in the stock market to advance their financial interests. The two parties are interdependent; each needs the other to achieve its goals. Investors are both organizations and individuals, some of whom make major financial commitments and, by virtue of the large percentage of shares they own, hold a great deal of power in the organization–public relationship. Other investors buy only a few shares of stock and have little power individually, although their collective power is substantial. Investor relations specialists use a variety of communication tactics—from interpersonal to controlled media to mass media communication—to build and maintain these relationships.

Just as participation in the stock market is a characteristic of our capitalistic economy, America's tradition of philanthropy pervades our society. Quite simply, donors give money to charitable organizations not because fundraisers persuade them to give, but because giving is a customary, expected, admired, and even legally required behavior in the United States. The job of fundraisers is to retain and attract donors, who traditionally give away money to advance causes that they believe will improve society. Indeed, philanthropy and its facilitation by fundraisers are essential to what is referred to as *social capital*, which is the bedrock of civil society.

Historical and Organizational Context

Fundraising traces its beginning to the founding of the colonies that became the United States. Discussions of its history usually start with the first solicitation for Harvard College in 1641, which produced the colonies' first public relations brochure. Fundraising was conducted haphazardly by volunteers and untrained managers until the early 1900s, when specialists began to emerge. Institutionalization of the function dates back to just 60 years ago. Although fundraising has spread to almost all countries, its roots are in American democracy, which promotes a nonprofit sector and fosters philanthropy through a favorable tax system.

Fundraisers work for charitable organizations, a special type of nonprofit organization. They should not be confused with people who carry out fundraising activities for other types of nonprofit organizations, such as political parties or electoral campaign committees. The term *fundraising* generally is reserved for bringing about *philanthropic* exchanges, meaning that the transfer of money is not based on quid pro quo (as it is in a marketing exchange) and that the money given meets the criteria of a charitable contribution, as defined by the Internal Revenue Code.

The nonprofit sector consists of tax-exempt organizations that are neither businesses nor government agencies. There are approximately 1.6 million U.S. nonprofit organizations, of which more than 1 million, or 68%, are charitable nonprofit organizations, meaning that gifts to them are deductible from donors' taxable income. Charitable nonprofit

organizations come in all shapes and sizes, from local day-care centers and neighborhood churches to major research universities and metropolitan hospitals. Their missions, or the purpose for which they were granted tax exemption, are diverse and represent all aspects of society, including the arts, education, the environment, health, human services, and religion.

The majority of charitable organizations have annual revenues of less than \$100,000 and depend on volunteers, such as trustees, to raise philanthropic gifts. Charitable organizations with higher revenues—often millions or even billions of dollars per year—employ fundraisers, either as external consultants or as internal staff. Although no official count exists, projections based on earlier estimates place the number of full-time fundraisers at approximately 150,000.

Donor Publics

As with investors, donors consist of both organizations and individuals. Similarly, some donors make major gifts and hold a great deal of power in the organization–public relationship, whereas others make small annual gifts and hold little power unless they act collectively. The relationship is based on interdependency between the donor, who provides financial resources to carry out the charitable organization’s mission, and the charitable organization, which provides the means to carry out the donor’s philanthropic wishes.

There basically are three donor publics: individuals, foundations, and corporations. Individuals traditionally give more than 80% of all gift dollars every year. The amount of dollars given by all donors to all charitable organizations in the United States is quite impressive. It also is the envy of all other industrialized countries. For example, in 2011, Americans gave a total of \$298 billion, of which 81% came from individuals, 14% came from foundations, and 5% came from corporations, according to Giving USA (2012).

Philanthropy by all types of donor publics, according to philanthropy and nonprofit management scholars, is best explained by the mixed-motive model of giving, which holds that philanthropy reflects neither pure altruism nor pure egoism; it involves mixed motives: to fulfill the donor’s interests in self and in a common

good, as represented by the mission of the charitable organization receiving the gift.

Furthermore, the American tradition of philanthropy creates an expectation that all individuals should make charitable contributions, according to their means. Wealthy individuals are held to a philanthropic standard that is unusual in the modern world: They are expected to give away most of their wealth before or at the time of their death. The standard was outlined in the late 1880s by legendary philanthropist Andrew Carnegie, who proclaimed, “He who dies rich dies disgraced” (1983, p. 108).

Corporations that give away pretax dollars are admired. Philanthropy is a critical element in demonstrating corporate social responsibility. The theory of corporate contributions as social currency holds that U.S. companies make gifts because senior managers are expected by their peers to contribute corporate dollars. Studies have shown that giving is the norm in many business subcultures, and managers who want to remain in the inner circles have to conform by making appropriate contributions. Finally, foundations, unlike the other donor publics, are required by law to give away each year an amount equal to 5% of their financial assets. Their very purpose is to provide support to charitable organizations through grants. The number of U.S. foundations has increased rapidly during the last two decades and now totals more than 76,600.

Programs

Fundraisers organize their activities into four traditional programs: annual giving, major gifts, planned giving, and capital campaigns. The first two are primary programs; the second two actually are strategies to raise major gifts.

Focusing on the primary programs, annual giving raises lower-level gifts, whereas the major gifts program raises major gifts. Dollar amounts defining the two gift types differ among organizations. For example, universities and hospitals typically define a major gift as a gift of \$100,000 or more, but most churches and human services organizations (such as chapters of the American Red Cross) use \$10,000 as the dividing point. Contributions and grants from corporations and foundations, respectively, usually are major gifts. Gifts from

individuals run the gamut—from pennies placed in collection plates to multimillion-dollar pledges. Most Americans make at least one annual gift each year, but because wealth is not distributed equally in the U.S. capitalistic economy, a minority of individuals—those with the most income and assets—account for most major gifts.

Annual giving often is described as the bread-and-butter program of fundraising because it generates annual income that helps pay the charitable organization's operational expenses. Annual gifts, which typically are less than \$100, almost always are unrestricted in purpose, meaning they can be used where most needed as determined by the organization's managers after receipt. In contrast, major gifts almost always are restricted and must be used for the specific purposes for which they were given, determined in advance of receipt. Annual gifts usually are made from donors' income, whereas outright major gifts are made from donors' income and assets, and planned major gifts typically come only from donors' assets. As operational expenses are reoccurring, the annual giving program is repeated each year, unlike the major gifts program and planned giving, which are ongoing, and capital campaigns, which are sporadic.

For most charitable organizations, the major gifts program accounts for the vast majority of dollars raised, and only a relatively few gifts account for most of that money. Approximately 80% of all dollars raised will come from 20% of all gifts—what fundraisers refer to as the *principle of proportionate giving*. The major gifts program, therefore, is targeted at wealthy individuals, as well as corporations and foundations—but only those that have an expressed interest in the organization and its mission. Virtually every major donor has a long-standing, carefully nurtured relationship with the recipient organization and the people who represent it. In almost all cases, major donors have made previous gifts to the organization. Because they provide most of the dollars raised, major donors have considerable power in affecting the organization's operations—similar to the power held by large institutional investors in publicly owned corporations. Fundraisers seek a balance between protecting organizational autonomy and being accountable to major donors. To help them

achieve balance in their boundary role, fundraisers must be skilled negotiators because major gifts usually are restricted—often with multiple conditions—for purposes that may or may not coincide with the organization's self-directed plans.

Colleges, universities, and hospitals attract the largest gifts, followed by arts, culture, and humanities organizations. In 2011, for example, organizations with education and health missions raised \$39 billion and \$25 billion, respectively, according to Giving USA (2012). Not surprisingly, colleges, universities, and hospitals employ the largest number of fundraisers.

To raise annual gifts, fundraisers primarily use controlled media tactics, specifically, direct mail and special events, to solicit lower-level gifts from a large numbers of individuals. In contrast, fundraisers primarily use interpersonal communication tactics such as face-to-face conversations and personal letters to solicit major gifts from a much smaller number of individuals, corporations, and foundations. Fundraisers increasingly are using Internet channels such as websites and social media to cultivate donors and solicit gifts. Building and maintaining relationships with donors is key to both primary programs, which requires fundraisers to devote a great deal of their time to sharing information and encouraging involvement. The emphasis of their work is on research, cultivation, and stewardship—not solicitation.

ROPES Process

The ROPES process model, drawn from public relations theory, was conceptualized to describe how fundraising is conducted and was tested in field research by Kathleen S. Kelly. Kelly then applied the resulting model to overall public relations practice, which affirmed the common theoretical basis of fundraising and public relations.

ROPES consists of five consecutive steps: research, objectives, programming, evaluation, and stewardship. Fundraising begins with research in three progressive areas: (a) the charitable organization for which practitioners work; (b) the opportunity, or problem, faced by the organization; and (c) the donor publics related to both the organization and the opportunity. The second step is setting specific, measurable objectives that are

derived from organizational goals and supported by research. Objectives are not limited to dollar totals. Programming consists of planning and implementing activities designed to bring about the outcomes stated in the objectives. These activities are categorized by the two purposes of cultivation and solicitation. Evaluation monitors programming and later determines if the set objectives were met. Stewardship completes the process and provides an essential loop back to the beginning of fundraising. Four sequential elements are basic to stewardship: reciprocity, responsibility (including responsible gift use), reporting, and relationship nurturing.

Research is deemed the most important step in fundraising, followed by stewardship. The

prioritization is logical in that scholarly and practitioner analyses show that donors decide which causes are important to them and that the best prospects for future gifts are current donors. Whether raising annual, major, planned, or campaign gifts, the ROPES theory holds that fundraisers should spend 20% of their time on research, 15% on objectives, 30% on programming (equally divided between planning and implementing), 15% on evaluation, and 20% on stewardship (see Figure 1). Results of field research show that fundraisers generally follow the ROPES process, although they devote less time to research than advocated by the theory.

Fundraising lags about four decades behind public relations in establishing itself as a profession.

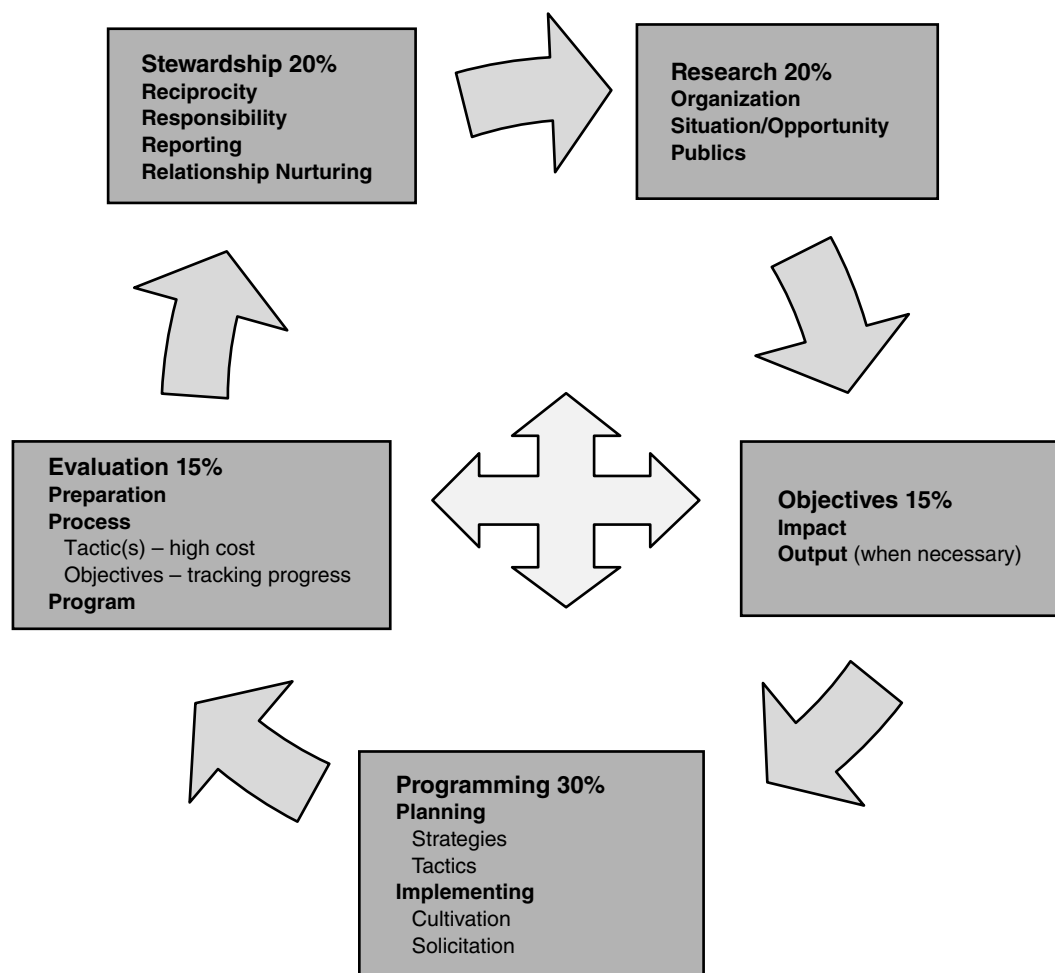

Figure 1 Kelly's ROPES Process Model

Source: © K. S. Kelly (2012).

Yet because of high demand and a shortage of trained practitioners, fundraisers command salaries approximately 50% higher than those paid to general public relations practitioners. Scholars and practitioners increasingly are drawing from public relations to build a body of knowledge that informs fundraising practice and education. The effort is commendable given the important role that fundraising plays in the U.S. democratic society.

FUTURISM AND TREND ANALYSIS

Futurism in public relations refers to attempts to project trends through analysis of current or historical data for the purpose of strategic communication planning. Futures research focuses on developing methodologies for identifying and analyzing future trends for long-range forecasting and planning. While calls for practitioners to look toward the future began in the mid-20th century, as a response to the perceived narrow focus of public relations practice on past experience and immediate circumstances, interest in futurism grew dramatically in the 1970s and 1980s, fueled by technological advances in communication and information systems. In recent years, the push to incorporate trend analysis into public relations has paralleled the growth of the Internet and social media and the accompanying unprecedented access to social data.

As a movement, futurism in the social sciences became prevalent beginning in the late 1960s, spearheaded by futurologists such as Olaf Helmer (a researcher at the Rand Corporation), and continued into the 1970s through the writings of futurist scholars Joseph Martino, Victor Ferkiss, and others. Given its roots in computer science, the early field reflected a mid-20th-century fascination with the potential to use computer database technology and burgeoning communication systems as aids for decision making and prediction, a push to apply the same scientific principles to social contexts as the natural world. The conviction that science and technology held the keys to the future was a recurring theme in the age of space exploration and early computer technology.

Futurism has been associated with the growing connection between public relations and public policy. As the field moved into the 1980s, futurist authors emphasized the potential for public relations practitioners to use their skills and positions within organizations to influence policy decisions. Futurism was seen as a means of using forecasting methods to identify long-term trends in policy-making environments and determine appropriate interventions. Futurism thus became closely linked to issues management, although it is important to note that these are distinct practices. Futures research can support issues management, but not replace it.

Arguments made in support of a futurist orientation in public relations have included improved ethics, more accurate and effective strategic planning, and more timely development of targeted crisis avoidance strategies. For example, in one of the earliest writings on the subject, J. Carroll Bateman urged public relations professionals to emphasize “the future factor,” as a stimulus to behave more ethically by taking a long-term approach to communication. Thirty years later, Judy VanSlyke Turk proposed a “sequential futures model” based on a combination of environmental scanning; trend extrapolation based on historic events; Delphi studies tapping the judgments of decision makers, staff, and experts; and hypothetical scenario building. She argued that incorporating these futures techniques into regular professional practice would make it possible for an organization not only to predict but also take a proactive role in constructing its own operational context.

The term *futurism* is rarely found in the current public relations literature, but the spirit of technology-driven trend analysis and forecasting is alive and well in the social sciences and still present in some strands of public relations research. Today futurist techniques have largely been folded into the growing influence of “big data” research in the social sciences, thanks to a media and communication environment that allows for relatively easy access to previously unthinkable amounts of data, often in close to real time. Data scraping and mining procedures borrowed from computer science and statistical market research provide massive datasets that can be analyzed for patterns on which to base strategic decisions, while social media make it feasible for organizations to develop tailored communication programs targeting increasingly fine-grained segments of stakeholders.

One significant difference between early futurism and more recent research in this vein is the incorporation of nonlinear causality. Early futurism was strongly influenced by research in economics, which presumed humans to be rational actors whose behaviors could be traced to isolated variables with clear directions of cause and effect. The advent of chaos and complexity theories, which emphasize uncertainty and complex interdependencies, have led current researchers to accept

that accurate long-term forecasts are likely impossible given the vast number of variables involved in any social context, all of which may significantly alter the course of future events. Similarly, advancements in network science have been increasingly influential in applied communication research, leading scholars to focus on developing new methods for understanding patterns of influence within densely connected systems of organizations, individuals, institutions, and messages.

One example of a study in this current line of trend research in public relations is a 2010 analysis by Priscilla Murphy of news releases and media coverage of homemaking celebrity executive Martha Stewart over the first 25 years of her career, sampled around 18 critical events, including her conviction and imprisonment for obstruction of justice and lying to government officials investigating insider trading and her subsequent career trajectory. The study used a form of computerized textual analysis known as semantic network analysis to identify patterns of influence within the news releases and media stories, finding that this method made it possible to identify the formation of potentially damaging reputational patterns, in some cases long before these culminated in negative outcomes for Stewart. One conclusion of this study is therefore that adoption of current trend analysis methods and the use of appropriately large data samples can allow public relations practitioners to identify future trends in time to attempt corrective strategic measures. At the same time, the study suggested that media campaigns have limited effect on entrenched media representations of reputation. Futures research should therefore not be approached as a panacea but as one of many tools that can be used within a comprehensive public relations program.

Thanks to the availability of new kinds of data as well as advanced research technologies, trend analysis has thus recently undergone a renewed level of interest among public relations scholars and practitioners, particularly those interested in questions of reputation, issue, and crisis management, for which predictive information is most obviously and immediately useful. Futurism has been criticized for being narrowly focused on linear outcomes and overestimating the potential effectiveness of intervention efforts. More nuanced approaches shaped by newer analytical methods

and theoretical frameworks may help address those criticisms and fulfill the early promise of futurism as a valuable diagnostic tool for organizations.

G

GAME THEORY

Game theory, introduced to the public relations literature in the 1980s, underpins a conflict-to-cooperation continuum used to classify communicators' motives. Game theory inspired the reconceptualization of public relations' normative two-way symmetrical practice model. Overall, game theory approaches may enhance decision-making and relationship-maintenance skills among various constituents, enabling practitioners to navigate complex systems and to make public relations more ethical and professional.

Game theory has a rich history and long has been embraced among the social sciences of psychology, management science, and political science. *Games* is a metaphor applied to a wide range of human interactions that depend on how two or more persons (and other entities) directly and strategically relate with one another. This approach to modeling human behavior was developed in 1944 by mathematician John von Neumann and mathematical economist Oskar Morgenstern. Rational choice theory provides game theory's underpinnings, and it has been invoked in debates on complex policy issues such as market competition, arms races, and environmental pollution. Game theory resonates with public relations theorists *and* applied practitioners because understanding the balance of influence between an organization and its constituents is central to doing public relations well and ethically.

Specifically, game theory enabled public relations researchers to expand the range of communication behaviors by redefining *symmetric* communication (games of pure cooperation)—which rarely happens in actual public relations practice even though many theorists agree that it is preferable to *asymmetric* communication (zero-sum games). To illustrate, whereas a three-legged race might be classified as a game of pure cooperation (or non-zero-sum game), a tug of war is a zero-sum game because there exists a direct correlation between participants' performance; the better one player does, the other performs incrementally worse. Since game theory was added to the public relations literature, two-way symmetric communication has been redefined as a "mixed-motive" behavior. Such a framework maintains that while organizations may have asymmetrical self-interest concerns at the core of all behaviors, each is motivated toward cooperation in order to resolve or to reduce some aspects of conflict associated with relationship building and maintenance.

Game theory inspired crisis communication researchers to consider multiple perspectives and to avoid binary dualisms that limit the full range of possible communication behaviors (Murphy, 1989, 1991); that perspective expanded to account for organizations' permeable boundaries and complex systems (Gilpin & Murphy, 2008). Many have argued that public relations practice should not be forced to fit into one of four models (press agency, information, asymmetry, and symmetry) because it is a profession and an arena of academic inquiry that involve many variables that

interact in complex and vibrant ways. For example, it may be prudent to maintain some degree of tension (as compared to pure cooperation or total accommodation) among competing interests that are at ideological odds in order to foster continuing dialogue needed to achieve a desired outcome that may never have a final conclusion.

Game theory thinking advances ethical decision making, accommodates strategic planning, and promotes professionalism. Game structures are used to analyze crisis communication issues and to navigate seven principles of complex systems that affect crisis management: interacting agents, adaptability, self-organization, instability, influence of history, permeable boundaries, and irreducibility. Such analyses of organization–constituent relationships in times of crisis may be used to determine what went wrong and to explain why. Also applying game theory to strategic planning enables practitioners to confidently examine what-ifs and best-/worst-case scenarios, as well as to develop strategic alliances and build coalitions. The game becomes a negotiation involving commodities, strategic trades, and concessions, wherein, optimally, there are no clear-cut winners or losers. Since game models involve determining all possible consequences and a full range of potential behaviors, public relations practitioners may more clearly examine the ethical implications of their counsel.

Games also play a role in journalist–public relations exchanges during crises. For example, while a public relations practitioner hopes that reputation-damaging news coverage is minimal, a journalist is rewarded for scooping competitors and for producing stories that tap into enduring news values of conflict and disorder. This struggle has been compared to a classic duel where the organization scores a “hit” if it delays communication long enough to allow the crisis to abate (resulting in no media coverage) or if it *steals thunder* by breaking the news of a crisis (that is likely to be discovered anyway). On the other hand, a media outlet scores a hit if it is the first to break the news about an organization’s crisis.

Therefore, game theory + public relations theory = ethical and analytical frameworks for maintaining and developing relationships between complex organizations and constituents.

GAMING/PLAYSPACE/ SOCIAL GAMING

Video games are interactive, rule-based entertainment playable on electronic devices such as video game consoles, personal computers, or other

devices. These platforms create a playspace in which players interact with the game to achieve desired outcomes such as higher scores, prizes, or narrative advancement. Often, these games contain social elements that encourage interaction between players, as well as systems of feedback and positive reinforcement that make them useful for conveying persuasive messaging.

Video games have become a part of global culture and a popular social activity. Players play video games offline as well as online through services like Xbox Live, Steam, and Playstation Network. Many games are also available on handheld platforms such as the Nintendo 3DS and smartphones like the iPhone. The latter is a growing market due to its relatively open nature and lower development costs; mobile titles like *Angry Birds* and *Cut the Rope* are among today's most popular games.

Social games, which are built around social networking websites, are another growing area. Games such as *Farmville*, *Mafia Wars*, and *Avengers Alliance* are among the most popular social games. Most social games are asynchronous (meaning that players do not play at the same time), and encourage players to return every day to accomplish specific goals. Social games are generally aimed at casual players; many offer an opportunity to spend real money to buy in-game credits and rewards. Facebook is probably the most popular platform for such games and has implemented proprietary currency that players can purchase and use in the games of their choice. Large-scale online games such as *World of Warcraft* and *Second Life* also have their own in-game economies where items and currency can be equated to real-world dollars.

Recent research has suggested the potential for persuasion and message delivery in games. As game design scholars like Jane McGonigal and Ian Bogost suggest, games can be used to advertise products, inform players about current events, and encourage healthy habits because they provide systems of rewards and feedback (like higher scores and progress tracking) that encourage players to more deeply engage with the material. For example, games like *Debt Ski* (an action game aimed at teaching young adults about responsible financial management) and *World Without Oil* (a collaborative simulation in which players prepare for a world without petroleum) offer entertainment and

the ability to test ideas in a consequence-free space, while the *Wii Fit* series tracks calories burned during exercise activities and offers tips and goals to encourage players to stick to a healthy regimen. Regardless of form, games can be used to convey messages to interested publics.

GANTT CHART

For public relations projects, practitioners need a system for keeping track of the tasks that need to be done and those that have been completed. Henry Gantt invented the Gantt Chart as a way to track tasks for a project. The Gantt Chart is used in a wide variety of fields that involve project management. To build a Gantt Chart, the practitioner must identify all the tasks to be completed, the time each task will take to complete, and the sequencing to the tasks. The first step involves brainstorming and listing all possible tasks for the project. For instance, a simple news release could require researching the topic, drafting the release, selecting appropriate media targets, approving the news release's content, choosing proper contact names and addresses for the media targets, and distributing the news release. Next, the practitioner determines how much time each task will take. Assigning time demands that the practitioner understands the factors that affect the time it takes to complete a task.

Finally, the practitioner develops the sequence of the tasks. Sequencing requires that the practitioner separates contingent and concurrent tasks. Contingent tasks are those that are dependent on another task: Task A must be completed before

Task B. For instance, research must be completed before a new release is written. All contingent tasks are arranged in the proper sequence. Sequences from the earlier example would be (a) research-draft-approval and (b) media selection-contact information. Both sequences are needed to arrive at the final task, distribution. Concurrent tasks are tasks that can be done simultaneously because they are not contingent on one another. The practitioner can select media and locate contact information while waiting for approval of the news release.

A Gantt Chart takes tasks, time, and sequence and displays them graphically. The horizontal axis on the chart is the time and the vertical axis represents tasks. Bars on the chart mark time. The unit of time depends on the nature of the project. The time units could be hours, days, weeks, or months. The longer the bar, the more time the task takes to complete. Lines drawn between the bars are used to connect the sequential tasks. Bars that overlap in time represent the concurrent tasks. A Gantt Chart makes it easy to “see” the sequential and concurrent tasks: what has been completed, what still needs to be done, when each of those tasks must be finished, and whether the project is on or off the schedule. A Gantt Chart is both a planning document and a means to monitor the progress of a project, and it works best for smaller projects. For large, highly complex projects, a practitioner is better off using the PERT Chart (Program [or Project] Evaluation and Review Technique) to organize, illustrate, and track the project. Microsoft Project is one of a number of software programs that provide templates for constructing Gantt Charts.

Gantt Charts are valuable planning aids to practitioners but are only as good as the work that goes into creating them. If a task is left off the Gantt Chart or times are miscalculated, the value of the Gantt Chart is reduced or completely lost. Therefore, careful preparation is necessary to develop a chart that truly reflects the demands of the project.

GATEKEEPERS

Gatekeepers are communication professionals who are involved in the traditional news selection process. They sort through a number of messages, shaping chosen messages before delivering them to viewers, readers, or listeners. Gatekeeping involves selecting, shaping, displaying, and withholding messages. In news organizations, reporters, copywriters, photographers, editors, or even media owners function as gatekeepers by choosing and shaping newsworthy messages. In a more social context, public relations professionals, government officials, and other social actors play a role in gatekeeping by deciding on what messages are disseminated to news organizations and by controlling the channel of news information.

The term *gatekeeper* was originally coined by sociologist Kurt Lewin in his study of the primary role of housewives in the family’s changing food habits. Lewin proposed that housewives directed the flow of food items and therefore functioned as “gates” or gatekeepers; later the term was applied to the news selection processes. David Manning White’s 1950 study of a small-city daily newspaper editor found that the news selection process depends on the editors’ news values or on what they consider newsworthy. The gatekeeping phenomenon is linked to the channel concept in the conceptual models of communication given by Bruce H. Westley and Malcolm S. MacLean and Wilbur Shramm.

Gatekeeping is a broad function that occurs to affect the flow of information in the channels between senders and receivers of messages. Gatekeepers determine what messages are selected or rejected. Messages travel through certain communication channels and certain points within the channels function as gates, which are managed mostly by gatekeepers. Originally gatekeepers were viewed as individuals, such as journalists working for the traditional media of television, radio, and wire services.

However, decisions on what messages will make the news information are also influenced by a number of other factors. Pamela J. Shoemaker (1991) suggested the complexity of gatekeeping by a number of gatekeepers at various levels: by communication routines and by organizational,

social, and institutional (extra-media) systems. Thus journalists are influenced by their news values or practices, budgetary or time restrictions, competition with other media, advertisers, social ideology, and other factors that also function as gatekeepers in the gatekeeping process.

The gatekeeper concept has recently changed. Journalists traditionally functioned as gatekeepers, but they now use information subsidies provided by public relations professionals for reducing the costs of information gathering. Such subsidies occur because public relations practitioners supply newsworthy information to reporters. This professional service reduces the costs of news organizations. They can use the information provided by practitioners in various forms, such as press releases, backgrounders, and fact sheets. They have interviews handed to them. Many news reports are little more than edited releases supplied by public relations professionals. And with the advent of the Web, information can be available to reporters in a commodified form 24/7.

The advance of online media has also changed the gatekeeper role of journalists. More organizations, companies, and authorities directly reach their publics through online media without journalists' gatekeeping. Public information officials, governmental or corporate spokespersons, and other public relations professionals have increasingly assumed the gatekeeper role by judging what information can be shared with key publics or how communication with those publics can be managed as practitioners serve as boundary spanners. As organizations become primary sources of information, journalists are sometimes less influential in the gatekeeping process because people can obtain information from the organization without the help of journalists.

GENDER AND PUBLIC RELATIONS

The definition of gender is a subject of debate within the social science literature. In public relations study and practice, it is important to appreciate the different understandings of gender that are informed by different assumptions and perspectives specific to gender, gender roles, gendered performance, and gender identity as they apply to public relations.

Gender

In popular use, the terms *sex* and *gender* tend to be used interchangeably. Indeed it has been noted that *gender* has become a polite euphemism for *sex* in everyday use. However, there is a distinction between the two terms. While *sex* refers to the biological categories of male and female, *gender* refers to the idea that what we understand as masculine and feminine is socially and culturally determined.

In other words, gender constitutes particular values and expectations of behavior in different social and cultural contexts. Theorists note that early gender research that took place in the 1970s was focused on sex-based differences or what is known as “binary” categories that place the male above the female—for example, the difference between women’s and men’s speech in interpersonal communication. From this type of study, women could learn

how to use more assertive language. Since the 1970s, social theory has developed to conceptualize gender as fluid, socially constructed and as an aspect of a person's identity during social interactions (see examples below under Gender Identity).

Gender Roles

Gender (or "sex") roles are those that are ascribed to women and men in public relations according to employers' assumptions about the kind of tasks that female and male public relations practitioners should undertake. (These assumptions are also known as "gender ideology.")

The debate concerning gender roles is important in public relations because in many countries where the profession is highly developed, including the United States, the United Kingdom, Germany, and Australia, there is a female majority in public relations comprising approximately 70% women and 30% men. Typically in these countries, women tend to occupy the junior and intermediate "technician" roles in public relations such as crafting press releases and organizing events; whereas men tend to occupy the "communication manager" role that involves strategic planning and offering advice to top management.

This division of labor between men and women is known as vertical or hierarchical "gender segregation" of the workforce. A concern for feminist scholars is that "gender discrepancies" or differences in recruitment practices, salary, and promotion in public relations leads to gender inequalities in spite of a female majority in the profession. In 2002, Linda Aldoory and Elizabeth Toth found that gender discrepancies were attributed (by practitioners) to differences in the socialization of women and men; sex discrimination and sexism; unrealistic expectations of women who balance family and work; biological determinism (e.g., being a man or a woman influences a practitioner's ability to be decisive); skills differentials; favoritism toward men due to their low numbers; type of organization influences access to promotions; and a belief that gender discrepancies in promotions do not exist.

Gender as Performance

Gender as performance is widely attributed to the work of social theorist Judith Butler who, in 1990,

conceptualized gender as an aspect of identity that is repeatedly performed and embodied; gender is what people *do*, not *have*. Gender, according to this performative concept, is dependent upon social interaction; it is collaboratively or socially accomplished.

Performative theory, which is advocated by those who write about "doing gender" has a central role in contemporary research on gender and communication. Here, the role of discourse takes center stage, framing performances of gender as either masculine or feminine rather than assigning these performances to the biological categories of women and men. In organizational discourse, in particular, the masculine is placed above the feminine so that a patriarchal way of speaking becomes the accepted norm. Practitioners, and women practitioners in particular, may be compelled to adopt a gender-neutral or a masculine stance in their language, behavior, and dress in order to adapt to organizational contexts where expectations are oriented toward a masculine model. Other organizational contexts may demand performances of both women and men that may be categorized as feminine. An awareness of the importance of performance in different social and cultural contexts may in turn help practitioners understand why gender segregation exists—in other words why women are generally assigned technical support roles and men management roles, and that specific gendered performances may help or hinder career progression, even when an organization professes to be nondiscriminatory.

Gender Identity

Gender identity refers to the identity that people ascribe to themselves as men or women. Gender identity may be played out, or performed, in different ways in response to a number of social influences, including socialization, organizational culture, professional codes, the social context external to the workplace, and how a person wants to be perceived within those contexts.

Some of these identity "performances" may be reflexive and conscious and some of these performances may be un-self-conscious so that while in a work context, a person may consciously present himself or herself as "tough" so that he or she will be perceived as tough (i.e., masculine); in another,

perhaps a personal context, the person will not attend to such a conscious performance. Researchers examining women's identity in public relations have noted that some women, conscious of the sociocultural context of public relations, tend to adopt a "gender-neutral" identity within the workplace to avoid being stereotyped as feminine. Men working in public relations, however, may confront different challenges to their identity. They may have to emphasize their masculinity during social interactions both within the workplace and outside it by redefining the professional role as masculine and by distancing their practice from the popular stereotype of public relations as a "soft" or "fluffy" profession.

GEODEMOGRAPHICS

Public relations professionals use geodemographic data to learn about stakeholders and publics. *Geodemographics* is the process of combining demographic and psychographic information with geographic or location-based information. Typically, a geodemographic system combines three types of data: (1) enormous electronic databases of public and private, individual and group, characteristics and information; (2) a geographic information system; and (3) a factor, cluster, or

network analysis of beliefs, values, and ideological behaviors.

Public information and persuasion campaigns are often aimed at unfamiliar publics—especially in the case of an agency—and serve the needs of diverse publics. Thus, public relations professionals see geodemographic data as a precursor to more useful and accurate data about stakeholders and publics derived after long-term relationship have been built.

For many public relations professionals, geodemographic data are useful for background research (the R in the RACE/ROPE acronym—research, analysis, communication, evaluation), and understanding what stakeholders and residents are like in neighborhoods or regions. Although useful in public relations, geodemographics has been criticized by some public relations professionals as a tool of marketing.

The field of geodemographics goes back to English sociologists and demographers of the 1950s. Jonathan Robbin is credited with developing the first computer-based geodemographic systems in the early 1960s and 1970s. Thus, the field is quite mature.

Geodemographic data are most often used by marketers and advertisers to target specific types of consumers. PRIZM (Potential Rating Index for ZIP Markets), for example, the nation's first geodemographic system, used census and survey data to develop 40 lifestyle profiles for consumers in 36,000 U.S. ZIP codes.

Given the depth of information mined, and the constantly changing location-based data, individual communicators cannot simply gather geographic, demographic, and psychographic information and be able to target key publics with precise messages. Many professional communication agencies develop comprehensive profiles of their target publics and stakeholders using geodemographic data as one part of the profile. Enacting geodemographics requires vast amounts of data and skilled demographers, researchers, and statisticians. Additionally, only modest marketing gains of 2% to 3% are often realized by geodemographic data, but because of the scale of marketing efforts, such small gains can mean a lot of new customers and sales.

Although originally developed in the United Kingdom for use in urban public policy, and by the Department of Housing and Urban Development

(HUD) in the United States, the field of geodemographics has evolved primarily into a marketing and sales tool. Geodemographics links together diverse data sets and detailed profiles of potential publics, enabling complex decisions to be made. For example, geodemographic data have been used in television ratings for programming decisions, credit score calculations to make lending decisions, and consumer product development decisions.

Geodemographic data are gathered via websites, point of purchase sales (cash registers), telephones (call centers and sales), and aggregated data purchased by organizations, and through marketing and advertising organizations. Geodemographic data must be regularly updated and refined to maintain their usefulness and accuracy. Neighborhoods, cities, and regions do not change overnight, but they do change quickly as a result of layoffs, immigration, economic trends, or employment opportunities. Geodemographic data offer a starting point for more refined and useful organizational information.

New Technology and Geodemographics

Decades ago, scholars like Nicholas Negroponte (1995) predicted that our everyday technologies would be used to track the whereabouts of individuals and enable businesses and marketers to exploit personal and collective geodemographic data. Within a few years, Negroponte's predictions may be a complete reality, as technology plays an even greater role in citizens' lives

Social media and other new technology have proved a boon for marketers and advertisers, with the ability to gather geodemographic data as part of so many new technologies. Software and social media applications like Facebook and Google Earth use geographic data to track user whereabouts, just as hardware in computers, automobiles, smartphones, and other devices also secretly records data about purchases, travel and vacation patterns, commuting, preferred businesses, restaurants, and a host of other data.

Many companies sift through millions of social media records, photographs, blog postings, and user profiles in order to cull useful marketing and advertising data. The ability to link raw demographic and psychographic data to geographic

data, and information from other sources has been simplified through the widespread use of location-based data and services (LBS) among smartphone users and users of hand-held devices.

Ethics of Geodemographics

As communication professionals, not marketers or advertisers, public relations professionals need to take a stance regarding the gathering of personal data on stakeholders and publics. Since early in the last century with Ivy Ledbetter Lee's "Declaration of Principles," public relations has been a profession where accountability to stakeholders and publics, and relationships with key stakeholders, ultimately define the nature of the organization-public relationship.

Professionals, corporations, and agencies regularly make decisions about whom to target with messages, and what to say in persuasive appeals based on the nature of consumer or stakeholder relationships. Geodemographic data might be effective in quickly learning about potential publics, or they might be used just as another way to exploit people. The use of geodemographics should be thoroughly considered before implementation.

GERMANY, PRACTICE OF PUBLIC RELATIONS IN

Germany, the largest country in Europe with 82 million inhabitants, enjoys a strong and global economy; it has seen a broad evolution and professionalization of public relations since the 1990s. Within a few decades, the profession as well as the research and education system have developed to a fully established field.

At the same time, the term *public relations* (and the traditional German synonym *Öffentlichkeitsarbeit*) is diminishing and mostly replaced by concepts like “corporate communications” and “communications” in practice or “communication management,” “strategic communication,” and “organizational communication” in academia. This taxonomy does not necessarily correspond with different conceptual perspectives. The change in terminologies mainly resembles a move from the traditional concept of public relations featuring media relations and other tasks aimed at gaining publicity and influencing public opinion (i.e., staging events, publishing corporate media) to an understanding of communication as a holistic function that organizations utilize to define missions and identities, handle stakeholder relationships, pursue their interests in markets or society, and legitimize their strategies within the public sphere.

Professional Field

In absence of formal accreditation systems and census data, the total number of people working in public relations is unknown. Approximately 7,500 practitioners are organized in the major associations *Deutsche Public Relations Gesellschaft* (DPRG) and *Bundesverband Deutscher Pressesprecher* (BdP). Databases by service providers list more than 30,000 full-time professionals in the field. According to several large-scale studies by Günter Bentele and colleagues, more than 90% of the professionals have an academic education, usually on the master’s level. Most of them have a background in communication and media studies or journalism (22%), other fields of social sciences or humanities (39%), or business (15%). The most common self-perception is being a mediator

between organizations and publics (82%). Almost every second professional perceives himself or herself being a consultant to top management, spokesperson, or lobbyist.

Within organizations, the communication function usually reports directly to the CEO or management board, with responsibilities for external and internal communications. Financial communications is mostly a separate, smaller function on the same level. Marketing communications and advertising are traditionally separated and located within business units; they often enjoy less management influence but larger budgets.

The market of consultancies, agencies, and service providers in Germany is quite diverse. Leading public relations agencies serving all kinds of clients including many multinationals based in Germany are mostly privately owned with up to 300 employees. International networks have a much smaller market share than in most other countries. A number of high-end consultancies have specialized in fields like mergers and acquisitions, change communication, and auditing and controlling. Local agencies and consultants serve the large number of small- and medium-size companies as well as public institutions.

The large German-speaking market, which also includes Austria and parts of Switzerland, has generated a number of service providers for media analysis, distribution, measurement, online benchmarking, training, and headhunting, for example, who constantly develop new methods and services but seldom offer them abroad.

Research and Theories

Germany has a relatively short, but rich tradition of theory building in public relations and communication management. Due to a lack of institutionalization in universities, the debate until the 1990s was mainly shaped by concepts developed by practitioners (Albert Oeckl and Carl Hundhausen) who defined public relations based on mainstream practice and early U.S. theories.

Management-focused models from the United States as well as normative concepts based on models of dialogue became popular in the 1990s. Since then, neither the excellence theory nor rhetorical and critical approaches nor organizational communication have been widely accepted as basic

paradigms within theory building to the same extent as in other regions. Instead, German scholars have developed a broad range of macro-, meso-, and microlevel theories based on concepts from sociology (Niklas Luhmann, Jürgen Habermas, Anthony Giddens), communication and media studies, and management research.

Key topics include trust and credibility, interaction between media relations and journalism, ethics, measurement and evaluation, reputation and issues management, institutionalization, and strategic planning. Public relations is, on the one hand, analyzed from an organizational perspective and at the same time conceptualized as a specific system, sphere, or function within society. This links the German discussion to the European debate on reflective communication, which tries to bridge the gap between functional and critical approaches by focusing the nexus between action and structure, organization and society, self-interest and common welfare.

Academic research in the German-speaking countries is largely housed within communication science, utilizing both quantitative and qualitative methods. The growth of the field has led to a rising interest in critical, discursive, and hermeneutical approaches. Some niches are discussed by scholars from media science and linguistics, while business scholars neglect the field almost completely.

More than 150 scholars are organized within the PR and Organizational Communication division of the German Association for Communication Science (DGPK). The group, active since 1991, has contributed to the development of the body of knowledge by organizing annual academic conferences and publishing a number of edited books. The large national community and the German academic tradition of publishing key concepts in books instead of journal articles also mean that the majority of research is not available in English.

Since the first professorships for public relations were established in Berlin and Leipzig in the late 1980s and the early 1990s, the infrastructure for research has quickly expanded. Nowadays, most communication schools have a full professorship and several research associates or PhD researchers working in the field. In 2010, the institutionalization of research has been advanced through the establishment of the Academic Society for Corporate Management and Communication. Within this

network, four leading universities and 20 global corporations collaborate to identify research issues, finance and conduct studies, and transfer knowledge between academia and professional practice.

Education

Many public relations professionals working in the field have learned their profession on the job and received additional training in traineeships and internships or courses offered by branch associations and private training providers. Research universities and universities of applied sciences (polytechnics) started to offer seminars and courses in the 1990s as part of degree programs in communication. The first full-time programs were established at the beginning of the 21st century. Since then, several master programs combining a focus on research and professional education have been established (Leipzig, Stuttgart-Hohenheim, Mainz, Münster, Greifswald). Public as well as private universities of applied sciences offer a number of full-time and part-time bachelor and master programs with a professional focus. Due to the public funding of universities and the attractiveness of the job market, capacities are much lower than the demand from prospective students. This means that the future will see a diverse workforce, while the highly qualified group of graduates educated on the master's and PhD level has started to enter leadership positions in the field.

GHOSTWRITING

Ghostwriting is the process whereby one person, usually a professional writer, writes a document or a speech that another person then delivers and represents as largely that person's own work. The professional writer or "ghost" lends skills in message preparation to the speaker, and the speaker takes advantage of these skills. The writer is described as a ghost—being invisible when the speech is actually delivered. Ghostwriting is a well-entrenched part of many communication professions including public relations and political communication.

Senior political figures regularly employ professional speechwriters. Many business executives similarly employ professional ghostwriters to help craft speeches, letters, and other documents. Speechwriting in most organizations is a specialized aspect of the larger public relations function. Ghostwriting is also practiced in some publishing circles. Among the most celebrated modern ghostwriters was Peggy Noonan, President Ronald Reagan's speechwriter. Noonan described the speechwriting process as one of balancing competing interests and managing successive reviews and revisions. The principal issues surrounding ghostwriting are effectiveness and ethical concerns of masked authorship and the possibility of deception. Deception occurs when those "pearls of wisdom" voiced by one person are actually the work of someone else. The person who delivered the message does not have the time or talent to craft the message but receives credit for it. The ideology expressed in the message may come from the author more than from the person who delivers it.

Ghostwriters are generally believed to be able to produce more effective messages than would the average executive or politician working alone because the ghost has specific communication and writing skills. Moreover, ghosts can spend much

more time preparing a speech, researching the audience and issues, and developing arguments than can a busy politician or executive. Ghostwriting is often justified on the grounds that it saves valuable executive time.

One of the key features of effectiveness is the ability of the ghost to successfully write for a particular speaker. Speechwriters must be very knowledgeable about their client's specific interests, positions on various issues, and speaking style. The relationship between speaker and writer is most effective when it is characterized by openness and trust. Writer and speaker should work closely as a team to construct a speech that each is comfortable with. Mike Morrison, former speechwriter for Lee Iacocca, noted that "when a speaker comes to trust the writer to capture his voice and to articulate his position in that voice, the process can be very smooth." Ghostwriters are also most effective when their participation goes unnoticed. An unwritten rule of ghostwriting is that the ghostwriter remains anonymous. In general, ghostwriters should not be publicly identified with a particular speaker or speech.

The ethical questions surrounding ghostwriting cluster around issues of honesty and deception. Specifically, some critics charge that using a ghostwriter is a kind of deception: a fraud or plagiarism whereby the speaker implicitly claims that the speech is his or her own. Because credibility, according to traditional models of ethos, is created by the speaker "speaking well," the speaker must be the author of the speech. Ancient writers on rhetoric, such as Aristotle, Cato, and Quintilian, all embraced the view that credibility arises during the speech as the speaker demonstrates personal reasoning, moral character, and skill. Ghostwriting short-circuits this credibility-building process by allowing the speakers to substitute the words of a professional writer for their own. Some have suggested that this deception is not an issue in modern political or corporate contexts because the use of ghostwriters is essentially an open secret. Audiences have come to expect that those in leadership positions will employ professional speechwriters to assist in the preparation of their messages. Other critics have noted that in cases where a ghost is employed, the speaker is usually fulfilling a larger representative leadership role. The speech, therefore, is best viewed as a corporate or organizational

product much like an advertisement or brochure. In these cases, credibility is generated for the organization rather than for the specific speaker.

Ghostwriting, although a specialized niche in the public relations profession, is often viewed as an access point to strategic organizational and management functions. Because the ghostwriter is in a position to influence what senior executives are saying, the ghost may also influence strategy. Ghostwriting services are provided by most internal public relations departments, public relations and advertising agencies, political consultants, and specialized freelance writers.

GIVING, DONATIONS, AND GLOBALISM

Globalism is the condition that has arisen from the processes of globalization over the last couple of decades. Driven by advances in communication and financial technologies and the global restructuring of capital, globalism is characterized by complex connectivity between economic, political, and cultural spheres across the globe. Within these conditions, large multinational corporations and global financial institutions such as the World Trade Organization and International Monetary Fund have become powerful players. They have

been increasingly challenged by antiglobalization activists who have become well organized transnationally. Furthermore, nongovernmental organizations (NGOs) have risen in numbers to address the social problems and concerns of globalization that are ignored by business and government. Overall, various stakeholders expect that powerful global entities will engage in sustainable development and share their power by giving back to the communities and regions where they do business and from which they profit.

Public relations is in an ideal position to mediate between global corporations and organizations and their various stakeholders to build goodwill and steer powerful corporations toward becoming responsible global citizens. This is because public relations (a) is expected to and in a position to engage stakeholders and (b) is ideally expected to be the corporate conscience and maintain mutually beneficial relationships between the corporation or organization, its communities, and stakeholders.

Key ways to achieve responsible global citizenship include corporate giving, community involvement, donations to and partnerships with NGOs and nonprofit organizations, and engagement in sustainable development projects. Such engagements, according to Margarete Hall (2006), enable corporations to build communal rather than just exchange-based relationships with key stakeholders. It is the practitioner's responsibility to convince senior management of the moral significance of such engagements and publicize the good citizenship of the corporation. In fact, current research shows that philanthropy and related projects that collectively fall under the label of corporate social responsibility (CSR) are increasingly on the agenda of many global corporations. Most of these corporations report their CSR activities through their websites and other venues. However, according to Daejoong Kim, Yoonjae Nam, and Sinuk Kang (2010), they are deficient in including dialogic components in their reporting, and their CSR communication remains mostly one way.

Corporate giving, donations, and CSR take on a more holistic and complex form at the global level since a balance between global and local issues needs to be achieved. Indices such as the United Nations Global Compact and the Global Reporting Initiative are available to guide the CSR programs of global corporations. According to Sora

Kim and Yoon-Joo Lee (2012), companies need to remember that publics are not hoodwinked by self-serving CSR activities that are simply reactive to crises or driven purely by financial gain. Furthermore, argued David McKie and Debashish Munshi (2007), since most global corporations are based in the West, the postcolonial argument that the West continues to colonize the third world economically and culturally needs to be better understood, respected, and addressed through global giving, donations, and dialogic CSR engagement.

GLOBAL ALLIANCE FOR PUBLIC RELATIONS AND COMMUNICATION MANAGEMENT

The Global Alliance for Public Relations and Communication Management (Global Alliance) is a confederation of the world's major public relations and communication management associations and institutions, representing 160,000 practitioners and academics. This nonprofit organization is registered in Switzerland with administrative headquarters at the Università della Svizzera Italiana in Lugano. It serves approximately 70 industry organizations

from Africa, North and South America, Asia, Europe, the Middle East, and Oceania.

Membership includes professional associations such as the Public Relations Society of America and the Shanghai Public Relations Association; international bodies such as the International Association of Business Communicators and educational organizations such as the European Public Relations Education and Research Association and various leading academic institutions. A prerequisite of joining the Global Alliance is that members agree to its international code of ethics, incorporating its principles into their own codes.

As society, organizations, and issues become increasingly globalized, connected, and complex and as stakeholder communities proliferate and extend across the world, the requirement for public relations to be practiced and studied on a global basis has become apparent. Hence in 2000, a group of professional associations recognized the need for a global body to represent and support the public relations and communication management community; the Global Alliance was founded as a collaborative effort to serve the professional global community. Local, expert knowledge could be pooled and international initiatives instigated to support the profession.

The working practice of the alliance is to harness the cooperative efforts and knowledge of communication professionals, both practitioners and academics, to tackle common problems from a global perspective. It aims to enhance the influence of the profession among its constituents around the world by partnering with regional, national, and international bodies. It seeks to blend and develop research and best practice to foster professionalism. A four-part mission guides its work:

- unify the public relations profession,
- raise professional standards all over the world,
- share knowledge for the benefit of its members, and
- be the global voice for public relations in the public interest.

In furtherance of this mission the alliance undertakes a number of activities and research-based projects. Some of its principal activities follow.

World Public Relations Forum

This forum is currently a biannual event hosted by professional associations in different countries. The 2012 conference was held in Melbourne, Australia; previous host venues have included Italy, Brazil, South Africa, Sweden, and the United Kingdom. These events not only cover topics specifically related to the public relations profession but also seek to contextualize it within world and current affairs. Key speakers have included Klaus Schwab, chair of the World Economic Forum; Judge Mervyn King, author of the King Report on Corporate Governance; Paul Druckman, CEO of the International Integrated Reporting Council; and Foreign Minister Carl Bildt of Sweden, along with luminaries from the world of the media, public relations, and communications like Wadah Khanfar, former director general of Al-Jazeera network, Brian Solis, and Richard Edelman.

Each forum produces a major study that seeks to advance the profession. For example, the 2010 forum in Sweden announced the Stockholm Accords, which laid out global principles demonstrating how public relations contributes to corporate success. The 2012 Melbourne Mandate focused on how communication is changing and how the profession must change as a result.

Research Projects

The Global Alliance supports research in two ways. First, by undertaking its own research, for example, it has compiled 24 detailed “Landscapes” profiling the profession in each country. These papers examine political, economic, and cultural dimensions that affect the practice of public relations. The global curriculum project examined 218 public relations or communication management courses in 39 countries and produced guidelines for developing courses to equip practitioners to operate in a globalized world. The credentials project produced a set of seven core competencies that will be recognized by leading professional bodies as essential for practitioners to acquire if they are to attain membership.

The alliance partners with other organizations, offering access to its community of 160,000 practitioners for projects that further its mission. For

example, with Massey University in New Zealand, and building on the Credentials Project, it is studying the competencies required of the contemporary practitioner. The University of St. Gallen in Switzerland is working with Global Alliance on how to communicate complex issues with clarity in channels such as social media and on topics like communicating strategy.

The Global Alliance website hosts a range of research and practitioner reports such as that of the Spanish association, DIRCOM, on corporate social responsibility, and the German association *Deutsche Public Relations Gesellschaft* (DPRG) work on evaluation.

Partnerships and Events

Working with universities to promote standards, offering leading speakers from within its membership and working with associations to further their objectives is also part of the alliance’s work. For example, the Chartered Institute of Public Relations in the United Kingdom has hosted two Brazil Days with ABERJE, the Brazilian corporate communication association, to promote corporate understanding of working in Brazil and of the public relations profession there.

The Global Alliance’s vision is to both lead and serve the public relations and communication management profession at the international level by identifying the issues, challenges, and opportunities that unite professional associations and their members, while embracing and celebrating the diversity that enriches practice in different parts of the global community. While acknowledging generic principles and specific applications, it promotes a nonethnocentric approach to public relations and communication management, recognizing that global communication will level the playing field over time with new models of practice emerging and assuming importance as the dominance of western and northern hemisphere countries dissipates.

GLOBALIZATION AND PUBLIC RELATIONS

Globalization and public relations involves three dimensions: the impact of globalization on public relations, the impact of public relations on globalization, and the impact of public relations in the global setting on individuals and societies. This entry focuses more on the first dimension, the subject of most research on global and intercultural public relations.

Although the term *globalization* was not widely recognized until it was coined by Theodore Levitt in 1983, globalization is not a new phenomenon nor is it precisely defined by western countries according to Krishnamurthy Sriramesh and Dejan Verčič (2009). Definitions of globalization center on the increasing global interconnectedness that results from constant interchange of important factors across national borders such as economy, culture, technology, finance, and people. The consequences of globalization are widespread: Events and issues in one part of the world influence another part, if not instantly, certainly eventually. Such trends can significantly affect public relations.

Impact of Globalization on Public Relations

Two major perspectives challenge the examination of globalization on public relations: *cross-cultural comparison*, which focuses on comparing and contrasting public relations practices in different parts of the world, and *intercultural interaction*, which focuses on the actual process of communication between practitioners and publics in intercultural settings.

Cross-Cultural Comparison

In examining different public relations practices and their influencing factors, two main schools of thoughts are present: international and global, also called polycentric and ethnocentric, emic and etic, and culture-specific and culture-free. The international approach emphasizes differences in practices in different parts of the world and argues that no universal rules or principles, mostly developed in the western countries and thus likely to be ethnocentric, should apply. The global approach, however, suggests the existence of universal principles that should be applied with modifications in different areas.

Adopting a middle ground, James E. Grunig and his colleagues developed a global public relations theory of generic principles derived from the excellence study (e.g., L. A. Grunig, J. E. Grunig, & Dozier, 2002) and specific applications of these principles. Reflecting the idea of glocalization, this global theory has been expanded and refined through studies in different parts of the world.

The current generic principles of excellence feature four themes: management processes, two-way symmetrical processes, diversity, and ethics coupled to social responsibility. Several specific variables that can influence public relations practices are currently categorized as follows: *infrastructure* (political system, level of economic development, level of activism, and legal system); *culture* (societal and corporate); and *media environment* (media control, media outreach, and media access). Of particular note is the role of culture, with numerous studies examining cultural values or dimensions, especially those by Geert Hofstede (2001). Scholars such as Sriramesh and Verčič (2009) examined these specific variables through contextualized regional and country descriptions of public relations practices.

Intercultural Interaction

Research in intercultural public relations has focused on exploring the processes of communication between two important players, publics and practitioners, as they cope with globalization in intercultural settings.

More individuals are interacting with people from outside of their home countries, voluntarily or not. How organizations manage relationships

with important *publics* has become an important topic for research. T. Kenn Gaither and Patricia Curtin (2008), Lan Ni (2009), and Lan Ni and Qi Wang (2011) examined relationship management with customers, local employees in multinational companies (MNCs), and international students, respectively.

On the other hand, the intercultural competencies of *practitioners* become critical as they enter new cultural environments and build relationships with diverse publics. Practitioners should not only have knowledge about the contextualized environments but also possess trait, perceptual, behavioral, and culture-specific levels of competencies as identified by Lustig and Koester (2009). According to Wang, Ni, and De la Flor (in press), these competencies have been critical when practitioners manage relationships with local community members of MNCs.

Impact of Public Relations on Globalization

Little research exists on the impact of public relations on globalization. Some researchers have examined how certain aspects or special forms of public relations such as image cultivation efforts by governments may influence relationships at an international level. Sriramesh and Verčič (2012) explored additional aspects of culture as public relations goes global, that is, how public relations practices can have consequences on culture, which is a critical part of globalization.

Impact of Global Public Relations on Individuals and Societies

Research has also begun to examine the impact of global public relations on individuals and societies. Maureen Taylor and Marya Doerfel (2003) argued that public relations can play a vital role in nation building efforts for a civil society. So delicate is this role that critical and postmodern scholars such as Mohan Dutta (2005) caution against public relations efforts that can be used for imperialist invasions of Third World nations in the name of helping tear down the authoritarian governments and rebuild new and democratic ones.

Given the complexity and dynamism of globalization, public relations research and practice

will be challenged to make slow and steady progress to determine the appropriate role of public relations.

GLOBALIZE

Globalize refers to processes that extend worldwide in scope or application. The word particularly evokes all those processes connected with contemporary “globalization.”

Examples of globalizing processes include efforts by international agencies to globalize immunization against disease or efforts to raise awareness for the rights of vulnerable groups. Likewise, governments and supranationals (such as the World Bank) have globalized the tenets of neoliberalism, a political ideology associated with free trade and minimal government intervention in business. Large media houses globalize news stories and entertainment, heavily influencing which events gain highest visibility internationally.

As consumers, our tastes for products, services, and brands have also become more globalized. Around the world, more people seek out global brands, buy fast-moving consumer goods, and consume fast food. These globalizing processes have been driven by the growing reach of multinational corporations. The proliferation of these corporations is further associated with globalized labor practices, in which people “move” to jobs through migration while jobs are “moved” to people through outsourcing.

Public relations has played a significant role in globalizing many of the processes described above. As Michael Hardt and Antonio Negri (2000) argued in their book, *Empire*, communication helps express and organize globalization’s movement and progress. It can therefore be argued that public relations is a factor in contemporary globalization’s equation, with the growth and spread of the modern public relations industry coinciding with globalization’s movement and progress.

Globalize is a problematic term as it provides a facade for power imbalance. Few processes described as “global” truly are. Labor is not truly globalized when many workers are denied visas to enter those countries offering greatest labor opportunities or highest paying jobs. Access to many products and services is not truly global either. Many smartphone providers, for example, claim to have a global presence even though there is still no level playing field for smartphones: Some geographical regions offer little or no access

to high-speed broadband, while some countries restrict citizens’ access to the Internet. Smartphone providers themselves do not offer equal access to sales and servicing in all countries. Where public relations supports such processes, it can be argued that public relations also helps perpetuate global inequality. Even global public relations firms are not truly global since they only operate in certain countries.

Although globalizing processes attract controversy, it should be noted that public relations is also employed by activist groups and networks that contest efforts to globalize. These groups may not have substantial resources, but some have successfully used public relations to raise awareness of issues seen as by-products of globalization such as man-made climate change or questionable global financial practices.

GOALS

Effective public relations should have a purpose. Each public relations action should be designed and intended to achieve something for the organization or person developing it. It is the pursuit of a purpose that makes public relations strategic. Goals can be called directional statements because they provide the overall direction for the public relations actions.

Goals are an essential part of developing public relations strategy and evolve from formative or background research. A goal is a general statement

of what practitioners want to achieve with their public relations action(s). A goal emerges from formative research where practitioners analyze problems and opportunities that confront them and the organizations they serve. Goals cannot be set until a practitioner understands the public relations situation. The goal is framed as the rationale to solve the public relations problem or to exploit an opportunity.

A few examples will help clarify the discussion of goals. Consider two goals: (1) “to increase awareness of the Chevrolet Volt” and (2) “to improve community perceptions of Merck.” The Volt is a newer electric automobile model for Chevrolet. The problem is that people may not know about it and, therefore, may not consider it as an option when buying a new car. The general solution (direction) is to create awareness of the Volt. There is an opportunity to use public relations to help increase awareness and sales of the Volt. Merck personnel may have found that local communities where they operate do not believe it is a good corporate citizen. The problem is a negative view of Merck’s corporate citizenship. The general solution (direction) is to improve community perceptions of Merck. The goals are vague; we do not have a clear idea of the exact outcome that is desired. Objectives provide the specific outcomes for the public relations action.

Objectives are specific and measurable, whereas a goal is vague and probably not measurable. To translate the two goals used in the example above into objectives requires much more detail. Here are two potential objectives that could be drawn from our original goals: (1) “to make 75% of potential compact car buyers aware of Volt as a purchasing option” and (2) “to increase perceptions of Merck as a strong corporate citizen from 20% to 40% in communities where Merck has facilities.” In each case, the objective provides more details. The Volt objective specifies the target percentage of awareness (75%) and the specific target public (potential compact car buyers). The Merck objective seeks a specific increase in perceptions of “strong corporate citizen” (from 20% to 40%) among a specific target public (people in communities where Merck has facilities).

Goals are dangerous when they become confused with objectives. If a goal is used instead of an objective, proper evaluative research is impossible.

A goal is too vague and offers no true measure of success or failure. The public relations practitioners will be unable to clearly determine if their strategies were successful. Let us return to the simple goal “to improve community perceptions of Merck.” What is the measure of success or failure? Do efforts succeed if just one member of the community expresses a more positive perception of Merck? Practitioners cannot determine the most effective way to assess their efforts if they only have goals.

Evaluation is central to learning, and that will only occur with objectives, not with goals. Goals are general guidelines for action. The vagueness of goals makes them difficult to measure effectively. Goals are precursors to objectives and should not be used in place of objectives. Such substitution will make evaluation problematic. Without evaluation, a public relations practitioner cannot learn what works and should be repeated and what does not work and should not be repeated.

One reason for the confusion between goals and objectives is goal-setting theory, a widely known motivation theory from organizational psychology. If practitioners receive management-related training, they will probably know about goal-setting theory, which states that workers will improve their performance when they have clear, specific, and challenging goals, when they participate in setting the goals, and when they are provided with frequent feedback on progress toward the goals. Notice that in goal setting a goal is clear and specific. In other words, goal-setting theory uses the term *goal* in much the same way as public relations uses the term *objective*. Hence, practitioners versed in goal-setting theory may confuse goals and objectives. However, if a practitioner creates a true objective and calls it a goal, there is no evaluation problem because the necessary specificity is there. The real problem is when vague goals are used instead of objectives. In these cases, effective evaluation will be difficult if not impossible.

The distinction between true goals and objectives is often blurred in public relations. Each year the Public Relations Society of America (PRSA) sponsors the Silver Anvil Awards to recognize outstanding public relations work in a variety of categories, including community relations, internal communications, and investor relations. Silver Anvil Award winners should serve as exemplars of

how to perform public relations planning and action. They are the best of the best. On its website, PRSA archives the summaries of past winners. These summaries provide information about the four basic steps in a public relations effort: research, planning, execution, and evaluation. The planning section, according to PRSA, should include the identification of the specific, measurable objectives of the public relations effort. However, even a cursory review of the summaries will reveal the use of goals (vague statements) instead of objectives (specific statements).

Granted, the full Silver Anvil entry contains additional information about the public relations effort that may include specific objectives. However, if the summary has only goals, this suggests either that there are no objectives in the public relations effort or that the summary was poorly constructed. Either way, a general problem may exist with mixing goals and objectives. The value of formative research, planning, and execution is lost when a public relations effort cannot be evaluated. Goals are an important foundation for strategic public relations, but strategy becomes weak when practitioners fail to move from goals to objectives.

GOODWILL

The standards of socially responsible behavior continue to evolve with societal trends and expectations. In order to maintain public goodwill, companies must conduct themselves in a responsible and ethical manner while providing transparency

in their business dealings, accountability to their stakeholders, and sustainability to society and the environment. “Public relations bears directly upon the area of values associated with goodwill. Its task is not one of communications only, as some have supposed. Its roots reach to the very heart of corporate policy” (Hill, 1958, p. ix). These extensions of goodwill help demonstrate commitment toward a company’s stakeholders.

The most formally understood practice of goodwill is corporate social responsibility (CSR). This practice has commonly been perceived in the United States as a largely European phenomenon, since CSR is a high priority for European companies. The European Commission, in establishing social goodwill as one of the pillars of its approach to business and economic competitiveness, has set in motion a Multi-Stakeholder Forum that recommends to the European Commission how social responsibilities should be reflected in government policy and business practices. In addition, European Union countries swiftly began adopting ambitious new requirements for corporate reporting, called “sustainability reporting,” that go beyond financial results to cover the *triple bottom line*—one that shows the economic, environmental, and social performance of an organization.

However, this responsibility has not been confined to Europe, because more U.S. companies are taking goodwill practices more seriously. The growth of technology has made all types of information more accessible, leading to greater scrutiny of corporate practices around the world. “In a nation such as the United States, where public opinion is both judge and jury, any segment of the public is free to question management’s wisdom, integrity, and good human intent in handling responsibilities that amount to a public trust” (Hill, 1958, p. ix). Corporations are buffing up their social responsibilities and reputation since the Sarbanes-Oxley Act and the emphasis on corporate governance that emerged in the wake of Enron, WorldCom, and other major corporate accounting problems. This transparency also goes beyond financials into more global operations like labor practices. On a local level, more and more government agencies are expanding their standards for government contracts and requiring recipients to provide their employees with a predetermined living wage. Globally, nongovernmental organizations (NGOs), the

media, and other groups are increasingly scrutinizing human rights and labor issues and demanding internal and external monitoring.

“The corporation exists to serve the common good and must constantly justify its performance on that basis before the bar of public opinion” (Hill, 1958, p. 146). Beyond the necessary reporting requests, companies are wisely working to have an influence in setting the standards by which they will be measured. According to Hill & Knowlton’s 2002 Corporate Reputation Watch survey, two thirds of CEOs feel that corporate social responsibility initiatives contribute at least a moderate amount to their company’s corporate reputation, including the way they are perceived by groups such as customers, shareholders, and the media. In fact, participating in goodwill practices, which boost a corporation’s reputation, increases the length of time that a firm spends earning above-average financial returns and decreases the length of time that a firm spends earning below-average financial returns.

John Hill, founder of Hill & Knowlton in 1927, outlined the basic tenets of social responsibility in 1958:

Here are some of the precepts of sound policy as evolved over the years through the experience of successful corporations. Under these precepts management seeks:

To maintain or improve the financial and economic strength and welfare of the company in all ways consistent with the community and public interest. The company must prosper if it is to live and grow.

To build an efficient and loyal labor force through the best possible working conditions and wages.

To conduct the affairs of the company in a way that will reflect credit upon it and upon the system of competitive enterprise under which it lives.

To remember always that the esteem of people has no substitute and that the good will of customers, employees, the community, and the investing groups is essential to success.

To take the long view in defining goals, and, by communicating information, to fortify the company against adverse movements and misunderstandings which may arise along the way. (p. 53)

More specifically, there are many ways in which corporate social responsibility contributes to

reputation and business results, most commonly recognized by the tangible benefits it provides employees, customers, and investors.

The common benefits employees receive are improved employee recruitment, retention, and motivation. Companies perceived to have strong commitments to goodwill practices often find it easier to recruit and retain employees, and thus have less turnover and associated recruitment and training costs. Even in difficult labor markets, potential employees evaluate a company’s performance on acts of goodwill to determine whether it is the right “fit.” In fact, more than half of MBA students would accept a lower salary to work for a socially responsible company.

Beyond employees, it is necessary to understand the role of customers, who serve as the foundation for a corporation’s existence in the first place. A number of studies have suggested a large and growing market for the products and services of companies perceived to be socially responsible. While businesses must satisfy customers’ key buying criteria, such as price, quality, availability, safety, and convenience, studies also show a growing desire to buy, or not buy, because of other values-based criteria, such as being “sweatshop-free” and “child-labor-free,” having lower environmental impact, and not having genetically modified materials or ingredients.

Corporate social responsibility is also useful in attracting investors, partly because of a perceived lower level of risk attaching to companies that make socially favorable decisions. Not only do socially responsible companies actually have better financial results, they also appear to have an advantage when it comes to attracting investor capital. However, a corporation must consider how to conduct corporate social responsibility correctly by evaluating where it stands on CSR, where it eventually hopes to be, how it can get there, and how it can show results. To answer these questions, the corporation will need to consider a number of factors, including the regulatory framework the company is facing and the broad public policy issues that are driving the framework. After a company has a clear overall goodwill vision and mandate, it becomes possible to set specific targets and prioritize business activities.

When a company decides how to achieve the desired results, it must identify new ways to reach stakeholders that may have been overlooked in the

past, using new partnerships, diversity marketing programs, or other approaches. In some cases, it may be necessary to create full-fledged educational, cause-related, and social-issues marketing campaigns. Dialogue, whether establishing it, building it, or enhancing it, is the common denominator in all these potential approaches. To generate the most impact from these initiated programs, a company must consider creating reports and disseminating information to stakeholders and key media and opinion leaders, who can help develop clear-cut internal and external communications plans.

There are many reasons why goodwill practices are necessary in today's business world. Not least of them is the fact that if practiced right, corporate social responsibility is substantially beneficial to business. "The steady building of good will matched by good deeds creates a substructure of strength that becomes valuable in times of crisis" (Hill, 1958, p. 57). By evaluating its current standing and strategies, a company can help maintain an appropriate standard of practice that adheres to acceptable measures of goodwill.

GOVERNMENT PUBLIC RELATIONS

In government, public relations professionals communicate the activities of the various agencies, commissions, bureaus, and executive and legislative branches, and build relationships with constituents. The Public Affairs and Government section of the Public Relations Society of America describes these professionals as being "responsible for communicating with various audiences on public policy or public safety issues." According to James Garnett,

in *Communicating for Results in Government* (1992), "because government decisions and actions often affect more people and with greater consequences, communicating in government tends to be more important and often more difficult than communicating in business" (pp. 14–15).

Since the 1913 passage of the Gillette Amendment, which prohibits government spending on "publicity or propaganda purposes designed to support or defeat legislation pending before the Congress" (mistakenly equating publicity with the larger functions of public relations), practitioners in local, state, and federal governments have used titles such as public affairs, public information, communications, constituent relations, and liaison. In government, then, public relations professionals function under James E. Grunig and Todd Hunt's (1984) public information model, since the primary function of public affairs officers is to inform their constituents. These professionals facilitate the free flow of information between the government and the people so that citizens are able to make informed decisions about public policy matters that affect them. Public relations practitioners in government work to achieve active support for and cooperation in policies and programs, advocate for the public to government administration, manage information internally, facilitate media relations, and promote community and nation building.

In the United States, the president holds the most clout in terms of attention to a communicator's message by the public and by the media. The president's press secretary and communications office are charged with the responsibility for conveying the president's policy, media relations (e.g., press conferences and media availability), speechwriting, building and maintaining legislative support, and handling issues and crises as they emerge, 24/7. Ronald Reagan, Bill Clinton, and Barack Obama have been considered the most masterful presidential communicators in recent history. Their effectiveness has been credited to their engaging speaking style, excellent speechwriters, and savvy media handling. The press secretary is the chief public relations spokesperson for the administration and has the difficult task of interpreting the president's positions, decisions, and activities to the ubiquitous media. Reagan and his advisors followed seven principles in their media relations: plan ahead, stay on the offensive, control the flow of information, limit reporters' access to the president, talk about

the issues the president wants to focus on, speak in one voice, and repeat the same message.

The most influential public relations voices in the U.S. federal government charged with informing constituents, other than the president, have been in the Department of State and Department of Defense. In 1999, the United States changed its process for managing information flow overseas when the United States Information Agency (USIA) came under the State Department. It was believed that the agency, which functions to explain and support U.S. foreign policy and national interests through overseas information programs and cultural and educational activities, would improve and expand the State Department's activities with its strategic approach to diplomacy, ties with non-governmental organizations, open communication, and facility in digital media. Since the war on terrorism, the USIA's functions have been modified to meet the challenges of supporting democracy globally, supporting the war on drugs in producer and consumer nations, developing worldwide programs to address environmental challenges, and supporting free, truthful expression in all societies. The Department of Defense public affairs activity is aimed at boosting personnel and public opinion about the armed forces, procuring financial support for its programs, and maintaining public understanding and support. Each service has its own mission and staff, and the American Forces Information Services (AFIS) promotes cooperation among the branches and maintains the radio and television operations.

Not only does the public affairs function exist in a democratic system to report government action to citizens but it also ensures active cooperation with programs and encourages citizen participation and support. To the extent that a nation's media enjoy freedom from government control, elected and appointed officials are able to stay in touch with societal needs, and public affairs professionals are able to do their jobs responsibly and in response to these needs. Public affairs practice also promotes community and national development and regional and global interdependence. For example, U.S. Department of Health and Human Services public affairs officers worked cross-culturally and with multiple agencies in resettling thousands of Hmong refugees from camps in Southeast Asia. Internationally, government public affairs and

public diplomacy are critical to effectively manage 21st-century challenges such as environmental threats, health dangers, war and peacekeeping, and political tensions.

The efforts of public affairs practitioners who work to build and maintain government and citizen relationships are hampered by questions concerning the credibility and ethics of practitioners and those whom they represent. Questions of ethics and other factors such as citizen frustration and a sense of a lack of power to influence government also lead to public apathy, another hindrance to achieving public affairs goals. Finally, the hostility of legislators toward the public affairs function and information activities prevents the accurate accounting of costs and corporate value and achieving maximum effectiveness.

GOVERNMENT RELATIONS

Government relations is a public relations function organizations—both for-profit and nonprofit—use to strategically influence the public policy aspects

of their environments. Corporate participation in shaping public policy can be traced to the business barons of the early 1900s. Since that time, business organizations have struggled with appropriate ethical and strategic responses to unprecedented changes, constraints, and challenges in their environment brought on by government policy decisions. Large and small organizations can build relationships with government officials.

Scholars from such fields as political science, futurism, business management, public policy, communication, public relations, strategic planning, management information systems, and business ethics have advanced the field's understanding of government relations. Communication efforts by government officials have a historical place in the public relations literature, including undergraduate texts that narrate public relations' history. Such descriptions recognize the value of the relationships between organizations and governments, which began more than 50 years ago. Historian J. A. R. Pimlott first linked public relations, government relations, and democracy, a case Ron Pearson used in 1990 to examine the relationship between democracy and public relations.

Why are the offices of government an important public for organizations? Richard E. Crable and Steven L. Vibbert (1985) argued that organizations do not have authority in public policy. Rather, organizations have the ability to *influence* public policy. That is, organizations, whether profit seeking or not for profit, need to participate in the multiple state and federal arenas where "public policy is being decided" (Ewing, 1990, p. 24).

The importance of government as an organizational public has been addressed in the management literature. In 1983, Henry Mintzberg viewed government as one of the most important external publics with which an organization must engage because government officials "represent the ultimate legislative authority of the society . . . [and] establish the rules—the laws and regulations—within which every organization must function" (p. 44). The management literature identifies government as a public to be researched, monitored, and regularly engaged through communication.

Barry Jones and W. Howard Chase (1979) are credited with innovating the systematic approach to explain how organizations can legitimize and validate organizational positions on relevant public

policy issues. Government officials were considered one of the three major targets (business, citizens, government) of communication for strategic management. The authors encouraged organizations to "increase efforts to anticipate social change and respond to reasonable public expectations" rather than wait for others to set the public agenda (p. 11).

In Jones and Chase's initial conceptualization of issues management, issues precede government policies and organizations should "react" to events and be ready to proactively guide issues in the direction of favorable outcomes. Crable and Vibbert acknowledged that business, citizens, and government are not coequal publics for organizations; rather, "public policy rests where it has for more than two hundred years—in the halls of government" (1985, p. 4). Indeed, the authors concede that even in the lower levels of state and local government, the need for government support for organizational decisions is clear. Robert L. Heath and Kenneth R. Cousino acknowledged in 1990 that organizations must communicate with government officials as key stakeholders to influence and benefit from favorable public policy decisions. Their advice for issue managers is clear—organizations need to know the relevant "persons who create law or ordinance that prescribes which actions are rewardable or punishable" (p. 28).

Organizations can enact certain steps that will ensure that they have the information necessary to conduct government relations. The first step is for organizational leaders to know the legislative agenda in the different arenas of government. Local, state, and national bodies all have individual, although sometimes overlapping, agendas that may affect an organization. Organizations should conduct environmental scanning to identify which policy issues will be salient in each government arena. Legislation normally progresses through various stages to become the law of the land. One is the prelegislative stage of deliberation, during which the prevailing forces attempt to craft bills that may sustain themselves in legislative debate. Hearings are a crucial element in this phase. Legislation progresses to become bills, which are signed into effect by executive authorities. Regulation is created to implement legislation. All of this may end up being litigated before finally becoming the enacted law. Government relations is relevant at each step.

Once an organization knows the legislative agenda for a body of government, the second step is to explore how the acceptance or rejection of a policy may affect the short-term and long-term functioning of its organization. Government decisions influence such diverse organizational practices as competition, mergers and acquisitions, employment, licensing, access to scarce resources, retirement procedures, and financial investments. The public relations department should speak with other organizational units to see how these potential policies will affect the different subsections of the organization.

A third way that organizations can enact government relations is by gathering, organizing, and disseminating background information that shows the organization's position on the policy. White papers and position papers can be created to provide background to government officials detailing how proposed policy decisions may influence constituents. Often the public relations department will not need to collect new information; rather, it will need to be able to summarize large amounts of intraorganizational information into easy-to-understand, jargon-free background that can be used by government officials as they deliberate.

Information is only one part of the relationship-building process with government officials. Fourth, organizational members will need to establish an interpersonal connection with elected officials. It is recommended that organizational leaders set up appointments and meetings to develop face-to-face relationships with officials at various levels of government. Organizations have several tactics by which to foster this type of rich communication with their elected officials. They can invite political leaders to their organizations, have key organizational members attend political fundraisers, or have organizational members participate in advisory bodies that report to elected officials. Building relationships with government officials takes time and energy, and access to high-level government officials may require multiple attempts before anyone from the organization actually sits down to talk with a government official.

Another way to increase the visibility of the organization is to combine government relations efforts with lobbying and issues management efforts. This convergence of mission and message will create a comprehensive and synergistic strategic communication program. Open communication is needed

within an organization to ensure that the lobbying efforts are in sync with other strategic efforts.

Finally, organizations should join their respective trade or industry group to maximize their influence. Most governmental policies will not merely affect just one organization, but instead will affect whole industries. Industry groups allow competitors to cooperate with each other to ensure the future of their group. Industry groups often have resources to conduct comprehensive government relations efforts that benefit all members. At times, organizations may also want to partner with activist groups or organizations outside of their trade group to better communicate broader objectives and needs to government officials.

It is important to note that government relations are also very important in international public relations. Successful public relations efforts aimed at governmental publics require more than merely targeting particular officials. Effective public relations must also consider the unique social, economic, and political conditions of a nation. As the economic and social status of nations throughout the world changes, the offices of government may become the target of international public relations efforts. The developing world is rapidly moving toward privatization, as the impetus for economic development shifts from national governments to private sector corporations or to some hybrid ownership. During this time of transition, government offices are emerging as especially powerful publics to the corporations that want to participate in and benefit from the economic opportunities. One task for international public relations practitioners is to successfully build, maintain, and change relationships with key foreign government officials.

GRAPHICS

Graphics are visual elements used to create images for print publications, videos, and websites. The term is often used in a generic sense and can encompass a variety of visual elements, such as photographs, illustrations, drawings, clip art, line rules, typefaces, and tint boxes associated with the design and creation of printed or electronic materials.

Graphics are a powerful way to communicate in today's visually oriented society. Most printed publications and electronic layouts need strong, dominant visual elements to make them more interesting to the reader. Graphics can accompany copy to help attract attention, unify a look, convey special meaning, and add impact. They can also clarify, educate, and improve readability. Graphics are pieces of art used to express ideas, create a mood or image, and enhance the attractiveness of a piece.

Public relations practitioners use graphics to create identity systems for an organization. An identity system includes the implementation of the organizational name and logo throughout the materials produced by the organization, such as letterhead, business forms, brochures, invitations, and advertisements. Practitioners also use graphics to produce just about any communication tool, including newsletters, signs, posters, press kits, and websites.

Graphic design is the artistic and skillful application of type, color, and images to paper or another medium, such as a website, to create a clear and appealing whole. Many specialists work

with the creation and production of graphic images, including art directors, graphic artists, and graphic designers, and they comprise an entire industry of professionals involved in the design and printing of messages. Graphic designers, for instance, are professionals who design and may even coordinate the production of a printed piece, including selecting typography, art, paper, and ink. They work with public relations practitioners to ensure that the communication tool, whether a website or a printed publication, is visually appealing. A graphic artist is an individual who produces art through graphic methods, such as painting, etching, drawing, and the use of specialized software programs. Public relations practitioners work with these specialists to create materials with graphics, such as brochures, corporate identity systems, websites, and advertisements. Public relations practitioners who work in this capacity serve as print brokers because they hire illustrators, graphic designers, artists, and printers to help produce their work.

As any type of pictorial matter in a publication or other medium, graphics can include original illustrations and clip art; photographs; logos and symbols; graphs, charts, and maps; numbers; and visual elements such as bullets, line rules, borders, screens and tint boxes, typographic ornaments, geometric shapes (bars, stars, diamonds, hexagon), and enlarged letters. Clip art includes images in many different forms, such as photographs, illustrations, and typefaces that are generated by professionals. Clip art can be purchased online or is available free on some websites. Typically not created for any specific use, the art is generally copyright free. Public relations practitioners need to be aware of the U.S. Copyright Revision Act of 1976, which states that those who use copyrighted work must have the permission of the copyright holder. Even though some work graphics may be in the public domain, other images may be protected by copyright even if a copyright does not appear with the graphic.

When public relations practitioners need graphics that are more tailored to their needs, they may use the services of stock image providers or photo banks. Much less expensive and time consuming than hiring a photographer and orchestrating a photo shoot, photo banks offer a wide variety of subjects, themes, and styles, which can be accessed online and delivered digitally. Royalty-free images

are purchased for unlimited usage at a flat fee, but they can be accessed by other users, including competitors. Rights-protected images can be used for a particular use and period of time.

GROSS IMPRESSIONS

Gross impressions are widely used in program evaluation to indicate the number of people potentially exposed to a media message. These numbers are based on circulation figures for print media and ratings figures for broadcast media. Gross impressions are calculated by multiplying the number of messages that appear by the appropriate circulation or rating. The gross impressions number can become very large, very quickly; however, it must be used with care. The main caveat that should always be stressed is that these are potential exposures, not actual numbers of people who read, viewed, or heard the message. The classic example is Super Bowl commercials. Air time during the game sells for very high sums based on the potential audience exposure. But people are known to do many things during commercial time aside from watch the commercials (for example, go to the refrigerator or restroom). Thus, actual exposures are typically lower (and sometimes greatly so) than gross impressions for TV messages. The opposite might actually be true of print media. One newspaper in a library or periodical in a doctor's office will likely have far more than one reader. And with the current proliferation of cafés in bookstores, countless newspapers and periodicals

are read but not purchased. Thus, circulation figures can actually underestimate the number of people exposed to a print message.

Another problem with the gross impressions number is that although it may provide some idea of the number of people exposed to a message, it says nothing about whether those exposed were part of the actual target audience. This issue is partly addressed by choosing appropriate media placements, but few media sources, especially major outlets, provide the precise targeting public relations often desires. One way to ameliorate this problem somewhat is to develop an overall promotion and publicity effort that generates a "buzz" about a topic. For example, movie promotion is very involved these days. Trailers and product tie-ins create awareness and anticipation. Then a star hits the talk show circuit to talk about what she's doing in her life and just happens to mention her latest movie that opens in a few days and has a clip or two from it. People who like the star and are thus likely to go to the movie see the interview on *The Tonight Show With Jay Leno*. They will talk to friends at work the next day, and those people may well be more inclined to watch the star on the *Late Show With David Letterman* the next night. The overall promotion effort thus enhances the impressions generated among the most desirable audience members.

Finally, simple exposure says nothing at all about the impact or effect of a message. Use of the gross impressions figure alone is very misleading as a measure of the effectiveness of public relations activities. Meaningful program evaluation must always measure impact, not simply potential.

GUERRILLA MARKETING

Guerilla marketing was introduced in 1984 by Jay Conrad Levinson as a marketing strategy for “achieving conventional goals . . . using unconventional methods” (n.d., p. 1). An alternative to mass advertising via television, radio, and other mass media outlets, Levinson says it usually involves an in-person or on-location marketing stunt or tactic to raise product or organizational awareness. Guerilla marketing is also marked by inexpensive alternatives to mass marketing for specified reach and efficiency.

Levinson originally touted it as an inexpensive alternative for small businesses with limited resources. Guerilla marketing is designed to attract attention and create memorability among target markets while saving marketing dollars. As such, guerilla marketing is a precise activity, in which marketing expenditures are calculated and dedicated to activities that will earn the best low-cost reach.

Levinson (2007) stated that the foundation of guerilla marketing is that marketers “do not rely on the brute force of a marketing budget . . . [but] the brute force of a vivid imagination” (p. 5). Emphasis on creativity challenges traditional marketing efforts to seek creative yet cost-effective solutions to marketing problems.

Guerilla marketing features a small business rather than big business solution to marketing problems, dialogue over marketing monologue, priority on profitable relationships over sales, placing the focal point on the customer’s involvement and takeaway in the marketing effort, the integrated marketing effort over a single advertising campaign, consensual and permission-based marketing over mass distribution, and a focus on the individual over the mass.

Tenets of Guerilla Marketing

Levinson considers guerilla marketing a mindset that includes cultivating an entrepreneurial vision, prioritizing marketing as a critical organizational function, focusing on customer needs, and valuing the integration of all possible marketing tools. It is often considered an Internet marketing phenomenon. Levinson (2007) advised that online marketing provides the “golden opportunity” for guerilla marketers because “interactivity is blended with action, connectivity, targetability, community, and economy” (p. 60). The Internet allows marketers to use on-location events as fodder for potential viral videos to be distributed via social media users, enhancing the guerilla values of efficiency, cost-effectiveness, and reach.

Warfare and Ethics

The term *guerilla marketing* continues the marketing tendency to embrace warfare terms (e.g., marketing campaign, marketing blitz, stealth marketing, ambush marketing, target audiences). Levinson and Al Lautenslager (2009) wrote that it may be described as a direct attack on a competitor’s market share by knowing the market, customer, and competitor “inside and out” and exploiting a competitor’s weaknesses by selecting “the most lethal marketing methods” that capture attention in areas where the competitor may not be currently engaged (p. 61).

Use of guerilla marketing efforts has raised questions of ethics and marketing boundaries. For example, Cartoon Network and Turner Broadcasting used guerilla marketing to promote the release of its movie *Aqua Teen Hunger Force* by bombarding Boston with unidentified, unmarked packages that contained a movie image. Because of the suspicious nature of the unexpected packages, the effort raised alarms from local authorities, who mistook the packages for potential terrorist activities.

The concept is used synonymously with other alternative marketing methods like stealth marketing, peer-to-peer marketing, viral marketing, street marketing, and buzz marketing. In fact, some complain that the broad nature of guerilla

marketing's terrain makes it difficult to define or limit conceptually.

H

HABERMAS, JÜRGEN, ON PUBLIC RELATIONS

Writing about “Habermas on public relations” seems ironic, because for Habermas advertising and public relations are strategic action and in his theory strategic action is nothing that fosters the good of society. However, his theory of communicative action provides public relations scholars and practitioners with useful insights into the normative rationality of public discourse.

Jürgen Habermas (born 1929 in Düsseldorf) is a prominent German philosopher and sociologist trained in the critical Frankfurt School. In his *Theory of Communicative Action* (1984/1987), Habermas provides a sociological theory of society and communication. The main topic in the book that relates to public relations is the distinction between two forms of rationality: participative communicative reason on the one hand and strategic (instrumental) communicative reason on the other. This distinction is in opposition to other sociologists, such as Karl Marx, Max Weber, and Talcott Parsons, who locate rationality in abstract social structures. Habermas assumes that rationality can only be found in the process of interpersonal communication (speech acts).

Although associated with the critical Frankfurt School and its rather pessimistic analysis of social structures, Habermas believed that through rational communicative action a society can be built that integrates different identities and different worldviews. Drawing on George Herbert Mead

and Émile Durkheim, Habermas developed his idea of communicative action: Through communicative action (as a process of mutual understanding), cultural knowledge is transmitted and renewed and through this process, social integration occurs and solidarity among the members of a society is built.

Public Relations as Strategic Action (Manipulation)

To highlight the concept of communicative action, Habermas examined its counterpart: strategic action. In his view, strategic action is characterized by a high degree of rationality and coordination through points of interest. The most important characteristic of strategic action is its commitment to success—with the help of strategic action an actor tries to augment the efficacy of influencing the decisions of a rational opponent.

Developing his theory, Habermas differentiated two types of strategic action. The first is open strategic action. Applied to the field of advertising and public relations, classic advertising can be counted as open strategic action: The sender wants to persuade the recipient to buy a product or a service. It is the senders’ egoistic interest to influence the buying behavior of the recipient. However, the recipient is aware of the senders’ intents. The second type is called concealed strategic action. Here, at least one of the actors involved behaves success-oriented but makes others believe that he or she acts communicatively. Habermas called this conscious deception or manipulation. Concealed

strategic communication can be associated with the image public relations developed, especially in the eyes of many investigative journalists. This version of communication can be viewed as “hidden persuasion” or “stealth public relations” that penetrates audience’s thoughts without their conscious consideration. In his *Structural Transformation of the Public Sphere*, Habermas (1989) argued that advertising and publicity as well as mass media have invaded and corrupted the public sphere.

Public Relations as Communicative Action (Rational Discourse)

In spite of his own characterization of public relations as strategic action, the pragmatic and linguistic foundation of his theory of communicative action and its idea of the “ideal speech situation” offer insights for public relations. Habermas confronted strategic action with communicative action, which has the goal of reaching understanding. Here, participants are not primarily driven by their will to enforce their interests but by harmonizing their plans of action in a process of finding a common definition of the situation. Habermas believed in the existence of human rationality that gets obvious in the procedural structure of human communication and language. Rationality is represented in understanding and consensus.

According to Habermas, rational discourse takes place in three worlds: the objective world, the subjective world, and the social world (Habermas, 1984, p. 69f). The idea of an objective world relates to the external nature (“existing state of affairs”) on which statements can be made. The subjective world is the internal world of the individuals that consists of individual experiences and cognitive processes. The social world consists of the social life that is regulated by values and norms. Habermas described the three worlds as a commonly supposed system of coordinates. Within all three dimensions, participants in the discourse are able to agree on what they may treat as a fact (objective world), as a norm (social world), or as a specific subjective experience.

Based on this concept of the three worlds, it is easy to recognize that Habermas’s idea of rational discourse focuses on interpretations; speakers (and receivers) can no longer readily assume that their

interpretations perfectly match the objective, social, or subjective world, but have to take into account the reality that their interpretations are contested by others. Based on this central understanding, rational discourse starts with one claim a speaker makes related to one of the three worlds. This claim is an interpretation, but is objective in the sense that everyone else can agree or claim a different interpretation. Thus, objectivity is transformed into a process of intersubjective transparency, a proof of claims in the three worlds.

This proof of claims is done in a process of four steps. First, discourse participants agree about the truth, the facts concerning the objective world. Second, they agree on the subjective truthfulness of each participant (honesty about the subjective thoughts and intentions). If both dimensions are settled, the participants agree on the normative rightfulness or the legitimacy of the speech acts (acting in accordance with mutually accepted moral standards). The fourth step or dimension is the intelligibility: each participant is able to use language and grammar correctly and assumes that the other participants are as well. To get a rational consensus on a definition of a situation and the coordinative action based on it, each discourse participant makes validity claims in all four dimensions. The moment a definition of the situation is established, all participants incorporate this definition into their lifeworld.

Communicative Action: An Ideal and a Desideratum in Public Relations

Habermas was fully aware that the ideal speech situation is an abstract construction of how discourse should occur—actual discourse is usually different. As basic rules of communication are often violated, discourse is used to repair the communication and the relationships between participants. In relation to the three worlds and the four dimensions of validity claims, Habermas distinguished between different types of argumentation, such as theoretical, practical, and explicative discourse. Within theoretical discourse and its cognitive-instrumental expressions, the truth of propositions is discussed. The practical discourse with its moral-practical expressions tries to clarify the legitimacy of action and the explicative discourse questions the intelligibility of statements. The validity claims

relating to trustworthiness cannot be clarified in discourse as the speakers cannot prove the truthfulness by arguments, but only by action.

The theory of communicative action is rarely used in academic public relations although the idea of communication symmetry and mutual understanding is widely accepted as a central goal of public relations. According to prominent conceptualizations of public relations history, mutual understanding and communication symmetry are the most recent stages of the (ethical) public relations developments. Works of Edward L. Bernays, James E. Grunig, Scott Cutlip, Allen H. Center, and Glen M. Broom place mutual understanding at the core of public relations. However, critical scholars like Jacquie L'Etang, Magda Pieczka, and Juliet Roper argue that these conceptualizations are not based on the idea of participative communicative action but on the idea of selfish strategic communication that only acts as if it were communicative action. With Roland Burkart's consensus-oriented public relations, at least one model exists that tries to apply Habermas's concept for the purpose of planning and evaluation. Burkart suggests that particularly in conflict situations, organizational validity claims are doubted and a structured communication process is necessary to find a common situation definition. This common definition of a situation can also be linked to rhetoric and symbolic approaches of public relations like Robert L. Heath's zones of shared meaning.

HAMMOND, GEORGE

George Hammond (1907–2003) led a remarkable life in the practice of public relations. He earned the reputation as the man who could make things happen.

The golden age of public relations began to shine during the darkest days of U.S. economic history, the Great Depression. At the Carl Byoir Company, a pioneer in the public relations field, the gold turned to 24 carat under the leadership of Hammond, who joined the firm in 1932 and retired as chairman of the board in 1981. The style and methods of the company, America's most successful public relations firm for 50 years, were never duplicated.

Hammond was a problem solver who worked directly with company CEOs to analyze the problems and the goals of their companies and then directed those challenges to his hundreds of employees across this nation and around the world. Those clients—more than 100 *Fortune* 500 companies—included BF Goodrich, Honeywell, Bendix, A&P, Hallmark, Johnson's Wax, and countless others. The accomplishments of those companies are legendary.

With every client of the Byoir organization, the contact was with the CEO, a far different method than exists today. Under Hammond's direction, it was the job of the Byoir executive to continuously inform the CEO of anything happening in his company, the nation, or the world that could affect his company and its clients. This access and close contact with the CEO of the client company prevented a host of problems that exist today.

This was not a spin company. This was not a company that made millions of dollars in profits or whose employees were the best paid in the industry. This was a company whose employees remained with the firm solely because Hammond created an atmosphere in which they could do their best work. He was a strategic thinker; a visionary who thought through the problems, devised the plan, chose the best man or woman for the job, and allowed them the freedom to do their best work.

He made things happen.

His parents, both well-known but not wealthy musicians from Brooklyn, provided love and support and instilled confidence, which carried Hammond to the heights of his profession, lauded by associates, clients, and peers worldwide.

His exposure from birth to the beauty of classical music and the visual arts continued throughout his life and produced a creative thinker. He continually expressed concern that the country's education formula did not acknowledge the need for more literature, art, and music.

In 1924, it took Hammond several trips from Brooklyn into New York City and eight tests in one day, but he persisted in pursuing a scholarship to Columbia. His persistence paid off with a full Pulitzer scholarship and \$250 annually in spending money.

Persistence became a way of life for Hammond. Throughout high school and college, he wrote sports copy for the *New York Sun*. After graduating from Columbia in 1928, he continued his sports career. He ghosted the Grantland Rice column, covered golf, and worked for a hotel chain in Cuba, where he met Carl Byoir. In 1932, he was hired by Byoir to manage a sports program at the Miami Biltmore Hotel to attract visitors to the empty hotel. Through his creative efforts, he filled the hotel in the depths of the Depression. He did the same for several other hotels on both coasts of Florida.

The company's tourism business grew through Hammond's expertise in sports; he utilized the press corps to publicize various cities, including Orlando, Coral Gables, and Sarasota, bringing attention to those areas as vacation meccas even in the darkest days of the Depression.

Ultimately, he was called to New York and given the responsibility of his first client, the BF

Goodrich Tire and Rubber Company. He remained associated with Byoir for nearly 50 years.

In 1978, he received a letter from Bert Johnson, an executive in Orlando who credited Hammond with putting Orlando on the map. He wrote,

What you did for Orlando in 1935 can never be questioned. You gave us new spirit, confidence and vision. You not only put our town's name in the newspapers around the country, but you showed us there was still hope. You came here among us and you turned on the light. (Johnson, personal communication, 1978)

As the years progressed, Hammond turned on the lights of many corporations. He turned on the lights of the Long Island Railroad when his genius as a strategic thinker, who did his homework, brought the company out of bankruptcy and saved 60,000 commuters from being stranded on Long Island with no way to get into the city. He did it without sending a word to any news media. He did his homework. He learned that the railroad, with no history of accidents for 100 years, had two in 1954 in which 80 people were killed. He studied the engineering reports. He learned that the railroad needed several million dollars to upgrade its equipment and the tracks.

He used a large easel bearing the headline "The Long Island Railroad is the worst railroad in the nation." On succeeding pages of the large easel he outlined the problems, how to solve them, and how much it would cost.

The easel made the rounds of Long Island and Pennsylvania Railroad executives and soon landed on Governor Thomas Dewey's desk. The governor called a special session of the legislature, and the needed money was provided by the State of New York.

In 1952, Hammond turned on the lights for more than 200 passengers of the streamliner train, "City of San Francisco." Trapped in Donner Pass in the High Sierras for three days, the streamliner had run out of food and heat, and both the U.S. Marines and the railroad had failed in rescue attempts. But Hammond applied his usual problem-solving skills and paid a skier to get a message to his New York office. Then things began to happen. The skier led the other passengers to the

warmth and safety of a nearby bar and grill. A letter of congratulations and thanks from the vice president of the railroad did not compare to the appreciation of the grateful passengers, who survived with little to eat and minimal heat over the 24 hours of the ordeal.

He turned on the lights at BF Goodrich when he convinced a board member to vote in favor of a financing plan approved by Goldman Sachs that would save the company from bankruptcy. The company had tried three times unsuccessfully to get the plan approved by the stockholders. Hammond was 29 at the time and had just arrived in New York from Florida. While others in the office—probably 10 at the time—looked for ingenious ways to solve the problem, Hammond looked for the largest stockholder and went to the source. The man refused to see him. He returned to the building when it was time for the stockholder's car to pick him up. He slid in beside him and in that 15-minute ride, Hammond convinced him that the financing plan was the best way to solve the problem.

The lights continued to shine as he worked with the new BF Goodrich president, John Collyer, who knew from his long experience in Europe that Germany was producing synthetic rubber. Collyer and Hammond convinced the government that the United States could lose the war without synthetic rubber and that this country must immediately start making tires from synthetic rubber. The government complied. When the war was over, Collyer, with Hammond at his side, went to Washington and persuaded the government to get out of the synthetic rubber business and sell the plants to private enterprise. To the surprise of everyone, the government complied. This is but one of the accomplishments directed by George Hammond that changed the way America lives today.

Hammond was a take-charge man who could and did solve problems when others had exhausted every plausible tactic. He was an adviser, a problem solver who directed a worldwide company of well-trained employees who utilized his problem-solving methods. A career that started modestly became a career filled with business accomplishments that changed the way this nation thinks. Hammond was on his way to becoming chairman of the board of Carl Byoir and Associates.

His firm was the only public relations firm that was departmentalized, with experts heading every department. Editor John Stahr edited and approved every piece of copy that was sent to news media, regardless of where the account executive was assigned at the time. This resulted in enormous respect from all the media, including *The New York Times*. A release from CBA needed no editing and was known to be accurate and well written.

The company never used a lobbyist during its entire existence and had no set formula for solving problems. Hammond thought that each problem was unique. He met with the CEO, determined the problem and the course he would take, then assigned the work to the best people for the job.

Although he was distressed with the business scandals of the early 21st century, he acknowledged that there were 17,000 public companies that were honestly run and said that their efforts would keep the country going.

The merry band of professionals who worked for Hammond at the Byoir Company were dedicated, happy people. They loved their work, and they admired the leadership of Hammond. They did not move from company to company. There was very little turnover.

Muriel Fox, executive vice president of radio and television for the company, said,

We thought there wasn't anything we couldn't do. George Hammond knew everything that was going in the company. He cared about race relations and predicted in the 50's that we must solve these problems or this country would have major problems in the cities. He was very focused in regard to human relations and brought in people to teach the executives about the wider world. He covered a broad span intellectually. (personal communication, 2003)

Fox realized the rareness of Hammond's character by his actions toward her career: "He promoted me to executive vice president of radio and television. He was the first in New York to place a woman in such a position" (personal communication, 2003).

Dick Truitt, another executive vice president, said, "After he retired and I had a difficult problem, I would go to a quiet place and say to myself, 'What would Hammond do?'" (personal communication, 2003).

His executive secretary of 30 years, Mary Apelian, said, "He was a lofty thinker who always presented me with a challenge. There is a lot that the exterior does not show of the interior" (personal communication, 2003). After he retired, he retained her as his secretary until his death. She worked for him for 50 years.

At 93 years old, when Hammond started coauthoring an autobiography, he said,

As I sit here on my 93rd birthday watching the birds fly south over the Mystic River, I contemplate a remarkable life that a kid from Brooklyn was fortunate enough to enjoy.

A short time ago, as I assessed this life, I realized the worth of many of the things I have learned and practiced during a 50 year career in the public relations business. As I think of the problems which face this nation today, I am firmly convinced that many of them could be solved if we could reach the people one on one, not by spin, but by thorough explanation.

For 50 years our job was to listen, to solve problems and to explain. We did that and we did it very well for such companies as BF Goodrich, Honeywell, Bendix, Hallmark, A&P, The Long Island Railroad, Johnson's Wax, various U.S. Cities and the United States government.

Everything we did and the way we did it was different from the method our colleagues used. We did not measure our success by the number of press clippings we could generate or the size of the bill we could present to the client. Our success was determined by this standard: did we solve the problem?

I have lots of time to read, think and evaluate. I believe there are three crises in this country today:

1. The attack on business
2. Ineffective treatment of our rising generation's education formula
3. The lack of participation in one of the greatest freedoms in this country: voting. We are not exercising the hard fought freedom of voting as less than 50 percent of the eligible population goes to the polls. (Orsborn, 2003, n.p.)

Hammond believed that an effective person-to-person program throughout the nation, such as the method used to make the nation aware of the

Children's Television Workshop, could be used to motivate the American public to appreciate that great freedom that our founding fathers envisioned for us.

Joan Cooney did not launch her idea for a television program for preschool youngsters until she had the guarantee of \$7 million in underwriting. Her budget for something that did not exist included an ice-breaking program that cost \$250,000 the first year. She retained Hammond's company to do the job. Hammond directed his executives to innovate. They remembered old ways and invented new ways to communicate and persuade. It took personal calls, handbills, sound trucks, and the enlisted support of hundreds of community organizations all over the country because some of those areas did not yet have television. Today, *Sesame Street* is still one of the most popular and watched children's television shows in the nation.

This is the quality of work George Hammond created and supervised. Hammond died December 4, 2003, 5 days after his 96th birthday.

HARLOW, REX

Rex Harlow (1892–1993), founder of the first national public relations association and the first national public relations research journal, conducted public relations short courses nationwide and was the first full-time professor at a major university to teach public relations classes. He also pioneered the application of social science research to the practice. He was born in Missouri, began his career in Oklahoma, worked nationwide from his base in California, and lived to within two months of the age of 101. He wrote more than 50 books, edited the Harper series of public relations

books (1939–1965), and recorded his story in the unpublished autobiography he typed between 1981 and 1984.

The youngest of 10 siblings, he moved to Oklahoma City at age 19 to work for brother Ernest at Merry Optical, where he got the idea of establishing better relations with optometrists. When another brother, Victor, founded *Harlow's Weekly*, Rex served as business manager and conducted opinion surveys. He used research findings to advise business executives and political candidates. The literary and political digest published from 1912 to 1940 was the basis for the development of Harlow Publishing in 1915.

Congress declared war on Germany in April 1917, and Harlow was appointed to the Aircraft Production Board. Following a successful campaign to “sell” the value of air power, he resigned to complete officer training. His book, *The Trail of the 61st*, was published in 1920, the same year he married Ruby Wilson. They had two sons and one daughter.

Harlow completed a B.S. at what is now the University of Central Oklahoma in 1934. A year later, while completing his master's degree at the University of Texas, he became a trailblazer in the emerging field of university relations. His book, *The University of Texas As I See It*, led to a doubling in legislative appropriations for the university.

When he headed back north of the Red River to work on a social sciences doctorate at the University of Oklahoma, the president of Stanford contacted him seeking the kind of help he had provided for the University of Texas. In March 1935, Harlow headed to Palo Alto where he completed his doctorate. His dissertation study included trips to 14 universities where he found deficiencies in university relations with businesses, professions, and government. The next year, Harlow began his eight-year tenure teaching courses in higher education administration and public relations at Stanford, and he preserved his bound lecture notes from those first public relations classes.

Harlow wrote that public relations needed some common basis for understanding what it is, what it can do, and what constitutes acceptable work in the field. In 1939, he organized the Stanford Institute of Public Relations for short

courses and conferences. With corporate sponsors and university connections in multiple states, this became the American Council on Public Relations. Within a decade, 150 lecturers presented 23 short courses to 3,400 participants. The Council also studied opinions and issues related to World War II and sent weekly reports to President Franklin Roosevelt and 125 other government officials. His book, *Public Relations in War and Peace*, was published in 1942.

Harlow resigned from Stanford in 1944 because the new university president opposed training in professional and technical subjects. He announced plans to launch a periodical, but he backed away from the idea when Glenn and Denny Griswold told him they were planning a reporting service on current trends and developments. In 1944, the Griswolds introduced a weekly newsletter, *Public Relations News*, and Harlow began publishing research in the *Public Relations Journal* a year later.

In April 1945, Harlow flew to the East Coast to meet with Pendleton Dudley, president of the National Association of Public Relations Counsel (NAPRC, New York) and George Meredith, president of the American Public Relations Association (APRA, Washington, D.C.) to discuss the possibility of merging. Harlow's council had 630 members. With 313 NAPRC members and 225 APRA members, that was a total strength of 1,168. More than two years later, in August 1947, at the Lake Shore Club in Chicago, Harlow and five other men worked four hot days and nights to bring the Public Relations Society of America (PRSA) into being with a proposed constitution, bylaws, and steps for incorporation. PRSA became operational in January 1948. The council's short courses and *Journal* continued as PRSA operations, and Harlow was the first chair of the PRSA Education Committee.

Convinced that social science research was the foundation on which public relations and its development rest, Harlow chaired the PRSA Commission on the Social Sciences in 1951 with \$10,000 grants from each of two of Harlow's clients. In 1952, Harlow launched the *Social Science Reporter*, a semimonthly newsletter, and he began coordinating annual social science seminars that convened in California for two decades. He preserved a complete set of the *Reporter* that was published for 20 years.

Harlow was active in Harlow Publishing until his move to California in the 1930s. Brother Victor and nephew Bryce remained at the helm of the company through the 1950s. Bryce was a congressional staff member, World War II aid to General George Marshall, and special assistant to President Dwight Eisenhower. In 1961, Bryce established the first Washington, D.C., office of Procter & Gamble. In 1981, when Bryce received the Medal of Freedom from President Ronald Reagan, he was known for developing corporate representation in Washington. In 1982, the Bryce Harlow Foundation was established to advance business-government relations.

Among many awards bestowed on Rex Harlow was the PRSA Gold Anvil for lifetime achievement in public relations. Writing about the future of public relations at the conclusion of his autobiography in 1984, he called for an increase in education, professionalism, and the philosophical base of ethics, morals, and ideals. "The future success of public relations will depend a great deal on its acceptance by the public," Harlow wrote, "on its professional identity and the credibility of its professionals."

HEARING

A public hearing is a forum held by decision makers, usually elected officials, to listen to various stakeholder positions on a piece of legislation. The public hearing is at the heart of the democratic process because any interested party can speak on behalf of the legislation. Citizens, not-for-profit organizations, and corporations have the opportunity to participate in public hearings. In most public hearings, some speakers

support a particular piece of legislation and other speakers voice their concerns. Public hearings ensure transparency in the decision-making process.

Different types of bodies hold public hearings. At the local level, town councils, city councils, and boards of commissioners meet to deliberate issues, such as zoning, new laws, and taxes. At the state level, elected legislators also hold public hearings about issues, such as education reform and the budget, that affect the entire state. The U.S. Congress, both House of Representatives and Senate, holds public hearings to solicit public comment on upcoming legislation of national and international topics.

Interested parties conduct research before participating in a public hearing. Data from reliable sources are needed to ensure that the arguments made in the public hearing are accurate and credible. Sources for data can include the U.S. Census, statistics from other communities/states, public documents, and information gathered through the Freedom of Information Act (FOIA). Another type of research involves gathering personal narratives about the people's lives that will be affected, either positively or negatively, by the proposed legislation. This research is as important as the statistics because it puts a human face on the bill or regulation. Both types of research help to create a persuasive argument. Finally, interested parties often research the positions of each member of the committee prior to attending the public hearing. Citizens and organizations can contact the offices of each member of the committee and ask for each elected official's position on the legislation.

There is a predictable process to most public hearings. Generally, decision-making bodies announce the times and dates for public comment on a particular piece of legislation. The announcement of the date and time of the public hearing is usually published on the decision-making body's website or in the local media. Interested organizations then can contact the appropriate governmental office and ask to be placed on the list of speakers. Individual citizens and organizations must provide the name and contact information of the intended speaker. Interested parties are given a date and time to appear in front of the committee. They are also given a time limit for their speeches.

Because speakers have limited time, in addition to writing a speech, each speaker prepares a written document. This document, in the form of a position paper or white paper, provides additional information about the speaker's position. Speakers submit a copy of this written document to the committee prior to speaking. Many speakers bring extra copies to hand out to media representatives and other interested parties. These written documents typically contain background, contact information, and the same statistics and narratives as the speech. Readers and media quickly scan the materials so it is important that the authors place the most important information at the beginning of the document, use bullets, and make the position paper easy to read.

In public hearings each speaker is called to testify before the deliberative committee. Speakers introduce themselves (name, home town, organizational membership) to the committee, thank the committee for their time, and read their formal statement. The committee members may ask the speaker questions; however, it is unusual for the audience to be allowed to ask the speakers questions. Committee members are usually addressed by their formal titles and are treated with respect during the speech.

It is important for all speakers to stay within their allotted time limit. At any public hearing, there could be dozens of interested parties seeking to speak about their position. Speakers who extend beyond their allotted time may be asked to stop and will be unable to complete their statement. Many speakers practice their presentations (often many times) and anticipate difficult questions from the committee members. If there are several interested parties sharing the same position on the legislation, they may want to coordinate in advance which person will make which argument. Although repetition can be persuasive, bringing a wide variety of arguments into the speeches supports the main points.

During public hearings, a level of decorum is expected from the audience. Members of the audience are expected to sit politely as speakers present their arguments. Clapping for like-minded speakers is considered inappropriate, as is making noise when a speaker presents opposing arguments.

Representatives from the media often attend public hearings. Speakers should be prepared to give statements to the media and answer any questions about their position. Interested parties can invite the media to attend and offer to speak privately to them about their position. The media representatives may ask speakers for additional information and this is an opportunity to further communicate the position.

When all interested parties had the opportunity to speak and after all of the committee members' questions have been answered, the committee adjourns for private deliberations. These meetings often are not open to the public. It is at this point that the public part of the public hearing is over. Interested parties can continue to communicate privately with their elected officials and provide additional written materials. Interested parties can also contact local media representatives to further explain their position. However, once the committee ends the public hearing phase of its deliberative process, there is no more space for public testimony.

The public hearing is one way that interested citizens and organizations have direct contact with their elected officials. The Internet provides new opportunities and challenges for contact. For instance, some cities are exploring using online citizen participation in the hearings. In other cities, they encourage speakers to sign up to speak at the meeting through an online registration form. Yet, online participation presents challenges as cities try to balance offline and online citizen participation.

Each community has a slightly different process for holding public hearings, but the general process is as explained. It is the right of individuals and organizations to speak out on issues that affect their community. The public hearing provides the opportunity for elected officials to solicit public comment as they make legislative decisions. An interested party can be successful if he or she is well prepared, anticipates difficult questions, and provides meaningful written support materials to decision makers.

HILL, JOHN WILEY

John Wiley Hill (1890–1977) was the principal founder of Hill & Knowlton of New York, the largest and most successful public relations firm in history. For about 30 years after World War II, Hill & Knowlton led the industry in billings, and journalists and other public relations practitioners routinely rated it the best in the business. It was the first public relations agency to expand successfully into Europe and other international markets, while at home, by 1959 the combined sales of its clients amounted to 10% of the gross national product. Moreover, Hill's influence and that of his top executives was greater than most other public relations counselors of the time. Hill & Knowlton officers routinely attended board meetings and served as part of the management team of the agency's clients, which included the steel, tobacco, and aviation industry trade associations. Hill & Knowlton was the agency others wanted to emulate from the 1950s to the 1980s.

Birth and Education

John Hill was born on November 26, 1890, on a farm near Shelbyville, Indiana, the third of four sons born to Theophilus Wiley and Katherine (Jameson) Hill. Growing up on a failing farm, Hill graduated from the public high school in 1909. He worked for local newspapers before joining the staff of the *Akron (Ohio) Press*. After about two years there, Hill left to study journalism and English at Indiana University. After two brief stints in school, he quit and returned to Akron, this time to work for the *Beacon-Journal*. In 1913, he and a friend founded the short-lived *Chicago Daily Digest*; a few months after it folded, he and another friend began publishing a paper in Shelbyville. It, too, collapsed, and he moved to

Cleveland to report again for the *Press* and then the *Plain Dealer*. Hill married Hildegarde Beck on June 19, 1916, in Cleveland; she was the daughter of the first conductor of that city's symphony. Hill's formal education apparently ended for lack of funds, but his entrepreneurial spirit continued to serve him well.

Early Public Relations Career

In 1920, Hill made a tentative step toward a career in public relations. He created a newsletter for local executives for the Union Trust Company in Cleveland, while also serving as financial editor for the *Daily Metal Trade*. This dual role led him to two important realizations: first, that many journalists were inept in reporting on financial news, and secondly, that most executives had no desire to deal with the press. In short, Hill identified a need for a "corporate publicity office," which he opened in Cleveland in April 1927. In 1933, he invited Don Knowlton to join him, thus creating Hill & Knowlton.

People who knew Hill believed that Hill & Knowlton's Cleveland accounts, including Union Trust, Otis Steel, Standard Oil of Ohio, and Republic Steel, had a tremendous impact on Hill's way of thinking and his approach to public relations. In his later years, Hill often reminded people of a banker or a statesman, and his quiet, conservative approach seems to have developed from his association with financiers and steel magnates, many of whom hated big government and organized labor.

Tom Girdler, Republic Steel's fanatically anti-union president, drew Hill & Knowlton into a wider world and into one of the biggest industrial controversies of the Depression. On Girdler's recommendation, the American Iron and Steel Institute (AISI) retained Hill & Knowlton in 1933, forming an association that lasted well into the 1970s. (Eventually this became the largest single public relations account in the world.) The agency developed institutional advertisements opposing union organization of the steel industry, defended Republic and other companies when the 1937 Little Steel strike resulted in violence, and represented the AISI during the Senate hearings that investigated the companies' actions during the strike. A Senate subcommittee of the Education

and Labor Committee, popularly known as the La Follette committee (its chair was Robert M. La Follette, Jr., of Wisconsin), even investigated Hill & Knowlton, because of a mysterious special fund that the agency kept on behalf of the steel companies. None of the companies that contributed to the fund received anything beyond a newsletter that all Hill & Knowlton clients received, and La Follette suspected the agency was involved with the antiunion “citizens committees” that had sprung up in strike towns, but the senator was unable to connect the money or Hill & Knowlton to anything illegal.

Although he often failed to see or understand the problems of the consumer or the worker, Hill had a strong appreciation for the power of public opinion. Because rational people ruled in a democracy, Hill asserted, “Public opinion is entitled to the facts in matters of public concern” (Hill, 1958, p. 63). Therefore, he explained, a good public relations program must be based on integrity, sound policies, and the release of information that the public could understand and believe. He was greatly influenced by Ivy Lee, whose 1925 book, *Publicity: Some of the Things It Is and Is Not*, Hill read and whose ideas he often repeated, particularly regarding the need for publicists to counsel their clients rather than simply taking orders.

Within a few years after its founding, Hill & Knowlton began to expand. Hill opened a New York office in 1938, moving there while separating from and later divorcing his wife. In 1944, he opened a Washington, D.C., branch to handle government relations for the New York and Cleveland offices. By November of 1945, the New York branch’s billings were double those of Cleveland, and Hill recognized that his future was in Manhattan. In 1947, he turned over all but 5% of his interest in the Cleveland office to Knowlton and established a separate agency, Hill & Knowlton, Inc. (Knowlton owned a small share in exchange for the use of his name.) Hill married for a second time, on December 2, 1949, to Elena Karam, and he adopted two children.

Hill & Knowlton of New York

Some of Hill’s Cleveland accounts—Standard Oil of Ohio, Warner and Swasey, and the Austin

Company—transferred to New York with him. The AISI and several other clients he recruited through the Manhattan office, most notably Avco Manufacturing and the Aircraft Industries Association, gave the new firm a presence in both the field of public relations and in big business. Although he had several corporate accounts, large trade association clients were Hill & Knowlton’s bread and butter.

The aviation industry campaign after World War II was typical of Hill & Knowlton’s trade association work. The Aviation Industry Association (AIA) sought a steady diet of military appropriations for its member companies, and it promoted air safety, travel, and other aspects of civil aviation. After the war ended, military contracts took a nosedive, so the agency focused on convincing the federal government to audit the nation’s air policies and its readiness for another war. When both Congress and President Harry S. Truman set up commissions to review air policy, Hill & Knowlton helped industry officials prepare their testimony and publicized the boards’ findings. Joining with the American Legion, the AIA sponsored a campaign, “Air Power Is Peace Power,” beginning in 1947. Working through the Aviation Writers Association, which had its headquarters at the AIA offices, Hill & Knowlton promoted the aircraft industry with journalists who specialized in aviation. Interest in flying was high, and in a three-month period in 1947, local media devoted almost 5,000 column inches to just one portion of the air power campaign. The AIA also mailed publications about aviation to opinion leaders, such as college professors, state legislators, ministers, and business leaders, and sent speakers to civic club meetings across the nation. Thus, Hill & Knowlton coordinated the efforts of the media and political and public interest groups to promote its client’s interests.

During the next two decades and because of the stature of its clients, Hill & Knowlton regularly took part in important public debates. It represented the steel industry, for example, in 1952, when President Truman seized the mills to prevent a strike during the Korean War, producing booklets, speeches, advertisements, and more than 100 news releases in just a few months, both opposing the workers and disputing Truman’s right to take the mills. In December 1953, the agency acquired

a new account, a group of tobacco executives responding to a series of medical studies that linked smoking to lung cancer and other diseases. Hill & Knowlton created the Tobacco Industry Research Committee, funded by tobacco farmers and cigarette manufacturers, to distribute grants for research on smoking and health and to promote the idea that the link between smoking and disease was not proven. The agency successfully convinced reporters to include its statements alongside those of doctors who condemned the industry's products in a growing body of evidence indicting cigarettes. (In 1969, Hill & Knowlton quietly resigned the account as its influence on industry policy dwindled.) Finally, the natural gas controversy of 1956 represented a major defeat for Hill & Knowlton, despite its best efforts. The agency mobilized corporations and individuals to fight federal regulation of the industry. It appeared to be headed for success after a favorable vote in the U.S. House of Representatives when a U.S. senator announced that two gas industry lawyers (not affiliated with Hill & Knowlton) had tried to bribe him. The bill still passed the Senate, but President Dwight D. Eisenhower refused to sign it because of the scandal. Hill & Knowlton also represented the pharmaceutical industry during the Kefauver hearings of the early 1960s, which were followed closely by many citizens as well as business leaders.

International Public Relations

Several factors contributed to Hill & Knowlton's move into international public relations. First, John Hill toured Europe for the first time in 1952, when he was 62 years old. He detected extraordinary potential for the field of public relations there. Additionally, several of the agency's corporate accounts, including Procter and Gamble and Texaco, were multinationals with interests all over the world, and Hill needed a new challenge. Hill & Knowlton was the largest firm of its kind and was already buying up smaller agencies and absorbing their client lists. (In the 1980s this trend accelerated among all the large agencies.) By July 1954, Hill & Knowlton developed a network of affiliated agencies in Britain, France, the Netherlands, and Belgium, and opened its own office in Sydney, Australia. In December of that year, Hill & Knowlton

sent an officer to Paris to establish its international headquarters. Hill traveled to Europe three times in three years, flush with optimism about his new venture, but not until 1958 did the international office gain its first big account: promotion of the 1958 World's Fair in Brussels. Although Hill & Knowlton International failed to turn a profit for almost a decade, Hill & Knowlton established a firm toehold in international public relations and further enhanced its reputation as the leading public relations agency in the world.

Innovation and Growth

Hill & Knowlton was a public relations innovator in many other ways. In the late 1940s, the agency hired Price Waterhouse to apply cost accounting and modern budget management practices to public relations, setting up a system of standard fees and staff-time charges. (Most agencies rather haphazardly set different rates for different clients.) The agency also established stock purchase and profit sharing plans for employees, effectively minimizing turnover. It created educational programs for public schools and developed extensive community relations programs for companies and industries. In 1966, it established an Environmental Health Unit to work with corporate clients on pollution and other environmental issues. Other specialized departments included women's interests, press relations, radio and television, graphics, and technical writing. Hill & Knowlton also experimented with new kinds of public relations research and with the use of computers during the 1960s.

In 1966, the agency listed 42 domestic clients and 15 international accounts, many of which were prominent in national and world affairs. In addition to the steel industry, trade associations included the American Petroleum Institute, Lead Industries Association, Licensed Beverage Industries, and the Tobacco Institute (a successor organization to the Tobacco Industry Research Committee). Corporations included Allied Chemical, Ernst and Ernst, Gillette, Marathon Oil, Procter and Gamble, and the Union Pacific Railroad. It even represented the American League of Major League Baseball. Internationally, such groups as Alcoa, the Hong Kong Chamber of Commerce, Hughes Aircraft, and World Airways retained Hill & Knowlton.

Hill & Knowlton's staff also made an impressive testament to the agency's leadership and reputation in the field. A 1963 survey of its talented employees showed that the average staff member had 15 years experience in public relations and at least three out of four of the employees had worked in journalism. They had written 44 books and had published articles in more than 100 publications. Hill himself wrote two books, made dozens of speeches, and wrote numerous articles for the trade press. Among his staff, three held doctorates; several were attorneys; one had won a Pulitzer Prize. Of those employed in the United States, their language skills were impressive: 33 could read or write French, 19 fluent in German, 18 fluent in Spanish, and others spoke Russian, Italian, Arabic, Greek, and Dutch. At Hill's death, Hill & Knowlton boasted 560 employees scattered among 18 offices overseas and 36 in the United States.

John Hill consciously set up an agency that would outlast him, designating a line of succession. Beginning in 1960, he gradually withdrew from day-to-day participation in account management and reduced his personal holdings in the agency. He retired as chairman and CEO in 1962, although he retained his corner office until his death. Hill & Knowlton's reputation for integrity and professionalism, however, was based largely on Hill's personal reputation among business leaders and other public relations executives. After he died in New York City on March 17, 1977, executives found it increasingly difficult to balance growth with ethical performance. Still, with its combination of size and endurance, Hill & Knowlton represented a new kind of public relations consultancy.

HISTORIES OF PUBLIC RELATIONS

Scholarship in public relations history has made great strides in recent years, broadening and enriching its areas of focus. Building on the contributions of oft-cited scholars, such as Scott Cutlip, Stuart Ewen, N. S. B. Gras, Ray Hiebert, Roland Marchand, Ron Pearson, J. A. R. Pimlott, Alan Raucher, and Richard Tedlow among others, the body of knowledge includes studies of people, events, and organizations of significance to the field as well as theoretical and historiographical analyses. The literature also reflects an expansion beyond corporate and periodization orientations into more inclusive and culturally contextual perspectives from around the globe.

Corporate

Karen S. Miller (2000), in finding that the public relations history body of knowledge includes a number of studies grounded in business history, pointed to a growing body of work that is more inclusive of marginalized others, adds to theory, and contradicts some of the conclusions made in those corporate histories (e.g., public relations is not just a top-down tool of the elite, but also of the grassroots, bottom up). Scholars now routinely examine activist groups, nonprofit organizations, government, education, religion, politics, and professional associations, among others, outside the world of business.

Periodization

As early as 1941, Edward L. Bernays offered a version of periodization to describe and explain

the development of public relations. Others have followed with elaborations or alternatives, but most of them mark the work of P. T. Barnum as a significant catalyst for the field that then evolves from bad to good over time, culminating in a state of ethical and professional practice in the 20th century.

Scholars argue, however, that the effect of periodization has been to hinder the growth of the body of knowledge. For example, Oliver Raaz and Stefan Wehmeier (2011, p. 266) found that many of the models are not globally applicable but are “trapped in the paradox of the modern concept and the ancient beginnings.” R. E. Brown (2003) also identified this paradox and concludes that it challenges the idea of a progressively more ethical practice. Additionally, Margot Opdycke Lamme and Karen Miller Russell (2010) pointed out that periodization models are not able to account for considerations within historical time and place, such as terms employed by historical actors, activities that integrate persuasive tools, or broader historical contexts. Instead, they suggested that a theory of public relations history should be based on motivations (an explanation of the reasons that public relations functions are employed), after finding out that before 1900, the common drivers behind such efforts emerged as profit, legitimacy, recruitment, agitation, and advocacy. David McKie and Debashish Munshi (2007, p. 130) called for a departure from empirical influences and suggested venturing into other fields, such as international relations, as well as into other historiographic “pattern[s],” such as class, women, and postcolonialism, to enrich public relations history and to ensure more inclusion. Günter Bentele (1997, 2010) proposed five functional-integrative strata to explain how the field developed within broader social and cultural contexts: interpersonal, public, and organizational communication, and public relations as an occupational field, and then as a social subsystem.

Global

In addition to expanding beyond the corporate and periodization traditions, scholarship has moved beyond the idea that public relations is a distinctly American phenomenon. For example, in her study of 20th century public relations in

Britain, Jacquie L’Etang (2004) traced the field back to 1906 and to the national trade union for local government public relations officers. Her work demonstrates the value of departing from a corporate framework and the importance of integrating cultural, political, and socioeconomic contexts into historical analyses.

A significant effect of these and other approaches to expanding the public relations body of knowledge is an embrace of topic areas previously left unexamined or outright rejected, such as the relationships between and among public relations, propaganda, power, democracy, and religion as well as an embrace of methods that complement or replace traditional archival work, such as critical and qualitative approaches.

Another effect of this expansion is an increase in public relations historians, many of whom have an insider perspective and use this expertise to enrich the historical analysis of the field. Finally, public relations history is now in better alignment with professional practice. That is, scholars are not confining public relations to a mass-mediated function, but extending it to include a range of interpersonal, public, controlled, and uncontrolled communication strategies that are employed alone or in concert and that unfold in broader contexts within and outside of communication disciplines. Scholars are moved to consider global sensibilities, culture-specific contexts, inclusion, historiographical alternatives, and interpretation that goes beyond the descriptive to the explanatory.

HOLD AND HOLD FOR RELEASE

Press releases are among the most used public relations tools. They are an efficient means of disseminating information to the media and are relied on heavily. Generally, the information contained within press releases may be used by media outlets

on receipt. To make editors aware of this situation, the term “For Immediate Release” is found near the top of the release, usually in the upper right- or left-hand corner of the piece.

However, this is not always the case. In cases of sensitive information or to coordinate events and efforts, practitioners may send releases before they should be used to media. In these situations, the information is embargoed, meaning that a specific date and time are given for when the information can be used; editors are asked to hold it for release until then. To signify this, the term “Hold for Release” and specific release information, such as time and date, appear in either the upper right- or left-hand corner of the piece.

Most editors respect these requests and do not publish the information until appropriate, but public relations practitioners have no guarantee of this and have no recourse if an editor chooses to run the information before the embargo ends. Therefore, it is imperative for practitioners to be careful in releasing information that should be held for release. There are advantages to this practice as well. By sending the releases before the publication time, public relations practitioners attempt to pique the interest of editors and reporters. With the advance notice, the media can develop more complex and in-depth articles about the subject without the pressure of deadlines. With the advent of instantaneous transmission of news in today's society, it is thought that hold for release documents and embargoed items will soon be relics of the past.

HOME PAGE

A webpage is a computer file that is stored on a computer server in such a way as to make the file available to other computer users via the Internet. Webpages can contain a variety of formats and types of information, including text, pictures, audio, and video.

Webpages are usually written in HyperText Markup Language (HTML), or eXtensible HyperText Markup Language (XHTML), and are uniquely

identified by a Uniform Resource Locator (URL). An example of a URL is `http://loc.gov`.

Not all URLs contain *www*, which leads to a minor, but important distinction. The terms *Internet* and *World Wide Web* are used interchangeably, when in fact one is a subset of the other. All URLs starting with `http://www` are part of the World Wide Web, which is a subset of all URLs making up the Internet. The inclusion of *www* does not make a webpage any more (or less) accessible. All URLs start with `http://` (the *http* stands for HyperText Transfer Protocol, the protocol needed to make full use of HTML/XHTML files across a network).

A home page is simply the top level or *gateway* page for a website. A website is simply a collection of webpages that are linked together. Creating webpages in HTML allows a person to program the links into individual pages as they are created. Any content in a webpage can be linked to any other content in any other webpage. Or if a page is particularly long, links can help a user to navigate the page more quickly.

Webpage creators typically use three different ways to let users know when something on the page is linked: (1) A different color can be used for the linked text, (2) the text can be underlined, or (3) both methods can be used. In all cases (meaning all data types, including text), when the mouse cursor is passed over the linked material, the shape of the cursor changes, typically into a pointing hand.

The presenting and organizing of information in a webpage format has both advantages and disadvantages. An advantage is that webpages allow a content provider to structure and organize information in a nonlinear arrangement, consisting of text, pictures (moving and still), and video. Because no two people process and consume information in the same way, a webpage allows users some degree of control over the order and method to receive the message.

This is also a disadvantage. Webpage creators have to be familiar not only with ergonomic issues (where to put what information so it is easy to scroll to and access on a page) but also with communication theory, logic, and information flow, so information is not “lost” simply because it was not put where a webpage user expects.

Another disadvantage is inherent in the technology. The creation of the HTML and associated

technologies was created with the idea of making the flow of information as unrestricted as possible. The technology is now exploited by hackers, who embed destructive code in a webpage and wait for an unsuspecting visitor to the webpage to click on (and activate) the malicious code.

Despite the disadvantages, organizations seeking to engage in public relations are wise to have a presence on the Internet. A home page serves as a communication channel that is available 24/7 and allows interested parties the opportunity to follow and communicate with the organization from anywhere in the world with Internet access.

Organizations can create and use a website to serve as a repository of information: annual reports of various kinds, collections of past and current media releases, and the history of the organization as well as its mission and vision. Financial information—for businesses as well as nonprofit organizations—can be listed and updated. Websites can offer pictures and audio statements that make the people of the organization seem less distant. Such sites usually include a location for FAQs (frequently asked questions).

There are also marketing advantages. Customers can acquire product and service information and possibly make purchases. A home page can allow open- and closed-end customer feedback and allow customers to ask questions about how to use a product or service. Webpages are replacing 1-800 customer service hotlines as the most useful means to make product inquiries.

Also, webpages offer reporters access to media releases, which are sometimes embedded with a password prompt that allows them to seek additional information about a story. Discussion areas (chat rooms) can be created, as a forum to discuss and debate relevant issues.

HOTLINE

Hotlines provide customers and concerned citizens easy access to seek information or express opinions to businesses, government agencies, and

nonprofit organizations. Hotlines originated as 1-800 numbers to replace personal letters from customers who wrote to obtain information or express concerns. Savvy businesses realized that customers might wish additional information about products or services. So hotlines were established to make it easy for a customer to call an expert to seek advice on the use of a product or to solve a problem relevant to a product or a service (e.g., insurance policies). Government organizations and nonprofit organizations soon recognized the virtue of this kind of constituent contact.

This public relations tool started with the telephone and migrated to online status. For instance, today a customer is likely to find useful information on a home page, in a chat room, or through a “contact us” link.

Hotlines play a vital role in people’s lives. Imagine a young couple who is obligated to prepare a holiday meal for family members or friends—or both. Early on the morning of the event, for instance, the couple comes to grips with the reality that they have a very large, frozen turkey that is far from being easily and readily prepared for that delicious meal they imagined—based on their recollection of “Mom’s” holiday table. Now, the couple might call Mom. That would admit the truth that the couple is poorly prepared to deal with the realities of life at the holiday season. So why not call the company that harvested and sold the turkey? Or perhaps, it is wise to go online for advice. Should the package wrapping that plump turkey have a 1-800 number printed on it so that young cooks can talk to an expert regarding how to prepare that magical meal that appears so easy when Mom fixes it? Should there be a Web address printed there to expedite customer contact?

The reality of this type of public relations tool is that companies (and other organizations) are wise to make an easy and useful communication link with customers. Network theory advises that the easier information is to acquire, the more likely people are to obtain and use it to reduce uncertainty and feel a sense of accomplishment—self-efficacy. They feel empowered. More than merely customers, they are valued customers. Customer satisfaction is more than a buzzword; it is a commitment.

This public relations tactic can be used to ease communication with members, donors, activists,

media, employees, students—all stakeholders. Not only does the link allow for information to be sought but also for information to be provided and opinions to be expressed by the outsider. Concerned citizens need a number to call if they are worried about their health or safety because of a company’s operations. Government agencies can use the channel to provide as-needed information to citizens. At tax preparation time, for instance, the Internal Revenue Service can use this type of link to assist taxpayers. This is also a valuable tool for activist groups and other nonprofit organizations, by opening a channel for people to seek information and to voice concerns, and also can serve as a recruitment tool for new members.

If organizations aspire to be open, they need to facilitate that openness through useful communication channels. Organizations espouse the virtue of two-way communication but may fail to create a counterpart system to one-way flows. Another benefit is that channels of this nature give the organization an opportunity to conduct environmental scanning, looking for product- or service-related problems or community concerns.

Whereas the 1-800 number began the tradition of opening an organization to outsiders, computer technologies offer a 24/7 option. One such option is the frequently asked question (FAQ) feature at home page websites. Another is the chat room, where concerned citizens can voice concerns, see the concerns voiced by other citizens, and read the organization’s response. Customers can even find online instructions and video instructions to assist their use of and satisfaction with a product or service.

Online and telephone communication can be frustrating, as well as empowering. Hotlines can be frustrating when customers have to wait, encounter voices that are hard to understand, and be met with indifference. Online instructions can be vague and confusing. Some companies even ask other customers to answer questions in chat areas. So, the terrain of hotlines is not without landmines; cost-cutting approaches can be a liability rather than a benefit.

Whereas letters once were the sole link, this extremely impersonal and time-consuming process has given way to more modern and effective means for opening organizations to their constituents. Hotlines can help companies satisfy the promise to

be the first and best sources of information on all matters relevant to them.

HUMAN INTEREST

Human interest is a vital ingredient in making some event or situation newsworthy. Among the compelling questions journalists want to answer is “Who did something?” or “To whom did something happen?” The element of human interest enlivens a news story. A story becomes more appealing when it is about real people. It centers on their feelings and emotions. And, the same logic works for the human interest as reflected in other stories, such as the well-being of animals and the environment.

The human interest value of a story is captured in the news programming axiom: If it bleeds, it leads. If a story has human drama, pathos, it is going to satisfy audiences’ desire to see the human element of the news. News doesn’t just happen. It happens to real people—and animals. The ability of anyone with a cell phone to become a “journalist” only adds new challenges to this human interest element, including the possibility that events are staged or rights are compromised.

Meeting the human interest challenge separates the inadequate, adequate, good, excellent, and great journalists and public relations practitioners. Every practitioner is challenged to create media relations. Part of that challenge is to release to reporters the news and news tips that attract their interest because it is newsworthy. Newsworthiness is a strategic decision about the reader’s response, listener’s response, or the viewer appeal of the content and presentation of the news stories.

For instance, human interest is created when there is a news report that a child is missing from home. That story is made more interesting by noting the age of the child. A younger child likely generates more news value and human interest impact than an older child. The story has even

more human interest if the disappearance occurred under suspicious circumstances, if the child were blind, if the days are cold, or the child were lightly clothed—too lightly for safety given the lowering temperatures. If a storm were brewing, all those elements can add to the human interest narrative.

Thus, the details that enrich the drama of a news event add human interest. If a practitioner is trying to attract attention to some event, they are more likely to do so if it has human interest. Let’s reflect on a real-life situation. What if a practitioner working to gain attention for the grand opening of a department store or mall is confronted with a nuance, for example the mall or store catching fire near the opening date? The news releases are attempting to attract customers’ attention to the opening to increase traffic. But the fire diverts the grand opening. Announcing that the store or mall is about to open after the appropriate repairs have been made might be anticlimactic. What if the merchants pool resources and buy a Dalmatian puppy to give to the fire station that responded to the fire alarm? What if the merchants contribute money to a charity that is sponsored by the fire personnel and announced the gift? Would the new grand opening have more news value, more human interest, if associated with this tribute to the fire personnel who had risked their lives to extinguish the fire?

In the best sense, human interest is a vital part of each news story. One of the reasons people pay attention to the news is to learn about the impact of news events on people’s lives. For this reason, charities tend to build on the human interest, such as stories of needy families at Christmas, to increase the likelihood that reporters present the news and audiences receive the news. Used ethically with the best of intentions, human interest is a beneficial aspect of news and the media relations efforts of practitioners.

When used contrary to the above intent, human interest can exploit human feelings for no particular news value. It may appeal only to the darker side of the public’s interest in seeing something bad happen to people. This can be especially true of people who just want to pry into other people’s lives. For that reason, news reporting can focus on someone’s “dirty laundry” rather than on the positive aspects of a story. For this reason, celebrities

are subject to extraordinarily unfair reporting standards. What might be a family tragedy, such as drug addiction, becomes even more newsworthy if it is associated with the rich and famous. The lurid details and horrifying pictures can even be blatantly displayed in the tabloids at grocery store checkout lines.

Human interest is an important dimension of news reporting. Because of its connection with news reporting, public relations has a responsibility to understand and comply with the strategic and ethical dimensions of human interest as news value. Practitioners are guilty of unethical hype if they play up the human interest aspect of a story beyond what good judgment, responsibility, and taste dictate. Such self-serving displays of human interest can erode the news value of stories, harm media relationships, and turn off the public's sensibilities to fair and honest reporting.

On the opposite side of the coin, however, practitioners who represent certain clients must acknowledge that human feelings are a vital part of their stories. In some instances, such as a sensational kidnapping, a practitioner might try to protect the family from the prying eyes of reporters and audiences who want lurid details and raw displays of feelings that carry no real news value. By the same token, however, practitioners in service of the rich and famous must know that the public and reporters are likely to demand more details, however raw, of those clients who seem to climb the highest and fall the farthest.

Human interest is a two-edged sword of a news and public relations practice. It focuses attention on the human drama that is explained by narrative theory. Nevertheless, some elements of decorum must bring perspective to the personal aspects of

stories and the people who make them. The axiom that not everything is the news or newsworthy has substantial implications for those interested in human interest.

HYPE

Derived and shortened from the original word *hypodermic*, the term *hype* has varying definitions; however, most of them are negative. When referencing its formal denotative term in various online dictionaries, noun-based descriptions like “blatant or sensational promotion,” “a deception or racket,” and “an intensive or exaggerated publicity or sales promotion” are the type of analogous definitions located. Other verb-based descriptions included “to put on, deceive”; “to market or promote (a product) using exaggerated or intensive publicity”; “to publicize extravagantly” and “to falsify or rig (something).”

This term has long been used pejoratively to emphasize the discrepancy between statement and fact. Public relations practitioners' inclinations to overstate their cases lead to such denigration, an aspect of their reputation that motivates leaders to call for more precise and accurate statements.

IDENTIFICATION

In an age when people frequently communicate with a variety of organizations in their daily lives, the theory of identification offers public relations practitioners a strategy that companies and other organizations employ to influence audiences and build relationships with them.

Organizations engage in identification when they demonstrate how they share identities, values, and norms with audiences and publics. As so many organizations try to capture and keep the audience's attention, this strategic process of creating and communicating common ground is crucial. First articulated by Kenneth Burke, identification is a rhetorical concept that has become increasingly important in public relations as more organizations compete to garner the audience support needed for survival. Identifying with an audience consists of persuading them how an organization and they are similar. As Burke described it, "A is not identical with his colleague, B. But insofar as their interests are joined, A is identified with B" (1969, p. 20). Less overt than some persuasive strategies, without the ability to convince audiences of shared interests an organization's message is likely to fail. On the other hand, if people believe their views and beliefs overlap with an organization's, it is much easier to persuade them to approve an organizational message as that is akin to self-approval.

Identification is an ongoing process; indeed, public relations must help organizations continually show internal and external audiences their similarities

and shared interests. Companies that cannot maintain identification with audiences are in danger of failing. For example, without the specific connection created by identification the fur industry in the United States is struggling. It is having difficulty convincing people who value animals for more than their aesthetics that fur clothing is desirable. For some audiences today, then, creating identification on the basis of the values of status and prestige is no longer persuasive. The fur industry faces the danger that "if people find that old identifications are unacceptable, they can be persuaded, and even persuade themselves, to abandon them and adopt new ones" (Heath, 2001, p. 377). Savvy public relations practitioners must therefore monitor changing societal values, trends, and norms.

Understanding societal preferences is necessary, inasmuch as Burke saw identification as "compensatory to division" (1969, p. 22). That is, creating rapport between organizations and audiences necessarily involves showing the audiences how they are like the organization in question but different from other companies also seeking to establish common identity. Identification thus requires differentiation, where organizations must distinguish themselves from comparable organizations, arguing that their particular attributes and qualities are unique. Rachael Bright and Alison Henderson (2008) studied the identification strategy in the product and brand identity of a New Zealand-based vodka called 42 Below and noted that its use of "Kiwi" rule-breaking, humorous, and story-telling identifications helped it differentiate its upmarket vodka from its competitors (Absolut, Grey Goose, and

Skyy). 42 Below's choice of identification/differentiation strategies were central in persuading consumers its product was distinct and desirable.

There are a number of ways public relations can attempt to induce identification. George Cheney (1983) devised three prominent strategies that flow from Burke's (1969) original formulation of identification theory. These strategies include (1) the common ground technique, (2) identification through antithesis, and (3) the assumed or transcendent "we." Each works to persuade audience members that they share similar interests. In the common ground technique, an organization links itself to stakeholders in an overt manner. Audiences are told explicitly that they share organizational values—for example, when a company says it has a "commitment to fairness." Identification through antithesis works by demonstrating and uniting against a common enemy. This strategy functions by an "us versus them" mentality, where organizations point out the differences between themselves and a competitor. Finally, identification is created through use of the assumed or transcendent "we." The use of this pronoun and its derivatives calls audiences to see themselves as part of the organization or institution. When we are called to act as Americans, for example, we unite on the basis of this particular strategy's evocation of our national identity. Differing slightly from Burke, M. Cardador and Michael Pratt (2006) looked at identification in terms of bases rather than strategies, arguing that people identify on the basis of relationships, behaviors, or symbols. Their categorization is helpful in understanding how consumers use an organization's products as symbols of self and social identity.

As people identify with institutions when they see that they are alike in some fashion, it follows that these various identifications also work to provide portions of a person's identity. In this sense, identification can function beyond just persuading a person of a message; rather, areas of initial overlap can filter out and constitute portions of a person's self-image. Indeed, as Cheney (1983) noted, "our corporate (or organizational or institutional) identities are vital because they grant us personal meaning" (p. 145). When a person feels he or she belongs to a certain group or accepts a particular name or label for himself or herself, parts of his or her identity become constituted. For example, someone who describes himself or herself as a

Southern Baptist not only identifies with that organization's values but also views society through this lens. In other words, it is possible to become consubstantial with an organization, meaning that both the organization and audience act together. If one is consubstantial with a particular group, he or she shares common motives. In this example, the Southern Baptist perhaps possesses the willingness to act together on the church's mission and goals (see Cheney, 1983, pp. 145–146).

In this way, individual identities can broaden collectively and form groups and coalitions. As Robert L. Heath explained, "Through identification, people develop various collective identities with which they govern themselves and form human relations" (2001, p. 376). Environmental activists, for instance, support the idea of protecting and conserving the earth. Such groups appeal to these values to gain new members and use this belief to differentiate themselves from other societal groups in order to encourage action. Whatever the set of values or norms, if one shares substance, or is consubstantial, with a given group, then that individual is more likely to take action when those values are threatened. Once again, it is clear how closely identification is connected to societal division. People can feel the need to compensate for the stratification of our society and its attendant pressures by belonging to one group or another. Public relations can rely on the identification strategy to help audiences fulfill their need to belong while simultaneously garnering stakeholder commitment to organizational missions.

These audiences are not always external to organizations, however. It is important for organizations to continually induce identification on behalf of their members to ensure success. If a person feels like he or she is a part of a given company and supports its values, he or she is more likely to be a happy and productive employee. Companies work to instill this type of identification in a variety of ways. From corporate newsletters, to team-building outings, to employee recognition programs, public relations assists management to recognize the need to remind employees continually of common interests.

Burke's seemingly simple idea of demonstrating shared interests is quite complex and forms an important part of public relations practice. In a variety of arenas, public relations managers help

craft identifications that support organizational functioning. The concept moves beyond public relations' particular goals, however, and is part of Burke's larger rhetorical theory about the nature of communication. Identification is a central theme in Burke's discussion of rhetoric. In his formulation, identification is a more prominent term than persuasion, as it broadens the role of rhetoric from that of a speaker delivering a persuasive message to one that shows how language, delivered through public relations and other conduits, constructs and reconstructs our realities.

In this way, identification can be broadly understood as a way of viewing society as a whole. Burke saw identification as having a powerful impact on society. He theorized that if identification leads to division, division then leads to societal hierarchy, where certain audience members believe that they are superior to others. This feeling then leads to what he termed mystification, where the audience questions whether some people are truly better, which then leads to victimage. In the victimage part of the identification cycle, audiences symbolically purge the guilt felt that they may not be as good as others by blaming a scapegoat. This feeling is followed by redemption, or purifying through projecting guilt, leading once again to a state of similarity and consubstantiality (Burke, 1969). Since Burke believed that no form of communication is exempt from motivation, he wanted to reveal the ways in which communication or rhetoric influences motives. Burke believed that rhetoric must investigate the symbolic means of ideology that can both create cohesion within a community and maintain divisions between them. Identification is this symbolic means.

The public relations use of the identification strategy should be viewed with caution. While capable of producing such powerful associations and divisions in society, it is important to understand how encouraging identification around a given issue or person can have more than immediate or short-term impact and can shape society as we know it. When applied thoughtfully, however, identification becomes a powerful public relations strategy. The benefits of showing audiences how an organization has their best interests in mind are difficult to overstate.

IDENTITY THEORY

Identity is a topic of interest in public relations scholarship. It is derived from research streams that position identity as a social construction that emerges through social interaction and that only exists in relationship to binaries.

This understanding of identity is rooted in social construction, the belief that the dialectic between social systems and individuals creates the categories that individuals use to define themselves and the categories that society constructs to define them. Thus, we have fragmented avowed and ascribed social identities. Social identity is defined by Blake Ashforth and Fred Mael (1989) as the pieces of one's self-concept that have been assimilated into particular social groups; as Blake Ashforth, Spencer Harrison, and Kevin Corley (2008) noted, "Social identities are shared by members and distinguish between groups" (p. 327). The categories that people use as boundaries defining who is inside or outside of select groupings depend on the members' characteristics. Bey-Ling Sha (1995) pioneered the

research into the avowed and ascribed identities of publics. Avowed identities are “self-actuated and self-defined” (Curtin & Gaither, 2007, p. 171); these identities are cultural or ethnic associations and affiliations declared by an individual. Ascribed identities are those identity markers that an individual uses to perceive other individuals and groups based on their appearance or character. The concepts of avowed and ascribed identities are helpful in understanding multiple identities and how those are enacted when communicating with publics or when public relations practitioners are in organizations.

Identity and Professionals

Bey-Ling Sha, Natalie T. J. Tindall, and Ting-Ling Sha (2012) argued that professional identity can be considered in two ways: the “extent to which practitioners may identify with the public relations profession” (p. 77) and a holistic examination of the identity attached to the field. Regarding the former, Katerina Tsetsura (2010) explored the application of social construction to public relations thought and practice, finding that “social construction can establish a theoretical basis for understanding public relations as an activity and as a field, and for understanding the identity of the working professionals, the institutions they represent, and the people affected by that construction process” (p. 163). Regarding the latter perspective, B.-L. Sha et al. (2012) used B.-L. Sha’s avowed and ascribed identities to define the identities of the practice of public relations. Public relations via academic and practical avowed definitions is defined as a professional practice that is both ethical and managerial, while the professional identities ascribed by news media and critics to public relations are negative.

Identity Theory and Situational Theory

Constraint recognition, level of involvement, and problem recognition—the three independent variables of the situational theory—traditionally are used to predict whether information seeking or information processing occurs with certain publics. These variables do not fully predict active communication behavior, according to Linda Aldoory and Bey-Ling Sha (2007). One forgotten—and understudied—variable in situational theory is referent criterion, which consists of identity,

previous experience with the situation, and cultural norms. Understanding the cultural axes and identity continua that various publics operate under is critical in the creation of useful messages. Recent scholarship reinvigorated the use of the situational theory of publics’ abandoned variable—the referent criterion—to understand how culture can affect the retention and reception of messages, integrating the idea of intersectionality as a way to better segment and create messages for audiences, and how practitioner’s avowed and ascribed identities transform organizational communication strategies.

Identity Theory and Intersectionality

Through the intersectional prism, identities are viewed as intertwined social locations that “interact and relate to each other to create meaning and relevance in the lived experience” of individuals (B.-L. Sha et al., 2012, p. 76). In summary, intersectionality is the conceptualization of the mutual and inherent relationships as well as power between and among various social groupings and social identities. Intersectionality in public relations research, as articulated by Jennifer Vardeman-Winter and Tindall (2010), matters in the construction and implementation of organizational roles, organizational practices, and publics: “Intersectionality operates on multiple individual levels within the field of public relations creating problems of systemic, consistent subjugation of certain groups for the privilege of other groups” (p. 232). Thus, Vardeman-Winter and Tindall proposed that intersectionality operates within and outside the field and must be analyzed at multiple levels, including intra-industrial, organization-publics relational, and the publics/community level as well as others.

mythic potential, making them a one-word (or few-word) summary or orientation toward the world. The power of ideographs is that they invoke compelling cultural and ideological ideals, capable of shutting down debate and dissension.

Democracy, for example, is an ideograph; when most people hear the word they assume that everyone agrees on their meaning of the term. Although democracies are forged through years of struggle and competing ideological conflicts (every democracy is different), “democracy the ideograph” is used powerfully because it encapsulates a universe of meaning.

Other familiar ideographs, such as family, freedom, justice, and communism evoke similar reactions, which can shut down debate. No one wants to be “anti-family” or “pro-communism,” so when a communicator makes such references, they typically shut down debate and disagreement.

Michael Calvin McGee identified the concept of the ideograph in 1980 as a way to explain how rhetoric and ideology were interrelated. But ideographs have meaning beyond ideology. They urge audiences to agree with argumentative premises because ideographic language is so thoroughly instilled in their worldviews. To disagree with an ideograph, or equivocate, is difficult. Ideographs often calm rather than incite an audience, bringing people to a place of shared, but often illusory, meaning.

Ideographs include ideological words and phrases (e.g., “cancer,” “family,” “freedom,” “liberty,” “privacy,” “property,” “religion,” “freedom of speech,” “rule of law,” and “support the troops”) that have ideological associations and, on the surface, often seem to imply only one thing. Ideographs like enthymemes (logical arguments that rely on an audience mentally filling in missing premises) are difficult to argue with because the listeners or readers of the argument help construct the meaning for the ideological language from their own experiences and beliefs about the world.

IDEOGRAPHS AND RHETORICAL THEORY

Ideographs are a particular type of symbolic form used in persuasive messages. Their power in communication results because they have ideological or

The Symbolic Nature of Rhetoric

The strength of rhetoric is that it enables communicators to draw on powerful, shared symbols. Language is symbolic, and words only have meaning in relation to social construction based on their past uses and generally understood meanings

(denotation and connotation). Ideographs are powerful rhetorical tools precisely because they draw on socially constructed meanings. For public relations professionals, language tools like ideographs, metaphors, syllogisms, and enthymemes allow communicators to more effectively inform and persuade. Just as symbols have powerful associations and meanings (the American flag, a serviceperson in uniform), so too does language.

According to McGee, the ideograph connects language and belief. On their face, ideographs are ordinary language terms that seem straightforward and concrete, such as “family,” or “freedom.” In reality, however, ideographs are high-order abstractions (cf. McGee, 1980, p. 15). Everyone may implicitly accept that “family” is a good thing, however, when family is unpacked—“single-parent families,” “abusive families,” “dysfunctional families,” “same-sex partner families”—we realize that family has many meanings and the details are very important. For example, for a U.S. Republican, family usually means “between a man and his wife” and often implicitly refers only to husband, wife, and children, but not extended family members. For a Democrat, family is often constructed more progressively, and assumed to mean two married people (even if of the same sex), and often assumes a more traditional extended family where grandparents and perhaps even aunts, uncles, and cousins live under the same roof.

Ideographs are effective because of their ambiguity. Everyone believes in freedom of speech and religious freedom, but many believe that their religion is the only true religion or that only people in democracies are “free.” By invoking an ideograph, a persuader avoids the subtleties that can emerge in a debate over common ground.

Ideographs have meaning because of individual and group’s lived, cultural, experiences. “Free speech,” for example, probably has more meaning to a journalist than a blogger; however, both journalist and blogger were probably raised on a similar cultural diet of concepts and principles.

The Power of the Ideograph in Public Relations

According to McGee, individuals and leaders who speak for the people invoke ideographic language because of their power to describe a situation and

because ideographs like symbols and enthymemes, are so hard to debate. How can someone argue against “liberty” or “privacy”? Who would argue against a goal that included “stopping piracy,” or “protecting intellectual property”? Ideographic language is used precisely because it closes off debate. Professional communicators use ideographs because they force opponents to accept their characterization of events.

Public relations professionals are in the business of creating and negotiating relationships between organizations and publics. As such, they speak for many people, and have an obligation to inform and persuade ethically and effectively. As professional communicators, they are storytellers, whose job it is to represent client and organizational interests to stakeholders and publics. The ideograph is a tool for sharing a potentially controversial message in a fashion that quells debate and disagreement. Ideographs are powerful communication tools.

IMAGE

The term *image* is one of the more controversial and confusing terms in the lexicon of public relations. Image is both heralded as essential to an organization and dismissed as irrelevant to an organization. Edward Bernays condemned the concept while others embraced it, and corporations spend millions of dollars a year to build images.

The problem is that image developed a negative connotation for stakeholders. Image has a variety of definitions in the public relations and marketing literature. Multiple definitions are not new in public

relations, but the definitions for image often refer to very different topics. For instance, is an image the messages sent by the organization or interpretations constituted by the stakeholders? For these reasons the terms *reputation* and *reputation management* in both research and practice replaced the term *image*.

Early skeptics discounted the basic idea of an image. Many in public relations felt the concept was irrelevant because it did not affect public relations. Since an image is not tangible, a person cannot touch it; it does not really matter. Efforts and money spent on building reputations were considered wasted. Kenneth Boulding's (1977) early work on image suggested the opposite. He believed that people treat images as if they are real, as if they refer to and interpret something quite real.

Later research conducted in business found an image has significant effects on organizations. Images were found to affect a stakeholder's behavior toward an organization on the assumption that "perception is reality." Early research found images related to stock prices and employee recruitment. Images do matter because they can shape stakeholder behaviors. The problem is not if image matters; it does. The problem is in the use of the term *image* by organizations.

Image has many meanings, but focusing on the negative version of meaning helps us understand how it came to be vilified and ultimately replaced in the public relations lexicon. Carl Botan (1993) noted that the most common definition of image was that of a manipulated representation of an organization that lacked substance or accuracy. This can be termed the shallow use of image representing style over substance. An image was something that an organization or even a nation tried to fabricate. The image was based on what the organization said about itself, not what the organization actually did. Zeta Corporation might promote its environmentally friendly image in advertisements and brochures but do little to help the environment. Jarol B. Manheim and Robert B. Albritton (1984) documented that many repressive nations with "bad images" hired U.S. public relations firms to help place positive stories about them in the U.S. news media without doing anything to change their repressive policies. The organizations or nations "talked the walk," but did not "walk the talk." For an image, actions became detached from

words. The image became a projection that may have no basis in reality. If an organization does not like its image, it can simply try to project (manufacture) a new and better one. An organization is perceived to be whatever it manufactures.

This shallow use of image takes a very simplistic and patronizing view of stakeholders. First, it assumes a one-way ("magic bullet") view of communication. Organizations send messages to stakeholders and assume they receive the image messages and construct the desired image. People have many filters that affect how they interpret messages. It is simply wrong to assume all stakeholders interpret a message in the desired fashion. Practitioners must solicit feedback to see if their messages are being received as desired. Two-way communication is recognized as a much more effective way of developing accurate message interpretations by stakeholders. Second, this shallow image assumes stakeholders are not critical consumers of messages.

In fact, stakeholders do not simply accept whatever an organization says. Stakeholders do evaluate statements made by an organization and form images based on those evaluations, not just through what an organization says.

The negative connotation generated by the shallow view of image is a detriment to public relations. In a field where the focus is on building mutually beneficial relationships, the shallow view of image is counterproductive. Images became associated with pseudorealities and deception. This is an accurate portrayal because words without action are manipulations and inaccuracies. In turn, public relations became associated with building "shallow" images and "spin." An image is not what an organization did, but what it claimed to do. In time, stakeholders come to see through the image and realize the deception, thus damaging the organization-stakeholder relationship. Stakeholders compare words to actions to evaluate an image. When the two do not match, stakeholders then form negative images of that organization. When stakeholders discover Zeta Corporation is not environmentally friendly, they then form negative images of Zeta. Practitioners should not divorce words from actions in the same way as the shallow use of image.

An organization can operate under the flawed assumptions that stakeholders do not discover

their deception—image without action. True, many stakeholders have neither the time nor motivation to investigate every claim made by an organization. However, many activist and public interest groups carefully monitor and report on the behavior of organizations. Through the Internet and news media coverage, those who do monitor organizational actions can spread the word regarding organizational violations between words and actions. For instance, millions of people buy Nike products. A small number of stakeholders investigated whether Nike is living up to its claims of not exploiting workers in Southeast Asia. Activists do monitor Nike's treatment of contract workers and publicize those findings widely in the news media and Internet. There was even a lawsuit filed against Nike for using messages saying it had stopped exploiting workers. The messages were circulated widely to Nike stakeholders, including customers and shareholders. The Internet, especially social media, helps foster an age of transparency for organizations. With easy-to-find information, stakeholders can see through an organization, learn that it is transparent, and discover its inconsistencies between words and actions.

In so many ways the shallow view of image is outdated and inappropriate for public relations. However, negative connotative meanings for words are difficult if not impossible to shake. The deeper views of image that look at it as a process and premise it on matching words to actions is tarnished by the legacy of the shallow view of image. Hence, practitioners and researchers moved to the term *reputation* to reflect the deeper view of image. Reputation management moves away from the flaws of image. Painstaking work has gone into developing measures of reputation so that an organization can monitor how stakeholders actually perceive it and efforts to change reputation are premised on behavioral changes by the organization, not just through presentation of a new message. The misapplication of image by shortsighted practitioners resulted in the death of image as a functional part of the public relations lexicon.

IMAGE REPAIR THEORY

Image repair theory (IRT) was crafted to understand the communication options available to organizations or persons who face threats to their reputation. It is comparable to crisis response. Image repair theory integrated and elaborated work on *apologia* by B. L. Ware and Wil A. Linkugel (1973); on accounts by Marvin H. Scott and Sanford M. Lyman (1968); and on guilt redemption by Kenneth Burke (1970).

Image or reputation is a perception shaped by four factors: what the person or organization has said and done and what others say about and how they behave toward that person or organization. Image is vital because accusations or suspicions of wrongdoing have adverse effects: Corporations can lose business, politicians can lose support and elections, people can lose friends and attract hostility; and at times legal or other sanctions can be applied. Because credibility is important to persuasion, threats to image can damage one's ability to communicate effectively. Because people possess different information about an image, it can vary from person to person.

Image repair messages are needed whenever an image is threatened. A person or organization must determine (1) what accusation(s) or suspicion(s) threaten the image, (2) who is or are the most important audience(s), (3) what arguments are likely to appeal to the audience, and (4) which media to use for disseminating the image repair message(s). One cannot hope to successfully counteract an accusation unless he or she knows the

nature of the accusation. If there are multiple accusations, the person must know them all to decide which must be addressed (and to avoid ignoring an allegation). The audience and their beliefs and values about the accusation are key to developing a response that is likely to be persuasive. The message must be created and disseminated in a medium or in media that reaches the intended audience(s).

Identifying the audience is important. Consider a company accused of pollution. Audiences include the accusers (environmentalists, reporters), people who live near the facility, customers, stockholders, employees, and government regulators. The company must decide which audience matters most (perhaps prioritizing multiple audiences). First, some groups have more power over the company. It should be obvious that shareholders cannot be ignored. Depending on the nature of the alleged pollution and relevant laws, government regulators may be another group that cannot be ignored. Second, these groups have different interests (values). Stockholders are surely concerned about profitability; government regulators are interested in the level of pollution. Environmental groups and local residents might want the company to reduce pollution to zero; however, the law is probably not that extreme and completely eliminating pollution may be prohibitively expensive (bad for stockholders). The company must decide which audiences are most important to persuade.

Once the primary audience is selected, then the company must determine what the selected audiences know. For example, if the company considers government regulators as important, the key question is whether *regulators* consider the alleged problem serious enough to warrant action. If regulators believe pollution is at acceptable levels, image repair messages may not be needed for that audience. On the other hand, if regulators think that there is a serious violation of the law, the company needs to deal forcefully with that concern. Understanding a target audience's beliefs (knowledge) and values helps craft persuasive image repair messages.

Anita Pomerantz (1978) explained that accusations have two key components: (1) an offensive act must have occurred, and (2) the accused must be considered to blame for that act. If nothing happened, or what happened was not bad, there is no threat to image. Similarly, if a person is not to

blame for the offensive act, then there should be no threat to image. Of course, the perceptions of the audience are what matter most. If they *believe* the person performed a wrongful deed, their image suffers, even if the person knows the act did not happen, was not really bad, or that they did not do it. Of course, if any of these things are true, that information can be used in a message to repair the person's image. It is also important to realize that blame can come in many forms: if the person committed the wrongful act, or encouraged it, or permitted it to occur, or perhaps did not prevent the act (inaction). The key point is that a threat to image has two key components: an *offensive act* for which a person or organization is *blamed*.

These elements are important because they help understand the image repair options available. Options for repairing an image threatened by accusation or suspicion are organized into five general image repair choices. The first two, denial and evasion of responsibility, concern blame; the third one, reducing offensiveness, concerns unpleasantness. The fourth, corrective action, can address offensiveness (by repairing damage) or blame (by taking action to prevent the offensive act in the future); and the final option, mortification, accepts responsibility for the offensive act, but asks forgiveness (apologizes). Table 1 illustrates these options (some of which have several forms).

Effective image repair suggests that those who are at fault should admit it immediately and take appropriate corrective action. People want others to take responsibility for their actions, and they want offenders to clean up their messes (and/or prevent future problems). It is wrong to lie, and if (or when) the truth emerges, the offender can be vilified, not only for the original wrongdoing, but also for lying about it. Of course, lawyers argue against admissions that can be used against a company or organization in court. Image repair theory is concerned about how to repair an image; however, people and organizations must consider other goals (i.e., consequences for on-going or future litigation). Of course, those who are innocent of wrongdoing should use that in their defense. Notice that even the innocent can use corrective action. For example, in the early 1980s, Tylenol capsules on store shelves were poisoned, resulting in several deaths; the company introduced tamper-resistant packaging and then switched from capsules to

Table 1 Image Repair Strategies

<i>Strategy</i>	<i>Key Characteristic</i>	<i>Example</i>
Denial		
Simple denial	Did not perform act	Tylenol: Did not poison capsule
Shift the blame	Another person/corporation performed act	Tylenol: A “madman” poisoned capsules
Evasion of Responsibility		
Provocation	Responded to act of another	Firm moved because of new taxes
Defeasibility	Lack of information or ability	Executive not told meeting changed
Accident	Mishap	Tree fell on tracks, caused train wreck
Good intentions	Meant well	Sears wanted to provide good auto repair service
Reducing Offensiveness of Event		
Bolstering	Stress good traits	Exxon’s “swift and competent” clean-up of oil spill
Minimization	Act not serious	Exxon: Few animals killed in oil spill
Differentiation	Act less offensive than similar acts	Sears: Unneeded repairs were preventive maintenance, not fraud
Transcendence	More important values	Helping humans justifies testing animals
Attack accuser	Reduce credibility of accuser	Coke: Pepsi owns restaurants, competes directly with you for customers
Compensation	Reimburse victim	Disabled moviegoers given free passes after being denied admission to movie
Corrective action	Plan to solve/prevent	AT&T long-distance upgrades; promised to spend billions more to improve service
Mortification	Apologize	AT&T apologized for service interruption

caplets even though it was not responsible for the poisoning.

Shifting the blame works best when the target is plausible and when the blame actually shifts away from the accused (e.g., President Richard Nixon blamed the Watergate cover-up on his hand-picked subordinates, which meant he was ultimately responsible). Image repair strategies are not equally effective (e.g., in most cases minimization and provocation are less effective than other options) and more strategies are not necessarily better than fewer ones: The idea is to use the evidence-based strategies that appeal to the audience’s beliefs and values. Some strategies work well together (e.g., good intentions and accident), but

others do not fit together (e.g., “I did not do it” [denial] and “You made me do it” [provocation]).

Any strategy can be used persuasively as well as unsuccessfully. For example, one can offer a heartfelt apology or a perfunctory/insincere apology. The former is far more likely to succeed than the latter. Furthermore, there are limits on the power of persuasive messages. Some acts are so reprehensible that no image repair message can earn forgiveness (although usually over time people tend to forget). It is easiest to repair the image of those who are innocent; it is (and should be) more difficult to salvage images of those who are guilty.

IMPRESSION MANAGEMENT THEORY

Impression management theory takes a humanistic approach to the ways in which people organize their symbolic experience. The theory descends from the symbolic interactionism perspective of sociology and the social cognitive tradition of psychology; its terminology is dramaturgical in nature, revealing its connections with 20th-century dramatism and dramaturgical theory. This theory is fundamental to the study of public relations because it explains why individuals and organizations try to control how others perceive them; it also describes strategies such actors use to achieve this goal.

Although once considered as somewhat aberrant behavior or an unwanted variable created by social psychological research in a laboratory context, impression management theory has gained adherents in many disciplines, including communication studies, cultural studies, health care, linguistics, management, marketing, philosophy,

political science, rhetoric, semiotics, and sociology. In public relations research, the theory was initially considered under *organizational politics* and later as *organizational impression management*. It is now particularly important to public relations in its relationship to the concepts of *corporate impression management*, *image*, and *ingratiation*. Recently, researchers studied impression management through observational studies, experimental studies, field work, case or scenario studies, measures of individual difference, and meta-analysis of existing studies. Such research is guided by the following theoretical foundations.

Symbolic Interactionism

The theoretical foundations of impression management theory extend to George Herbert Mead's sociological works on symbolic interactionism, which declared that both individual and group identity is socially constructed; that shared symbols form the basis for communication; and that human interaction is by nature dramatic, relying on the creation and adoption of social roles in particular situations. This theoretical perspective establishes within the individual a dichotomous relationship between a *real*, underlying self (the *I*) and a reflective self (the *me*), which constructs a self-perception from observing how others respond to the individual's behavior. The influence of this perspective remains evident in the characterization of communicators as actors who construct personae that may or may not display the actors' actual thoughts or emotions.

Social Cognition

Daniel T. Gilbert explained how the social cognitive tradition of psychology further developed impression management theory, elaborating its connections with *attribution theory* and *implicit personality theory*. Attribution theory posits that people infer unknown personality traits and dispositions about others based on behaviors they observe. From extensive experience with the organization of human personalities, observers construct an implicit personality for the other and evaluate the other's behavior accordingly. Impression management is the complement to attribution, claiming that the individual actor works consciously

and unconsciously to shape the behaviors that others see and, thus, the implicit personality that they construct.

Dramatism and Dramaturgical Theory

In *The Presentation of Self in Everyday Life*, Erving Goffman (1959) introduced the metaphor of staged performance, which has remained a dominant metaphor for the theory: Individuals are actors who attempt to control both the situation or scene and the content of the interactions in which they participate. Observers, including interlocutors, are considered members of an audience. The actor is responsible for two kinds of signaling in interaction: that which is *given*, and that which is *given off*. First, the actor actively (though not always consciously) constructs a *front*, or persona, using verbal and nonverbal cues to project either the image of reality that he or she wants the audience to accept, or the image of reality that the audience expects to see. Second, the actor *gives off* expressions that are read and attributed to personality characteristics. Goffman proposed that individuals rely heavily on their own expectations and the expectations of those with whom they communicate to determine what behaviors are appropriate to a given scene. Such performances ceremonially confirm socially accredited values in ways similar to sociologist Émile Durkheim's descriptions of ceremony. Furthermore, to maintain tact and to respect how others present themselves, actors and audiences must be aware of cultural differences.

The scene of a performance, termed *region* by Goffman, refers to the physical, relational, temporal, and situational elements that shape an interaction and, to some extent, determine the acceptability of specific fronts and behaviors. The *front region* refers to the activity that is considered on stage, or visible to a particular audience; for example, Goffman discusses the activity of making work, or of merely looking busy at work in case one is being watched by one's supervisor. In the *back region* or backstage, facts and behaviors of a person that are carefully controlled in the front region are released. For instance, instructors may put on their sunny "instructor faces" for the duration of the class they teach; when they return to their offices and close the door, they are in their

back regions, where they can safely mutter about their students' deficiencies. A location can function as front region for one type of interaction and as back region for another; of course, lapses, errors, and other actors often disrupt the drama.

One of the most interesting problems occurs when the actor cannot protect a desired impression from being exposed to more than one audience at once. At such times, the actor is faced with the challenge of protecting what Kenneth Burke (1969) and Émile Durkheim (1965) describe as the *mystery* of the front—the preservation of an actor's control over the front region. The performer must actively manage the collision of conflicting impressions by employing defensive or protective impression management strategies, one of two categories of strategic impression management. Protective strategies identified by Goffman include shifting to a team performance in which the actor and the onetime audience become a new front region for the benefit of an intruder; a second strategy is to invite intruders into the existing performance as if they belonged there. Neither technique is very effective; acquisitive impression management strategies, or attempts to establish initially favorable impressions, often present a better alternative.

The dramaturgical metaphor of impression management applies to group interaction as well as one-on-one communication. The team, which may consist of a married couple, a social group, a company, or a public relations group, is an entity in and of itself, although many individual performers may comprise it. Teams are defined by two kinds of reciprocal bonds: that of dependence, where all members must actively contribute to a social performance, and that of familiarity, or the recognition of in-group/out-group boundaries. Beyond these boundaries, certain behaviors may jeopardize the performance, the group identity, or the scene itself. Acting together, the team members establish a group identity that becomes one mask, one representation of self, one public (and private) identity.

Increasingly, scholars are investigating the relationship between impression management and self-deception. Researchers are also investigating impression management strategies in both verbal and visual online environments, especially blogs and social networking sites. Of particular interest is the relationship between impression management and online privacy.

Critiques of Impression Management Theory

Like Goffman, who takes a somewhat skeptical perspective of the practices actors employ to safeguard the fronts they build, some scholars have taken a *restrictive view* of the process of impression management, describing it as the intentional deception or manipulation of others by hiding or pretending to be something one is not. However, other scholars take the *expansive view* of impression management, arguing that the mystery in the drama is a necessary element of both personality and relationship. The theory of impression management introduced in Goffman's 1959 *The Presentation of Self in Everyday Life* is based on the very human desire to avoid embarrassment when the impression a performer offers is challenged. However, the dramaturgical metaphor employed in this theory translates semi-unconscious action into explicit intention. While the metaphor serves as a helpful frame for conceptualizing how people control their self-exposure, it implies that individual actors, as well as actors in a team, are fully cognizant of what they do to shape how others see them, as well as why they do so. If taken literally, the intent and awareness implied by the dramaturgical framework is seriously overstated.

IMPRESSIONS

Impressions are a measure of how many potential readers, viewers, or listeners were reached by a placement in media. It is usually equivalent to the circulation number in the case of print (i.e., newspaper, magazine), estimated viewership or listeners for broadcast outlets (i.e., television, radio) or page views and unique visitors for Web content (i.e., online publications, blogs). With broadcast, audience numbers vary depending on the time of the newscast. With print, pass-along rates are often extrapolated and taken into account in addition to merely relying on circulation numbers. Most good media databases (i.e., Vocus, Cision) and monitoring services (i.e., TV Eyes, Critical Mention) provide these numbers. As no service is completely comprehensive, directing inquiries directly to the media outlets is sometimes still necessary. Media buyers also are a good source for these numbers.

The exact number of people reached can never really be determined, but impressions are the closest estimates available, keeping in mind they do not gauge an actual “impression” that individual audience members retain of the media clip and its message. Therefore, while impressions are a good tally of potential audience reach, they cannot definitively predict the actual imprint left by the coverage. Sometimes tone of the piece helps to determine the likelihood of the latter.

Impressions usually come into play as a tool used in the evaluation stage of a public relations campaign or initiative when trying to determine reach. While impressions are considered a good measure by many communicators, other professionals in the field do not consider it to be a valid account of reach due to its decidedly quantitative

nature. A more qualitative approach comes through measuring the actual effect of a news clip, such as inquiries received as a direct result, or measuring a marked improvement in sales, business, or traffic. However, from a statistical standpoint impressions are a useful evaluation tool as potential audience numbers can give practitioners an idea of reach, with higher numbers increasing the odds of message dissemination.

INDIA, PRACTICE OF PUBLIC RELATIONS IN

No adequate discussion of public relations in India can occur without reference to the country's rich cultural mosaic. India is a prime example of "unity in diversity"—a vast and varied land with a rich history of over 5,000 years. The Indus Valley civilization (ca. 3300–1300 BC), considered one of the world's oldest urban civilizations, flourished in the Indian subcontinent (today's northwestern India and Pakistan). Although noted for Hinduism, India is also the birthplace of Buddhism, Jainism, and

Sikhism. After Indonesia and Pakistan, it has the third largest population of Muslims. In addition, India is home to several hundred languages—13 of which are used by more than 1% of the country's 1.2 billion population and 29 languages are spoken by at least 1 million people. Therefore, practicing public relations in a country that is as large and as culturally diverse as India is a challenge of great proportions. Several phases of public relations are discernible in India.

Pre-Independence India

No complete description of public relations in India is complete without recognizing the evidence of similar public relations activities in the land during pre-biblical times. The Indus valley civilization provides archaeological evidence of terracotta and stone seals that the rulers used as tools of communication. Religion provided an opportunity for the use of communication as seen in the founders of Jainism and Buddhism. In fact, an ardent Buddhist—Emperor Asoka—used rock and pillar edicts during his reign (304–232 BC) to propagate Buddhism and publicize social and moral precepts, including social and animal welfare programs. *The Bhagavad Gita*, a guide that offers 18 chapters on how individuals should behave in society, is said to have been given by Lord Krishna to Arjuna between the 5th and 2nd century BC. Further along in history, Adi Shankaracharya used oratory and debates (Ashtavadhana) to propagate his Advaita philosophy between AD 788 and 820.

However, much of India's modern public relations activity occurred in the 20th century. The struggle for independence was a powerful social movement that used many of the principles of public relations and some of the most sophisticated means of communication and persuasion, including the use of vernacular press, effective oratory, and nonviolent protests. The British colonialists established the Central Bureau of Public Information in 1923, which after independence became the precursor to the Press Information Bureau. Publicity was the principal focus of this bureau. A few years prior to independence, corporations like the Tatas, Dunlop, Unilever (Hindustan Lever), and Philips engaged in outreach initiatives using public relations.

Post-Independence India

Independence from British imperial rule in 1947 led to the contentious breakup of the Indian subcontinent into India, West Pakistan, and East Pakistan (East Pakistan became Bangladesh in 1971). After independence, India adopted a more socialistic model for development, instituting Soviet-style five-year plans. The emphasis was on establishing a large public sector whose primary purpose was national development. In turn, this led to what can be called public sector public relations, reflecting the political and economic philosophies of the prosocialist leaders of the day. The central and state governments set up large departments of “information and publicity” that were recognized as the public relations arms of government. The work of these departments often blurred the boundaries between public relations for national development and publicity aimed at maintaining the status quo by engaging almost exclusively on personalities rather than policies of political leaders of the party in power.

As a result, for the first 30 years of independent India the Congress Party remained in power until 1977, when there was a national backlash against the party’s authoritarian rule. The changing of the guard at the center did not herald significant changes in the economic or communication policies, as the new party did not remain in power for the full 5-year term. Through successive governments, public sector public relations continued to dominate the practice. The public relations person was perceived as a “fixer” or one who was in charge of *bandobast* (making arrangements), both within organizations and by the society. Seeking publicity predominantly through media relations was the significant, almost singular, activity of public relations officers (PROs). Not surprisingly, many early PROs were former journalists. The personal influence model continues as before and is widely used in public relations in India. Therefore, the connections that a former journalist brings to the profession are treasured by organizations since research-based, strategically planned, public relations activities are rare.

Post-1991 Public Relations

In 1991, India was forced to liberalize its economy, partly because of weakness in the economy and partly due to pressure from the International

Monetary Fund in return for financial assistance. These policies attracted more foreign investment and spurred privatization, including disinvestment of several public sector enterprises. India’s entry to the World Trade Organization in 1995 resulted in a further spurt in private industry and increased global investments, leading to significant economic growth. Economic development brought changes to the public relations industry, including an influx of some leading international public relations agencies assuming a presence in India. Many leading practitioners and educators agreed that public relations was finally coming of age in this vast country.

Public Relations Today and the Future

Looking to the future, the public relations industry faces many challenges if it is to break the past mold of merely serving a publicity function for organizations and elevate itself as a practice that is deemed useful to the diverse Indian society. India has been, and despite some Westernization in urban areas, continues to be a mosaic of cultures and languages and a diverse environment for the public relations practitioner. If communication is to be effective, this diversity demands specific strategies and techniques tailored to the culture. Well-trained public relations practitioners are needed in order to fill the communication gap that many organizations in India currently experience. In exclusive interviews conducted for this entry, a senior practitioner opined that public relations in India continues to be “mired in tactical media relations and event management.” Another senior practitioner echoed similar sentiments stating that about 60% to 70% of current public relations activity in India are “all about execution and little thinking,” about 20% to 30% are slightly better, and only about 10% of today’s practitioners offer “strategy driven” public relations that is “akin to more developed markets.” This practitioner also identified that public relations specific to the social media was the only specialty area of public relations that had appreciable growth in the new millennium. The array of media available in India, including 24-hour cable channels and social media (with 121 million Internet users and counting), justifies focus on media relations to some extent, even though the current preeminence given to media relations is open to serious critique. The level of literacy in the country rose from 12%

at independence to 74% at the last conducted census in 2011. Along with economic development, this helped expand the Indian middle class to approximately half a billion consumers.

Whereas such a big market might be attractive, especially to investors and corporations, one cautionary fact is that the Indian consumer is more discerning now than ever before. As a result, an increase in activism puts pressure on organizations of all types to be responsive to society and to communicate with various publics. Consumer advocacy groups and consumer forums are established in many urban centers and the federal government was forced by these groups to institute the Right to Information Act in 2005. As noted in the elite interviews by another senior practitioner, all of these elements necessitate that organizations practice more sophisticated forms of public relations: “[T]he industry has to spend more time and money in re-skilling their staff. . . . [T]his is a great opportunity for a top class program in India.” This quote typifies the feeling of many about the lack of good public relations education available on a wide scale in the country, even though it is estimated to be a \$10 billion industry employing over 100,000 practitioners. With at least two competing public relations associations in the country—Public Relations Society of India (PRSI) and Public Relations Council of India (PRCI)—and a popular sense that public sector practitioners have time for such association activities, the industry needs to coalesce around the common cause of developing a well-trained, robust industry that can face the challenges of operating in a diverse internal environment and the context of globalization. The words of one senior practitioner interviewed for this entry sums up the sentiment of most observers that public relations in India “is in serious need of a communications revamp!”

INDUSTRIAL BARONS (OF THE 1870s–1920s)

“The public be damned,” a quote attributed to—albeit denied by—railroad magnate William Henry Vanderbilt in 1882, epitomizes the atmosphere of the United States during its industrial growth from the 1870s through the 1920s. The masses saw evidence to support such sentiments about industrialists who often believed that the less the public knew about their dealings, the better. Thus, grew a restless distrust of the “robber barons,” whose power and wealth were gained and secured for generations during this era, often through the exploitation of labor and natural resources.

The change from an agrarian society to an industrialized one was inevitable. As Scott M. Cutlip noted in *Public Relations History* (1995), in just 25 years—1875 to 1900—the nation’s population doubled; immigration and urban living swelled; mass production processes were introduced; natural resources continued to be discovered and developed; railroads and telegraph wires crossed the country; and the mass media of newspapers and magazines proliferated. These profound changes set the stage for the rise of corporate *public relations*, which according to Cutlip and others was a term first used by the Association of American

Railroads in an 1897 company listing. However, by this time, the railroads' use of public relations tactics was nothing new.

On the contrary, said Cutlip, it was this industry that helped pioneer the profession. The railroads owned by Vanderbilt and others continually used articles, murals, pamphlets, and other means to convince Americans to take the rails westward. In turn, these settlements expanded the business territory of the railroads. However, in order for that expansion to occur, investors had to be secured and transportation by rail had to be shown as safe to a doubtful public. Public relations tactics helped to do just that. By 1860, railroads were no longer seen as experimental, and by the 1870s railroads were enticing people to head farther west. Cutlip detailed how the Burlington Railroad fashioned a campaign that included the use of news releases, philanthropy and community relations, third-person testimonials, letters, and pamphlets to accomplish its business objectives.

In its early years, the railroad industry also understood the power of public opinion and, thus, the power of the press. Cutlip reported that the industry provided free passes to reporters and established a trade journal and Bureau of Information, which served to educate the “press, legislators and the public, as to the true relations of the railway interest to the public welfare” (1995, p. 143). Long before the *two-step flow* theory was posited, the industry used opinion leaders to help win public favor for such issues as route selection, freight and passenger business, and investors. Railroads also made use of speeches, letters of endorsement, and staff-written articles for popular periodicals.

However, railroad industrialists of this era also faced public relations challenges. Indeed, it was the public perception of *us* versus *them*—exemplified by the publicity surrounding examples of the arrogance and greed that were pursued instead of the ideals of humanity and public good—that fostered recognition by giants of industry that the public could not be ignored. For example, the passage of the Interstate Commerce Act of 1887 was the direct result of the pressure exerted (by a group called the National Grange) after the fallout from Vanderbilt's alleged “public be damned” quote regarding express railroad operations' existence due to competition, not private need. Cutlip said

that this act, meant to stem industrial age excesses, resulted in the implementation of public relations programs by utilities and common carriers, because they were among the first industries to experience a public's wrath.

By the turn of the century, tensions between industry elites and workers were further heightened, and Theodore Roosevelt and his Square Deal populism was firmly ensconced in Washington, D.C. By this time, industrialists like financial giant J. Pierpont Morgan saw that courting the president's administration and legislators' favor was not enough. Public opinion also had to be considered.

Indeed, the power of the public to influence business interests was growing, and muckrakers like Lincoln Steffens, Upton Sinclair, and Ida May Tarbell exposed gross injustices forcing executives' awareness of the importance of public opinion and goodwill.

John D. Rockefeller and his Standard Oil Trust were seen as the ultimate example of greed run amok at the expense of the nation. During the 1880s, the Rockefeller trust was the largest and richest manufacturing organization in the world. Rockefeller, who took pride in his positive relationships with fellow Standard Oil executives, believed himself misunderstood by the public and was largely silent to his critics. According to Cutlip, although Standard Oil also employed public relations strategies to influence newspapers and legislators and to plead its case to the public, these endorsements were often provided in exchange for monetary compensation. Following investigative journalist Ida Tarbell's critical work on the history of Standard Oil in 1904, which accused the company of strategically buying public goodwill and favors through charitable gifts, the Standard Oil Trust monopoly was eventually broken by a federal antitrust lawsuit.

The violent labor lockout in Homestead, Pennsylvania, in 1892 also served to underscore the seemingly unfettered power of industry. It was then that former railroad and oil man turned steel magnate Andrew Carnegie and his business partner Henry Clay Frick hired Pinkerton Agency guards and enlisted the Pennsylvania State Militia to help break the world's strongest craft union, the Amalgamated Association of Iron and Steel Workers. The strike at Carnegie-Frick Steel Company ended with 35 dead and hundreds wounded from both

sides. Frick directed the assault on the workers, while Carnegie, once proud of his reputation as a friend to working men, remained quietly distant in his Scottish castle, allowing Frick to take whatever actions he deemed necessary. According to Carnegie biographer Harold C. Livesay, Carnegie never recovered his public reputation.

Although J. P. Morgan is alleged to have said, “I don’t owe the public anything,” it was Morgan who in 1902 called on early public relations practitioner Theodore Newton Vail to help save the American Telephone & Telegraph Company. Vail, who had also worked in the railroad industry and later served as general manager of the nearly new Bell Telephone Company in 1878, was named AT&T president 5 years later. During this time, Vail “made public relations and business history” (Cutlip, 1995, p. 198), as he was the first to formally ask questions about company relationships with the public and customer conflicts or difficulties. Vail subsequently initiated a formalized method for dealing with customer complaints.
